The Dixie group of copper mines and the smelter at St. George have passed into the control of W. F. Snyder, who has made payment of $40,000. Mr. Snyder says he will open up the group to a depth of 200 feet greater than at present. A tramway is projected between the mine and smelter, 12 miles.

WASHINGTON.

OKANOGAN COUNTY.

Brewster reports that E. R. Hurd of New York bonded a group of mines on Kruger mountain for $50,000. He proposes to start a tunnel into the mountain 1200 feet. The ore requires smelting.

SKAGIT COUNTY.

The Thomas Cruse Banking Co. of Helena, Mont., is reported to have bought 1000 acres of coal land in the Crow's Nest Pass mining region, and will put up coke furnaces to handle the product.

SNOHOMISH COUNTY.

Slate Creek has a dividend-payer in the Mammoth mine, which has cleaned up $3750 net, independent of the concentrates, in a twenty-day run of its 5-stamp mill, employing twenty-five men. The 10-stamp on the Eureka, near the Mammoth, is at work.

The Everett News says that a 16-inch vein of telluride has been found by the Northwest Con. M. Co. in the Monte Cristo mining district. Assays show $20 per ton gold in the telluride. The company is putting in a new ore dump and will build a tramway from the mine to the Everett & Monte Cristo Railroad.

YAKIMA COUNTY.

The Big Thunder Mountain Co., operating in the Summit district, has added five more claims to its holdings, the Tessa, May, Flora, Winiped and Gordon, formerly owned by J. L. Higgins.

FOREIGN.

AUSTRALIA.

The gold yield of New South Wales during July amounted to 53,464 ounces, valued at £181,743, as compared with 62,862 ounces, valued at £222,357, during July, 1899. The yield for the last seven months amounted to 209,820 ounces, valued at £728,606, as compared with 245,092 ounces, valued at £845,339, for the same period of 1899.

The Department of Mines reports that the value of the mineral products of New South Wales for the year 1899 amounted to £6,157,000, showing an increase of £1,290,000 as compared with 1898. The total number of miners employed was 40,133.

BRITISH COLUMBIA.

At Moyie, in July, the St. Eugene Con. M. Co. paid out in wages $25,400.

C. R. Hosmer, director Center Star and War Eagle mines, says a deal is on with the C. P. R. R. by which that company was to handle and smelt ore for the mines at a figure which is understood to be $2,000,000 annually. He says that shipments from both mines are being held, pending the signing of the agreement, by which the War Eagle would receive special terms for transportation and smelting. This, he says, would so reduce the cost of mining that it would be possible to profitably mine lower grade ore than had been done hitherto. Under this agreement, it was further added, the War Eagle and Center Star would ship a minimum of 1000 tons per day.

A New York paper says the Cariboo hydraulic gold brick, which recently arrived in that city, was so large that a special smelting pot had to be made for it. "Officials are not pleased with the size of the cone-shaped lump of gold, valued at $135,275, which was sent to the assay office recently, by the New York branch of the Bank of Montreal, to be smelted. The hydraulic miners of British Columbia made the lump so large that Supt. Mason of the assay office will have to order a special smelting pot, in order to have a receptacle large enough to hold this 'king' lump, while it is melted to be run into bars. The weight of the lump—7897 ounces—made the service of four men necessary to place the cone upon the scales."

The Canadian Pacific's smelter at Trail is to be enlarged to double its present capacity, making it able to daily handle 1500 tons ore. The improvements contemplated would cost $200,000. The additions to the plant stated include the following: Six straight-line roasting furnaces, with a maximum capacity on easily roasted ore of 150 tons daily; two lead furnaces, with daily maximum capacity of 250 tons each; one copper furnace, inside measurement 44x160 inches, capacity 300 tons per day; crushing plant to handle 1500 tons per day; buildings, power and blowing machinery, and incidentals.

At Greenwood work has started to brick in the 300-ton furnace at the B. C. C. Co.'s smelter. R. Liden, Asst. Supt., says that within six weeks after the delivery of the machinery he will have the smelter ready to be blown in. Three thousand feet of 8-inch piping will be laid to bring water from Copper creek to the smelter.

In the Atlin district the Willow Creek Co.'s clean-up July 31st was forty pounds of coarse gold, beside a quantity of amalgam. The Wright Creek Co. has shut down on account of lack of water. Spruce is the most generally worked creek in the camp.

The furnaces of the Granby smelter at Grand Forks were blown in this week. The sampling works has also begun operations.

MEXICO.

Three years ago the owners of the El Trianon mine at El Oro sold to the American M. Co. of the same place its property for $10,000. Since the American M. Co. purchased the Trianon property it was sold by J. B. Haggin to the Exploration Co. of London. Last March the former owners of the El Trianon Co. claimed that the sale of the mine was illegal and asked that it be cancelled. They now have decided to begin suit against the El Oro M. & R. Co. to cancel the sale of the Trianon property.

In the San Pedro district, Sonora, T. A. Kelley has the San Nicolas, Number Ninety-nine and the Cobriza under lease. He has 200 men taking out ore. He is taking out of the San Nicolas 450 tons per month. Smelter returns on this output are as follows: Sixty ounces silver, .09 ounce gold, 5% lead, 7% copper, 26% iron and 14% silica. He has a lease on the Ninety-nine prospect and is shipping fifty tons a month from it. Smelter returns are as follows: Forty-five ounces silver, .25 ounce gold, 4.5% lead, 16% copper, 22% iron and 21% silica.

The Durita is under lease to E. H. Wells. He has men producing 300 tons per month. His smelter returns are as follows: Fifty ounces silver, .09 ounce gold, 8.5% lead, 4% copper, 25% iron and 18% silica.

SOUTH AMERICA.

At San Diego, Cal., on the 22d, arrived the steamer Tanis with 6930 sacks of silver and lead ore from the Antofogasta, Chile, on its way to the smelter in Pueblo, Colo.

THE KLONDIKE.

From Dawson Wilson Foster writes the Victoria Times under date of July 30th regarding the new quartz strike in Indian River district: "I saw the samples and an assay certificate showing $2 per ton from one sample and $5 from another. It is now sixty days since the strike was made, and there is no shaft being sunk, not $100 worth of work done, even to serve as assessment work. It would be criminal to allow exaggerated reports of untold wealth in quartz finds to go abroad uncontradicted and cause another wild stampede of "Cheechakos" or "tenderfeet" into the Klondike. We have as many people here now as we need until more work has been done to develop this country. This is not a poor man's country. In fact the poor man has no country! As soon as a poor man strikes it rich he either goes insane, drinks himself and dissipates himself into an untimely grave, or becomes just as arrogant, greedy and insulting as his wealthy brothers in other camps, and tries to swallow up the whole creek, pay-streak, gravel and all. This is not a personal remark, and there are few exceptions to this rule. There are at least 1000 prospectors for quartz in the Klondike. The Alaska Exploration Co. has already spent $100,000 cash in quartz prospecting."

The statement that the Dominion Government had abolished the 10% royalty in the Yukon, substituting therefore a 3% tax establishing a compulsory assay office in Dawson, is officially denied by the Minister of the Interior.

Personal.

E. D. BOYLE of Nevada county, Cal., is visiting San Francisco.

S. T. MURCHIE has returned from Colorado to Nevada City, Cal.

ELMER DE VORE has returned from Joplin, Mo., to Cripple Creek, Colo.

VICTOR M. CLEMENT is examining mining property at St. Anthony, Idaho.

J. R. DELAMAR has gone to Paris and will return to California in November.

T. C. GORRIE has been appointed Supt. San Ysabel mine, Tuolumne county, Cal.

C. C. THOMAS, Supt. Sútro tunnel, is reported seriously ill at Los Angeles, Cal.

PAUL JOHNSON will return from Europe to the Greenwood, B. C., smelter Sept. 10.

W. H. WATTS will have charge of the $40,000 Risdon dredger at French Gulch, Mont.

A. J. BOWIE has returned to his Sansome St., San Francisco, office from the Klondike.

W. E. KOCH, general manager La Lustria M. Co., El Oro, Mexico, has returned from New York.

O. O. HOWARD, JR., has returned to California and will develop his Shasta county property.

F. W. KROGH has returned to San Francisco from his mining property in Plumas county, Cal.

SHERMAN BELL is appointed assistant manager Independence-Wilson Creek Con., Goldfield, Colo.

JNO. DERN of the Con. Mercur, Utah, sails from Hamburg, Germany, for Salt Lake on the 15th prox.

A. M. ROBESON succeeds the late Maj. Seymour as consulting mechanical engineer for the Rand Mines Co., S. A.

C. M. FASSETT left San Francisco on the 22nd to put in a cyanide plant for his cousin, J. Sloat Fassett, of New York, on the latter's Corean property

BEN STANLEY REVETT continues as general manager of the North American Dredging Co. at Breckenridge, Colo.

C. L. FREED has gone to Inyo, Cal., to take charge of the property of the Ballarat M. Co., recently acquired by him.

WM. MCKINLAY, SR., late Supt. Providence mine, Nevada county, Cal., will make his future residence in San Francisco.

HAROLD W. FAIRBANKS, Ph. D., has returned to Berkeley, Cal., from an extended geological reconnoissance through California, Oregon and Washington.

W. E. STOVER AND F. E. MANSFIELD of San Francisco and F. F. Sharpless, late of Madera county, Cal., are examining mining properties in the Oro Blanco, Ariz., district.

T. F. VAN WAGENEN has recently been making a professional examination of the new developments in the down-town region of Leadville, Colo., where he has some interests.

T. C. ARCHER, formerly Supt. Iron Mountain, Cal., mine, has returned to San Francisco from Alaska, and may return there to take charge of copper developments near Juneau.

H. D. SCRIBNER, contracting agent of the Westinghouse Electrical Co. of San Francisco, is in Spokane, Wash., promoting the project of electric power transmission from Post Falls to the Cœur d'Alene mining district.

A. F. WILLIAMS, a graduate from the College of Mining in the University of California in 1898, has been appointed assistant general manager of the De Beers Con. Mines, Ltd., Kimberly, South Africa, at an annual salary of $6000.

J. A. YERINGTON has been appointed Nevada's Industrial Agent for the Southern Pacific Co. His duties are "to inquire into the mineral resources of the State and arrange for transportation of ores at rates that will leave a profit to the shippers."

Obituary.

F. HOWELL, said to be the oldest miner in California, died at his home in Placer county on the 18th inst.

J. W. E. TOWNSEND, well known in almost every mining camp on this coast as a newspaper man of ability, and also as the editor of the Bodie Miner-Index, died at Lake Forest, Ill., Aug. 10th, aged 78.

GEORGE FERRIS, two-thirds owner Ferris-Haggerty copper mine, Battle Lake, Wyo., was instantly killed on the 18th in a runaway accident near the mine. He had been directing men fighting forest fires. Mr. Ferris was thrown to the ground with great force and his skull crushed. Recently Eastern men secured an option on his mine for $2,000,000, and on the day of his death he received word that a representative of the purchasers was en route to the mine to close the deal.

Commercial Paragraphs.

IT must have been a poor exhibit that could not take a prize at Paris. There were 2827 grand prizes, 8166 gold medals, 12,244 silver medals, 11,615 bronze medals and 7938 honorable mentions—a total of 42,790 awards.

THE Pacific Tank Co. of San Francisco and Los Angeles, Cal., has shipped a twenty-five-ton plant to Korea for the Oriental Con. M. Co., a fifty-ton plant to the Helena G. M. Co., Callahans, Cal., a fifty-ton plant to the El Dorado Cyanide Co., Browns Valley, and a carload of leaching tanks to the Mt. Lion G. M. Co. of Republic, Wash., and are constructing a twenty-five-ton plant for the Jersey Blue M. & M. Co. of Ohio City, Colo.; have under construction a chlorination plant for Bodie, Cal., and two ten-ton plants for Mexico, and are shipping this week a plant of thirty-five-ton capacity to the Athabasca M. Co., B. C. This plant is calculated to treat tailings direct from the battery, and consists of two large settling tanks, with automatic distributors, five leaching tanks and all necessary solution, sump, vacuum tanks, zinc boxes, etc.

Catalogues Received.

APART from the practical character of the catalogue on mining machinery recently sent out by the Edw. P. Allis Co. of Milwaukee, Wis., the style of its publication is good illustration of the advance in that kind of mechanical treatise. The engravings are of the same high-class grade one expects to see in the best magazines. Evidently the Allis people believe that if a thing is worth doing at all it is worth doing well, and a concern that goes to such expense in a trade treatise may justly claim favorable notice for what it makes for miners.

List of U. S. Patents for Pacific Coast Inventors.

REPORTED BY DEWEY, STRONG & CO.,
PIONEER PATENT SOLICITORS
FOR PACIFIC COAST.

FOR THE WEEK ENDING AUG. 14, 1900.

656,080.—PAINTING MACHINE — B. W. Augustine, Alameda, Cal.
655,921.—LOCK—P. V. Cornils, S. F.
655,924.—WEED CUTTER—J. G. Evans, Waitsburg, Wash.
655,859.—HARROW — J. F. Fay, Geyserville, Cal.
656,104.—MOTOR REGULATOR — J. D. Fricot, S. F.
655,864.—SELF-LIGHTING CIGAR — B. Heimann, S. F.
655,777.—ELECTRIC SIGN — A. Heiny, S. F.
655,868.—CUTTING METAL SHAVINGS—A. Holtgen, S. F.
656,118.—GAS LIGHTER — Jones & Barrett, S. F.
656,124.—DENTAL MALLET—U. G. Kinnison, Aberdeen, Wash.
655,793.—QUARTZ MILL—A. T. McMurtrey, Medford, Ogn.
655,906.—CLUTCH—J. A. Moore, Paauhau, Hawaii.
656,038.—EYE SHADE—H. E. Newton, Los Angeles, Cal.
655,888.—FLUSHING WASTE PIPES—W. T. O'Neil, Etna, Cal.
655,916. — TELEPHONE SYSTEM — W. Torst Jr., Los Angeles, Cal.
656,147.—AIR COMPRESSOR—J. W. Van Brocklin, Seattle, Wash.
655,842. — PREPAYMENT METER — F. Weegmann, S. F.
656,131.—ADVERTISING DEVICE—P. E. White, Los Angeles, Cal.
656,071.—R. R. RAIL JOINT—C. Whitmore, S. F.
655,747.—VACUUM APPARATUS—G. W. Winckfield, Alameda, Cal.
33,077.—DESIGN—U. E. Lemon, Fairfield, Wash.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

APPARATUS FOR CUTTING METAL SHAVINGS.—No. 655,868. Aug. 14, 1900. August Holtgen, San Francisco, Cal. One-half assigned to W. E. Hampton, same place. This invention is designed to cut sheets of metal into thin shavings. It consists of a journaled arbor with means for applying power to revolve it, means for securing one edge of the sheet of metal to the arbor so that the sheet may be coiled thereon to any desired thickness, a cutting tool, and means for advancing it parallel with the arbor so as to cut shavings from the end of the roll of metal. The tool-holder comprises two parts, one of which is slidable in guides parallel with the arbor and the material to be cut, and the other is screw-threaded, hinged and closable upon the first portion and also upon the feed screw which passes through the tool-holder. The end of the feed screw carries a ratchet wheel and a pawl is eccentrically mounted upon the arbor so as to turn the ratchet wheel at each reciprocation and thus rotate the feed screw and advance the tool-holder by small progressions so as to make a continuous cut of the metal coiled upon the arbor.

SELF LIGHTING CIGARS.—No. 655,864. Aug. 14, 1900. B. Heimann, San Francisco, Cal. One-half assigned to I. Dannenbaum, same place. This invention relates to a cigar carrying upon itself a means for its ignition without the use of matches. It consists of a specially prepared compound of ignitable material mixed into a paste and incorporated with the ends of the rolled leaves of the cigar so as to form an essential part of the structure. The cigar being rolled, this saturated end can at any time be ignited by rubbing it upon a surface prepared for the purpose, and which will through its chemical action upon the compound on the cigar cause the latter to ignite. It is very convenient for windy or difficult situations.

VINEYARD HARROW. — No. 655,859. Aug. 14, 1900. J. F. Fay, Geyserville Cal. Assignor one-half to W. S. Vaughan, same place. The object of this invention is to provide a harrow which is especially designed to be used in vineyards. For such purposes it is necessary that the side frames of the harrow carrying the teeth should be adjustable to stand at different angles with relation to the central support, and the ground over which they travel. For this purpose the harrow is constructed with a central longitudinal beam with draft attachments and two or more parallel toothed beams are located upon each side of the draft beam, and diverge from front to rear with relation to this beam. They are rigidly secured by angle plates at the front and transverse uniting plates at the rear. Loose link connections between the front and rear ends of these toothed beams and the draft bar allow them to tilt to suit the surface of the ground, and a lever fulcrumed at the rear of the draft bar is connected through transverse levers so as to raise and lower the tooth beams to stand at any angle with the draft beams. They can then be locked in any position of adjustment.

Latest Market Reports.

SAN FRANCISCO, Aug. 23, 1900.

SILVER—Per oz., Troy: London, 28¼d (standard ounce, 925 fine); New York, bar silver, 61⅜c (1000 fine); San Francisco, 61⅜c; Mexican dollars, 49¼c.

COPPER.—New York: Lake, 1 to 3 casks, 16.75 cash; carload lots, 16.50; Electrolytic, 1 to 3 casks, 16.62½; carload lots, 16.37½; Casting, 1 to 3 casks, 16.50; carload lots, 16.30. San Francisco: 17. Mill copper plates, 20c; bars, 22@23c.

Visible supply of copper in England on Aug. 15th was 32,460 tons—an increase of 3547 tons in the first half of the month. Supplies for the half month were 12,915 tons and deliveries 9368 tons. February 1st was the low point in supply this year, with 21,327 tons; it has increased steadily since to 32,460 tons Aug. 15th, or 11,133 tons in all since Feb. 1st—50%. The influence of the heavy American exports of copper evidently are telling on the building up of supplies. The supply Feb. 1st was down nearly to one month's consumption. Since then Europe has absorbed an immense amount of American copper. For the first seven months of 1900 no less than 101,903 tons have been exported from the United States—nearly two-thirds of the entire American production of 157,592 tons, against much less than one-third in the same period last year.

LEAD.—New York, $4.25; Salt Lake City, $4.00; St. Louis, $4.20; San Francisco $5.00, carload lots; 5½c 1000 to 4000 lbs.; pipe 6¾, sheet 7½, bar 6c. London, soft Spanish, £17 15s.

The Treasury Department reports that for the fiscal year ending June 30, 1900, the imports and exports of lead were as follows:

	Pounds.
Imports	196,378,961
Exports	166,254,778
Foreign lead remaining in U. S.	30,124,183
Lead in warehouses June 30, 1899	17,399,593
Lead in warehouses June 30, 1900	33,836,374
Increase in warehouses during last fiscal year	16,436,781
United States consumption of imported lead last year	13,687,402

In line with the A. S. & R. Co. the Guggenheims guarantee their sellers $4 per 100 pounds for all the lead they may produce for the remainder of 1900—the $4 rate to apply to all settlements that have been made since Aug. 1st, on which day the agreement with the A. S. & R. Co. went into effect.

Replying to a question asked by the Salt Lake Tribune as to the application of the agreement by which the lead producers of Utah are to receive $4 per hundred during the balance of the year for their product, Manager Jones of the A. S. & R. Co. said it was open to all who appear in the Salt Lake market, whether they come from Idaho, Nevada, Wyoming, New Mexico or Colorado, or from the Dominion of Canada on the north. What agreement, if any, is governing the market at other smelter points, Manager Jones did not know, as he was not supposed to be concerned in the affairs of those outside of his own jurisdiction, which is confined to the Salt Lake plants.

Messrs. Guggenheim will pay $4 per hundred pounds in every market entered by them, whether it be in Idaho or Montana, Nevada or Wyoming, Colorado or New Mexico.

J. H. Weddle, manager of the Arkansas Valley plant of the A. S. & R. Co., explains how the $4 per hundred rate was brought about: "For some time past the production of lead in this country has been very heavy. This naturally tended to send the price down considerably below $4, and the only way that the market could be sustained was to export the metal. This, of course, had to be done at a loss, in order to compete with the foreign market. Some time ago, at the instance of the big lead producers of the Cœur d'Alene country, a conference was held with the officials of the A. S. & R. Co., and a plan agreed upon for making a stable price. The lead miners generally throughout the West have accepted the proposition, and the result is that all lead purchased by the company will be paid for at the rate of $4, the agreement to last until the end of the year. It makes no difference what the market price is, the figures will remain the same to the miner. In order to bring about this the A. S. & R. Co. will have to export the lead at a loss of 12½ cents, the only way the company has of recouping being in case there is a strong advance. Had this arrangement not been made," Mr. Weddle continued, "the present price of lead would be about $3.50 or $3.60. Now, however, the miner is assured of a stable price at a steady figure, and a figure, too, which should enable all lead properties in the district to be worked to a profit. The miners have all accepted the proposition, for it certainly is a just and equitable one under the circumstances. The company simply assumes whatever loss there may be in exporting, and in this way the price is sustained. Otherwise it would certainly go down."

SPELTER. — New York, $4.15; St. Louis, $4.10; San Francisco, ton lots, 5½c; 100-lb lots, 5¾c.

ANTIMONY.—New York, Cookson's, 10¼c; Hallett's, 9½c; San Francisco, 1000-lb lots, 12c; 300 to 500 lbs., 13@14c; 100-lb lots, 15@18c.

IRON.—Pittsburg, Bessemer pig, $16; gray forge, $14.50; San Francisco, bar, per lb., 2¾c. in small quantities.

STEEL.—Bessemer billets, Pittsburg, $18.00; sheet bars, $22; San Francisco, bar, 7c to 12c per lb.

Structural material manufacturers at Pittsburg this week ordered a cut of $8 per ton in all shapes and sizes, effective at once. It is another move growing out of the Gates maneuver on steel and wire. It was learned that some of the big combinations had broken into the structural material trade. The minimum of the structural schedule was $1.90 for 15-inch beams and under, but the material that was competing with the pool was selling for $1.30 for similar sizes. Should the others meet the cut of the pool, there is no telling where the end will be, as the associated manufacturers are determined to maintain control of the product.

QUICKSILVER. — New York, $50.00; large lots: London, £9 5s; San Francisco, local, $48 ℘ flask of 76½ ℔s.; Export, about $45.

From July 1 to August 19 there were received at San Francisco 2042 flasks.

MAGNESIUM.—New York, $3.00 ℘ ℔.; San Francisco, $4.00.

ZINC.—San Francisco, 5½c; slab, 6c; bar, 7¾c.

SOLDER. — Half-and-half, 100-℔. lots, 21c; San Francisco, Plumbers', 100-℔. lots, 17¾c.

BABBITT METAL.— San Francisco, No. 1, 10c.

TIN.—New York, pig, $31.75; San Francisco, ton lots, 33c; 1000 ℔s., 33½c; 500 ℔s., 34c; less, 35c; bar tin, ℘ ℔, 40c.

ASSAY LITHARGE.—San Francisco, 10c ℘ ℔, small lots.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 35c.

PLATINUM.—San Francisco, crude, $17 ℘ oz.; New York, $18.25; manufactured, $19.50@22.00.

BISMUTH.—New York, ℘ ℔., $1.60 50-℔ lots; San Francisco, $2.50 to $2.75 ℔ lots.

NICKEL.—New York, 50@60c ℘ ℔.

TUNGSTEN.—New York, ℘ ℔., 95c; San Francisco, $1.15.

FERRO-TUNGSTEN. — New York, 37%, 35c; San Francisco, 65c (60%).

FERRO-MANGANESE. — Pittsburg, 80%, domestic, $85, large lots.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 32½@34½c ℘ ℔.; carloads, 31@32c; in 10-℔. tins, 40c; sulphuric acid, 66% B, 2c ℘ ℔.; soda ash, $1.60 ℘ 100 ℔s. 58%; hyposulphite of soda, 2¾@3c ℘ ℔.; blue vitriol, 5½@6c ℘ ℔.; borax, concentrated, 7@8c ℘ ℔.; chlorate of potash, 12@13c; roll sulphur, 6c; alum, $1.90@2.00; flour sulphur, French, 2¼@2½c; California refined, 1¾@2c; nitric acid, in carboys, 8c ℘ ℔.; caustic soda, in drums, 3@4c ℘ ℔.; Cal. s. soda, bbls., $1.00; sks, 95c ℘ 100 ℔s.; chloride of lime, spot, $2.50@2.60; nitrate of potash, in kegs, 8c; caustic potash, 10c in 40-℔. tins.

OILS.—Linseed, pure, boiled, bbl., 79c; cs., 84c; raw, bbl., 77c; cs., 82c. Deodorized Stove Gasoline, bulk, 16c; do., cs., 22c; 86° Gasoline, bulk, 21c; do., cs., 27c; 63° Naphtha or Benzine, deodorized, in bulk, per gal., 15½c; do., in cs., 21½c; Lard Oil, Extra Winter Strained, bbl., 60c; cs., 65c; No. 1 bbl., 49½c; cs., 54½c; Neatsfoot Oil, coopers' bbls., 60c; extra bbls., 55c; cs., 60c; No. 1 bbl., 52½c; cs., 57½c.

POWDER.—F. o. b. San Francisco: No. 1. 70% nitro-glycerine, per ℔., in carload lots, 15¼c; less than one ton, 17¼c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11¾c; less than one ton, 13¾c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2 per keg.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9, in lots not less than 1000.

FUSE.—Triple tape, $3.60 per 1000 feet; double tape, $3.00; single tape, $2.65; Hemp, $2.10; Cement No. 2, $3.00; Cement No. 1, $2.65, in lots of 3000 feet and up.

CAPACITY OF WAGONS 16 TONS EACH, or total freight carrying capacity of train 50 tons.

CAPACITY OF ENGINE, 50 H. P.

THESE WAGONS ARE ESPECIALLY DESIGNED FOR STEAM FREIGHTING.

CAPACITY OF TRAIN, 50 TONS.

"The Daniel Best" 50-Horse Power Traction Engine.

The most powerful and only Successful and Practicable Road Engine in the world. Eighty of them in use on this Coast. They are being Successfully and Profitably Employed in Hauling Logs, Lumber, Ore, Salt, Borax and other kinds of freight.

The work is being done **FIFTY PER CENT** Cheaper than it is possible to do with Animal Power. They can be operated over any ordinary road where it is practicable to use mules or horses, doing the same work. They can ascend grades as much as 10% to 20%, hauling their loads of 35 to 40 tons, depending upon the condition of the roads; loads may be increased to even greater amount on a firm and moderately level road.

Send for descriptive Circulars and Price List of Engines and Wagons. We solicit correspondence. No trouble to answer questions.

Estimates made for complete Steam Freighting Outfits. Address

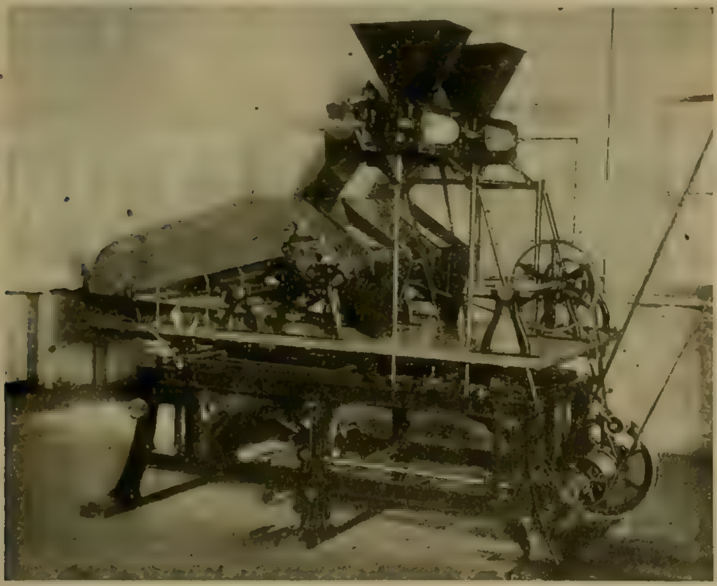
THE BEST MANUFACTURING CO.,

San Leandro, Cal., U. S. A.

CROWN GOLD MILLING CO.

Manufacturers of the "CROWN" CONCENTRATOR and CROWN ORE SIZER. A dry process of sizing and concentrating ore, sand or gravel. Designed to accord fully with the laws of specific gravity, and especially adapted to refractory ore or localities where there is no water.

The chief claims for the Crown Concentrator are that it occupies less floor space and has nearly four times the capacity of any wet concentrator; that it will concentrate ores containing base and refractory metals that ordinarily slime and carry off values; that it effects a saving of values far above the ordinary methods of concentration.



We have, now in operation, a complete plant for crushing, sizing and concentrating ores by the

Crown Dry Milling Process.

Mine owners desiring tests made can forward us, freight prepaid, not less than 1000 lbs. nor more than 4000 lbs. of sample, for which a charge of $20 will be made. (This amount includes assaying, etc.)

Ores for which this process is adapted and of which consignments are solicited are any concentratable ores, pulps, tailings, or sands, carrying sufficient values, whether they have heretofore been profitably concentrated or not.

SAN FRANCISCO, CAL.

THE FULTON VARIABLE MOTION CONTINUOUS FLOW MINING PUMP.

Delivers a continuous stream with absolutely no water hammer so common with all other makes of pumps. Is particularly adapted to be driven by electric power, for the reason the resistance to motive power is almost uniform. I manufacture the **FULTON PUMP** in four sizes, ranging from 10 H. P. work to 50 H. P. work.

WRITE ME FULL PARTICULARS IN REGARD TO YOUR REQUIREMENTS.

The above cut is made from a photograph taken of a No. 3 FULTON PUMP at work on the 600 ft. level in the Tesla Mine at Tesla, Alameda Co., Cal.

Read what MR. O. NEWHOUSE, Consulting Engineer of the S. F. & S. J. Coal Co., has to say in regard to it.

OFFICE S. F. & S. J. COAL CO., TESLA, ALAMEDA CO., CAL., July 13, 1900.

Mr. A. T. Ames, Galt, Cal.—DEAR SIR: Replying to your favor of recent date, regarding the working of the Fulton Pump bought of you, will say: The pump is one of your No. 3 pumps, working in connection with a Fulton Double X, double plunger cylinder 5 in. diameter by 110 in. long; stroke of each plunger 2 ft. This pump is installed in our mine on the 600 ft. level, directly over our sump, and is forcing the water to the surface at one lift. We drive the pump with an electric motor, 30 H. P., connected direct to the pump with gear and pinion, and I am pleased to submit the following statement of duty:

Length of 6 in. column leading up incline to surface	805 ft.
Perpendicular head	640.88
Gauge pressure, actual	275 lbs.
" " theoretical	278.14 "
Barometer at pump	29.58 in.
" point of discharge	28.95 "
Temperature air	58 deg.
" water	76 "

Strokes double per minute, 2 ft	25
Discharge, measured by box center thereof, under 5 in. head, equal to 1⅙ cu. ft., equal to gallons per hour	4725
Diameter of pump cylinder	5 in.
Net area of pump cylinder after deducting area of piston	17.868 sq. in.
Efficiency of pump when working under above conditions	84.80 per ct.

To say that we are highly pleased with our pump expresses it very mildly.

Signed, O. NEWHOUSE, Consulting Engineer S. F. & S. J. Coal Co.

Manufactured and Sold by A. T. AMES, Galt, Cal.

MANUFACTURED BY
THE WESTERN CHEMICAL CO.
DENVER, COLO.

For Chlorination, Refining and other processes. Also Muriatic and Nitric Acids, Blue Vitriol, Copperas Commercial and C. P. Our chemically pure Acids and Ammonia are guaranteed perfect.

NO TROUBLE TO OPERATE--A BOY COULD RUN IT.

TO ASSAYERS:

This is our DOUBLE MUFFLE FURNACE, No. 37. The lower muffle is 10x16x6 inches, and will hold eight 20-gramme crucibles. The upper muffle is 6x12x4 inches.

One Cary burner, size 2 1-4 inches, heats both muffles simultaneously.

Starting with a cold furnace and burner, the first batch of eight crucibles can be poured in less than one hour from time of lighting match, and same cupelled in one hour and a half.

When furnace has become thoroughly heated, melts may be made every twenty minutes and cupellations every twenty-five minutes.

SMOOTH-ON TRADE MARK CASTINGS.

An iron cement for repairing leaks or fractures in steam or hydraulic work. When hard it will withstand a red heat, steam, water or oil, and expands and contracts with heat and cold the same as iron, insuring a tight joint at all temperatures. Difficult flange connections can easily be made with Smooth-On, as it adapts itself to the flanged faces whether parallel or not. Connections are easily taken apart. Unequaled for boiler patching, and repairing blemishes in iron castings. Write for catalogue and prices. Sole proprietors and manufacturers: Smooth-On Mfg. Co., Jersey City, N. J., U. S. A.

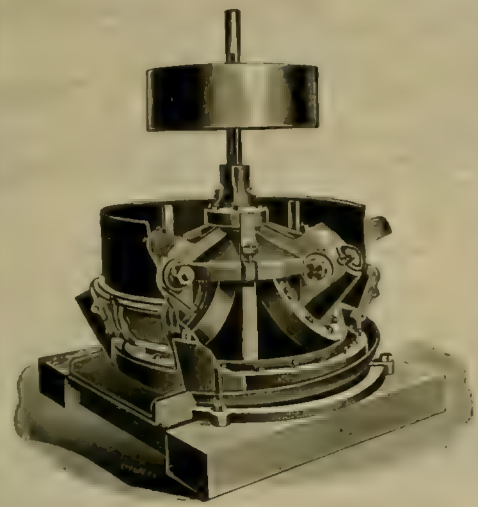
MUSIC BOX AND FINE SPRINGS OUR SPECIALTY.



THE GRIFFIN
THREE ROLLER
ORE MILL.

The Griffin Three Roller Ore Mill is a simply constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilian Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

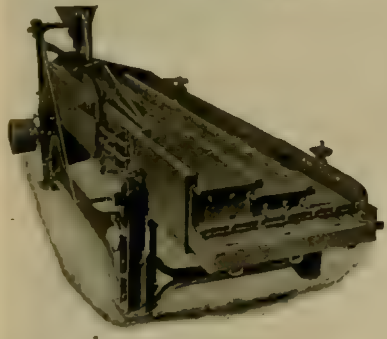
THE IMPROVED BARTLETT CONCENTRATING TABLE.



The BARTLETT CONCENTRATING TABLE has been GREATLY IMPROVED recently by the substitution of iron in place of wood wherever possible. It is now built with SOLID IRON TOP, PLANED TO A TRUE SURFACE AND POLISHED; all parts are made by template and EACH PART BEING INTERCHANGEABLE. As now constructed, the table has no special wearing parts and will last for many years. It has a CAPACITY OF FROM FIFTEEN TO FORTY-FIVE TONS IN TWENTY-FOUR HOURS, according to the class of ore worked. It is the only table in the world which will take the place of jigs and do away with all costly and complicated machinery.

It is Especially Designed for Separating Zinc from Lead.

Send for our illustrated catalogue, containing all the latest information on the concentration of ores.

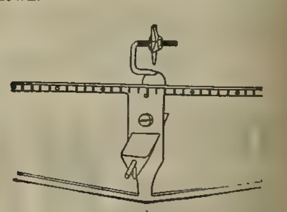
No. 1 Special Button Balance with 5-inch beam. Sensibility 1-200 Milligramme. Made for particularly accurate and rapid work and is guaranteed to be the finest balance on the market. It is the balance used by Prof. Forsythe of the Lawrence Scientific School, Harvard University, for scientific research. Send for Catalogue A, illustrating and describing a full line of assay and analytical balances, to

All of our latest improvements are embodied in this instrument and it is the result of our 18 years' experience in building balances.

Among the noteworthy features in the make-up of this balance is the improved adjusting device, herewith shown.



The adjusting device will appeal to the assayer as the simplest and most convenient means of checking the beam, and consists of a star wheel on a threaded arbor, mounted on the center edge back of the beam.

By turning this wheel backward or forward, it is moved along the arbor and so adjusts the beam to equilibrium.

Importers and Manufacturers of Assayers' Materials, Chemicals and Acids, Etc.
CATALOGUE ON APPLICATION.

IMPROVED BONE ASH.

It is 100% better than Bone Ash now being used; will absorb more lead, will never crack or split in the Muffle, can be dropped before or after using without breaking. Cupels can be made and used at once; no drying required. Excessive heat has no effect on them. Will stand shipping any distance. It takes up none of the precious metals in cupeling. Cupels much quicker. Once used always used. Sold under a positive guarantee or money refunded. Now being used by all smelters and assayers who have tried it.

Price of Improved Bone Ash, $60.00 per ton; $3.50 per 100 lbs.; or manufactured Cupels, $1.50 per hundred.

THE LITTLE ALASKA GOLD WASHER.

Price $6.
Saves the Gold.
Weighs only 7 1-2 Lbs.

After several years practical use in different fields, our washer has established its superiority over all placer or beach washers. It is just the washer for Cape Nome; it was used extensively in Alaska last year with every success. In working the operator does not have to wet his hands and can stand in an upright natural position. It is just the washer for the poor man who has not the money to put in expensive machinery. It will do the work of ten men with gold pans. It is just the washer for the prospector, being light and easy to pack. Don't fail to write us if in need of a washer; we can save you *time, labor* and *money.* RUSSELL & KINSEY, 1257 Magnolia Ave., Los Angeles, Cal.

PATENTS

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & Co.'s Patent Agency will have the benefit of a description in the *Mining and Scientific Press.* We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

ASSESSMENT NOTICES.

AMERICAN OIL AND REFINERY COMPANY.—Location of principal place of business, San Francisco, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 21st day of August, 1900, an assessment of ten (10) cents per share was levied upon all the subscribed capital stock of the said corporation, payable immediately to J. C. Anthony, secretary of said corporation, at its office, at room No. 323 of the Parrott building, Nos. 825 to 855 Market street, in the City and County of San Francisco, State of California.

Any stock upon which this assessment shall remain unpaid on the 26th day of September, 1900, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on MONDAY, the 29th day of October, 1900, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

J. C. ANTHONY, Secretary.

Office—Room 323 Parrott building, Nos. 825 to 855 Market street, San Francisco, California.

GOULD & CURRY SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 6th day of August, 1900, an assessment (No. 91) of fifteen (15) cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room No. 69, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 8th day of September, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 1st day of October, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

ALFRED K. DURBROW, Secretary.

Office—Room No. 69, Nevada block, No. 309 Montgomery street, San Francisco, California.

BEST & BELCHER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia District, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 3d day of August, 1900, an assessment (No. 71) of fifteen (15) cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room 33, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 7th day of September, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on FRIDAY, the 28th day of September, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

M. JAFFE, Secretary.

Office—Room 33, Nevada block, No. 309 Montgomery street, San Francisco, California.

ALLIANCE EXPLORATION & MINING COMPany.—Location of principal place of business, San Francisco, California; location of works, Ophir, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 3d day of August, 1900, an assessment (No. 3) of five (5) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 236 Sutter street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 11th day of September, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 2nd day of October, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

S. GOLDSMITH, Secretary.

Office—236 Sutter street, San Francisco, California.

EUREKA CONSOLIDATED DRIFT MINING COMPany.—Location of principal place of business, San Francisco, California; location of works, Forest Hill, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 9th day of August, 1900, an assessment (No. 26) of one (1) cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 214 Pine street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 8th day of September, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on SATURDAY, the 29th day of September, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

DELINQUENT SALE NOTICE.

COLUMBIA ATHLETIC CLUB (INC.)—Location of principal place of business, San Francisco, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 4) levied on the 27th day of June, 1900, and payable Saturday, June 30, 1900, the several amounts set opposite the names of the respective shareholders, as follows:

Name.	No. Cert.	No. Shares.	Amt.
Daniel F. Crowley........... ...		15	$50 00

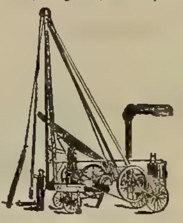
And in accordance with law, and an order from the Board of Directors, made on the 27th day of June, 1900, so many shares of each parcel of such stock as may be necessary, will be sold at public auction at the office of the club, 1200 Market street, San Francisco, California, on THURSDAY, the 30th day of August, 1900, at the hour of 12:30 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

JNO. H. EFFINGER, Secretary.

Office—1200 Market street, San Francisco, California.

A BORE HOLE

is the cheapest, quickest, most direct, and most effective way to test lands for minerals, oil, gas, salt, sulphur, borax, water, etc.



THE STAR DRILLING MACHINES

excel for these uses. They will drill a hole through anything to any depth from 250 to 2500 feet. The only machines made that are absolutely without annoying springs. They are simple, powerful and efficient. Easy to handle at work or on the road. Used in every State and Territory and in many foreign countries.

We also make full line of drill tool-bits, reamers, sand pumps, spuds, etc., etc. Write for illustrated free catalogue.

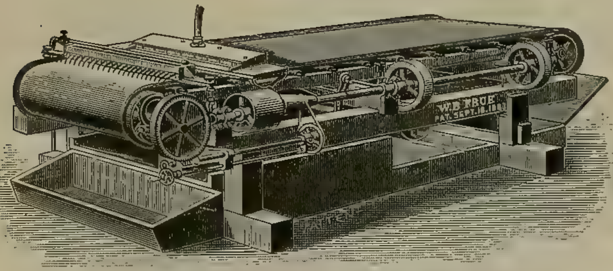
MACHINERY BARGAINS.

I have some splendid Air Compressors, Hoisting Engines, Rock Drills, Rock Crushers, Channeling Machines, Steam Pumps, Boilers, Steam Shovels, Locomotives and Relaying Rails, all in splendid condition. Send for printed list and specify your requirements. I can save you money. WILLIS SHAW, 627 New York Life Building, CHICAGO.

FOUR and SIX-FOOT FRUE VANNERS

With Brownell "Patent Lip" Flange Belts.



STANDARD MACHINE OF THE WORLD.

When a Concentrator like the Frue Vanner has been on the market nearly two decades, and the sales have constantly increased, it is safe to say it is the "Standard Machine of the World." More Frue Vanners have been sold during the last twelve months than for the same period at any time during the history of the machine. Practical mining men in all parts of the world where mining is carried on will testify as to its merits. It is the "standard" which all competitors are trying to imitate.

The results obtained by this machine are the "acme" of concentration, and several cheap and untried machines that have lately come on the market compare by it. The manufacturers will tell you that they are "just as good, and cheaper," etc. The facts are that no other concentrator made has an equal capacity, or will yield as clean a concentrate with as small loss in the tailings as the Frue Vanner. The amount saved from the lower first cost of an inferior machine counts little in the year's results, when compared with the increased output from a Frue. This machine not only gives better results at both ends of the belt (i. e., clean product and poor tailings), but is operated at less expense and requires less attention than any other machine on the market. At the Alaska-Treadwell mine, where they have ordered over 350 Frue Vanners, one man attends 48 machines for 12-hour shift.

FOR DESCRIPTIVE PAMPHLETS, ADDRESS

J. S. BROWNELL, Western Agent FRUE VANNING MACHINE CO.,
132 MARKET STREET, (Successor to Adams & Carter.) SAN FRANCISCO, CAL.

GEO. E. DOW PUMPING ENGINE CO.

(Successors to DOW STEAM PUMP WORKS.)

108-120 BEALE ST., - - SAN FRANCISCO, CAL.

MANUFACTURERS OF

DOW PUMPS

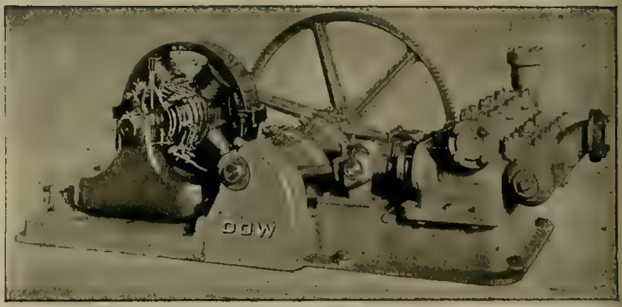
FOR MINING PURPOSES,

Operated by STEAM, AIR, ELECTRIC or WATER POWER.

VERTICAL SINKING PUMPS, BUCKET OR DOUBLE PLUNGER PATTERN.

DEEP MINE STATION PUMPS.

PUMPING MACHINERY FOR EVERY POSSIBLE DUTY.

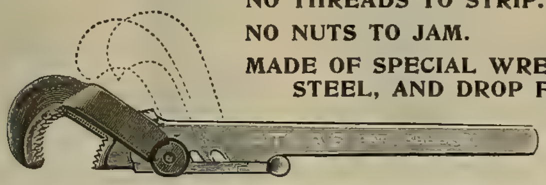


HOR. TRIPLEX MINE STATION PUMP WITH ELECTRIC MOTOR.

ATTENTION! USERS OF PIPE WRENCHES.

THE LATEST, BEST AND CHEAPEST PIPE WRENCH.

NO THREADS TO STRIP.
NO NUTS TO JAM.
MADE OF SPECIAL WRENCH STEEL, AND DROP FORGED.



The good qualities of Chain Pipe Wrench and Screw Pipe Wrench combined, without the faults of either.

Quick, effective and positive in adjustment. Cannot slip, crush or lock on the pipe.

Made in four sizes: 10, 18, 24 and 36 inches. Handling from ⅛ of an inch wire to 4½-inch pipe. Price no higher than other pipe wrenches on the market.

ATLAS PIPE WRENCH CO.,
Flood Building, SAN FRANCISCO.
NEW YORK OFFICE, 121 LIBERTY ST. WORKS, NEW HAVEN, CONN.

The Knowles Improved Steam Pumps.

Hoisting and Pumping Machinery.

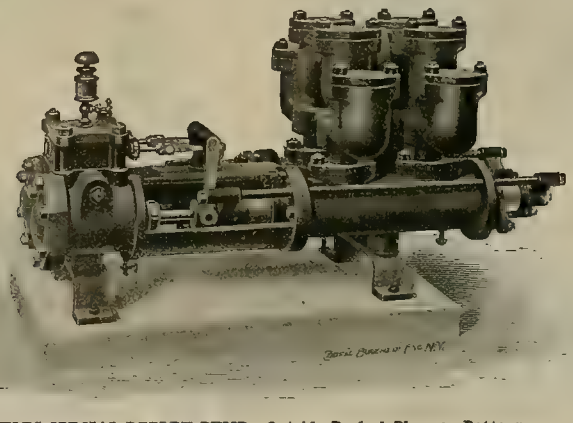
Mining Pumps,

Irrigation Pumps,

Artesian Well Engines,

Independent Air Pump and Condenser

For Stationary Engines or Steam Pumps.



KNOWLES SPECIAL DUPLEX PUMP. Outside Packed Plunger Pattern.

Power Pumping Machinery,

Speed Governors,

Balance Valves and Pressure Regulators

For Steam Pumps.

The Ingersoll-Sergeant Air Compressors and Rock Drills,
Bullock Diamond Drills.

PARKE & LACY CO., 21 & 23 FREMONT ST., SAN FRANCISCO, CAL.

DEWEY, STRONG & CO., Patent Agents, 330 Market St., S. F., Cal.

AT the Paris Exposition the United States wins pre-eminent recognition in mining and metallurgy.

THERE seems to be a hopeless difference of opinion between the Boston & Montana M. Co. and its receiver, Thos. Hinds. The latter asks for $400,000 for his services and $14,000 for an assistant. The company proffers Mr. H. $50 for a receipt in full, and is willing to pay the assistant $20. Incidentally the company also asks the attorney appointed by the receiver to take $200 for his bill for $15,000 and call it square. The value of the services of a mining engineer is also a subject of question, the company scaling the fee asked by Mr. Brown from $1000 to $25, and curtly claiming that the latter sum represents the full value of such services.

IN an account of the burning of the Weldon mine plant at Leadville, Colo., this week, is the usual statement that the engineer stuck to his post until all the men were hoisted from below: then he got out so badly burned that he is not expected to live. In battle, in the fullness of his pride and strength, the soldier bravely faces death, upheld by the contagious courage of his comrades. He is deified as a hero in song and story, and deservedly. No less heroic, rather more, is the brave man who, alone, amid falling timbers and roaring flames, stands at his station and saves the lives of his fellow workers in the mine who depend upon him for succor. All honor to the engineer of the Weldon mine and such dauntless souls as his, who deserve recognition for heroic devotion to duty!

THE mutual relation of a profitably producing mine and a profitably operated smelter is aptly illustrated by going into some figures produced by the News Bureau concerning the operations of the Centennial-Eureka mine, Tintic district, Utah, for the first six months of the year. During that time the mine produced $722,655. There were mined and shipped 20,000 tons ore, which yielded 1,148,455 pounds copper (2.87% to the ton); 14,628.081 ounces gold (0.731 ounce per ton); 384,638.27 ounces silver (19.23 ounces per ton). The smelter to which the ore was shipped deducted 1.3% of the copper contents, and made further deduction in calculating the price paid, making it net about 13 cents per pound. For the gold the smelter paid $19 per ounce; for the silver, 95% of the assay value. This, with the regular smelting charge—a total of about $13 per ton—would bring the smelting charges to about 40% of the value of the ore.

Profit in Mining Investment.

There is a present inequality of conditions that could be mutually improved. Money is so plenty, and rates of interest consequently so low, in the East that the United States is lending money to England, the late British loan being largely taken in New York. Call money is 1½%, and 3% securities are at a premium. In this west half of the same country are opportunities for profitable investment of this surplus idle wealth. The mineral industry of this region could be exploited to the common profit of all, the country built up and the millions begging for investment made to yield satisfactory returns. With better understanding of the facts this could be brought about. With idle millions seeking 2% investments and idle mines capable of producing 20% profit, the times seem propitious for "getting together." One obstacle to such mutual gain is the ill will and distrust that arise from ignorance of the facts. There is considerable ancient prejudice still existing east of the hundredth meridian regarding mining, which is still considered a game of chance instead of one of skill. Eastern people do not realize that in no other branch of industry has there been such advance as in the mining industry in the last ten years. Improved and economical mining and metallurgical mothods have made possible profit where formerly existing facts precluded successful working. It is to be said that in many cases sad experience has deterred further investment. But were that to count, nobody would do anything in any line of business. Lack of knowledge and absence of ordinary business judgment are fatal to success in any commercial pursuit, and mining is now made just as legitimate a form of business as anything else. Rightly managed, with due attention to business requirements, any business should prove reasonably profitable, the advantage in the mining business being that the customer seeks the producer; the demand is constantly commensurate with the supply; the destructive competition existing in other lines is notably absent, and many of the vexatious problems attendant upon other forms of commercial activity do not arise. There is plenty of capital awaiting profitable investment in the East for honest, legitimate mining, but none for boom deals or wildcat schemes. How to induce the profitable investment of that capital is a subject on which much has been said, some of it unwisely. The business of enlisting such capital is legitimate, honorable and necessary, and should be so conducted to secure success. There should be truthful statement, time given for investigation, prices made commensurate with value, and constant recognition of the fact that in these things honesty is not only the best but the only policy. Of course, there are always timid and distrustful souls who fear to pay $19 for a $20 gold piece, but, apart from these, there are plenty Eastern people who want profitable investment for their surplus money, and who have nerve and intelligence enough to buy what will yield such return if its worth can be satisfactorily shown to them.

When such statements as the above appear editorially in the MINING AND SCIENTIFIC PRESS, the usual result is a host of replies from Eastern readers, which, summed up, are about like this: "If in your 'west half of America' exist such valuable mining property as you say, why don't some of your wealthy residents take such good things themselves? Why should Eastern or foreign capital be sought?" implying that Western residents take the good things and want to unload the refuse on the unknowing alien. The answer in short meter is that the area and extent of such possible investment with profit exceed the financial ability of any limited class. Thousands of men resident in "the west half of America" have grown rich in mining, and invested their surplus in other mining projects; but were their number increased a thousand fold, and their investments correspondingly augmented, the area of probable profit-producing mining investments would not be materially curtailed in scope or extent.

THE increasing importance of the oil industry of California makes prominent the question of transportation. The one plan that at once suggests itself is the piping system, which has been carried to proficiency in the Eastern oil fields. In a limited way piping of oil has been done in California, but the fact that the conditions in California are different from the Eastern States does not warrant the idea that a great system of distribution and transportation of oil can be as readily produced here as in the Central States. There are different oil gravities in different districts, and in some instances the oil is of so low a gravity as to preclude successful prosecution of the plan. The question of getting the oil from the well to the consumer is of immediate commercial importance. Probably one of the first steps will be the adoption of a system of grading the oils and the gradual extension of the present pipe lines.

THE London Mining Journal of the 4th ult. has a page communication, a diatribe directed against American mining engineers, anonymous, and betraying a bitterness that precludes discussion of the facts. According to the anonymous correspondent of the London Mining Journal, American mining engineers are everything that they should not be, which is not a flattering comment on the business judgment of the British mine owners who have been all along eager to secure the services of American mining engineers in positions where skill, experience, ability and all the other elements that go to make up a successful mining engineer are required. The fact that the directors of many of the most reputable British mining companies made wise selection of American managers with great financial success, militates against notice of the charges of the anonymous British critic, whose hostility may come from the envy sometimes engendered in the breast of the unsuccessful. There are two kinds of people in the world—men who do things, and men who tell how things should or should not be done. The American mining engineer well represents the former class; the London critic as fittingly represents the other. Nothing is so cheap as a sneer, and sneering critics are usually found among the ranks of the unsuccessful. The American mining engineer needs no champion; he began to labor in the South African gold fields ten years ago, and out of the chaos of 1890 raised the industry to the prosperity it enjoyed just before the present war. The attack noticed is not the first of the kind, and those things need not be taken seriously. The American mining engineer made the Rand what it is; dominates the Rand to-day, and now having shown how the work should be done (it having become a manufacturing and mechanical proposition), probably less valuable men can continue on the lines indicated, for a time at least. Any answer to the attack referred to can best be left to those best competent to judge—namely, the directors and owners of the mines—the criterion being success.

THIS last year of the century is a great one for the prospector. He is out everywhere prospecting for gold and copper. Thousands of him have gone beyond the Arctic circle, past bleak Cape Nome, across to Siberia, through the hermit kingdom of Korea, along both shores of Bering sea and across British Columbia. Others have scattered with profit over a more attractive area in this west half of America that was ridden over years ago by horseback prospectors who announced that there was "nothing in it." More accurate attention to detail proves to their successors that there is a good deal in it. Like all connected with the mining industry prospectors are learning, a good deal of the old self-sufficiency has gone, and they are not above taking points from the experience and knowledge of others. The prospector of 1900 knows better than any of his predecessors the nature of gold, its peculiarities, where to look for it and how to get it when found. He no longer devotes all his time to quartz, but tests other formations known to be gold bearing. The prospector is the avant courier of the miner; he is as "the voice of one crying in the wilderness make straight the way of the Lord"; he rarely makes a good miner, and a good underground miner as rarely makes a good prospector; his mission and function is to scout ahead of the regular army, discover and explore, indicate where lies the treasure and leave to others the work of exploitation and development. With him lingers what is left of the picturesque in mining.

AT 16 cents per pound there is found a profit in importing copper coins from India and melting them for commercial use, being worth more that way than as coins.

Concentrates.

THERE is no premium on any U. S. gold mint coinage.

ANY U. S. mint will pay $18.60 per ounce, standard, or gold 900 fine.

LEACHING low grade copper ore was technically dis-ussed in the issue of Aug. 27, '98.

THE practical limit of height to which water may be fted by a syphon is about 27 feet.

REAL syenite contains but a very small percentage of uartz and rarely more than 50% silica.

ONE POUND lifted 1 foot in 1 minute is a "foot pound." Vhat is still called a "horse power" is 33,000 times that.

A FAIR average allowance for loss of mercury in a 10-tamp gold mill would be about fourteen pounds per nonth.

COLORADO gilsonite contains about 94% carbon, of vhich 40% is volatile. Utah gilsonite contains about 88% arbon.

THE Pacific system of the Southern Pacific Co. has a nileage of 5452 miles and operates 753 locomotives and 9,098 cars.

THE number of men employed in the mines of Butte, Montana, underground, is about 6000; 1200 are employed s surface men.

THERE may exist such a thing as a successful electric nelting furnace; but, if so, it is also successful in eludg public notice.

"THE deepest mine on the coast" (if eastern Nevada an be counted in) is the Union Con., Comstock lode, Virinia, Nev., 3350 feet.

GRAPHITE may be brazed by the dipping method, or liquid brazing," as it is called, with economy of operaon and efficient result.

A 500-ACRE RESERVOIR would require an inflow of war of 3.5 cubic feet per second to maintain loss by evapation, at a temperature of 60° F.

EXHAUST STEAM can not well be utilized to heat the linder of an engine, the temperature of exhaust steam ing lower than that of live steam.

EVERY application for a U. S. patent to mining ground ust show that $500 worth of work has been done on the aim, or for (not on) each claim if locations are ouped.

TELEPHONE service is of everyday use in many mines d effective. The primary cost is necessarily greater, the fittings need to be better than ordinarily supplied surface service.

REGARDLESS of its size, the annual required assessent work on an unpatented placer mining claim is $100. ork done on a ditch or canal to develop the claim could considered assessment work.

THE most recently added 520 stamps at the Alaska-readwell property each weigh 1050 pounds. The heavit stamps "Concentrates" ever heard of are at the Big anyon mine, El Dorado Co., Cal.—1400 pounds each.

A 4-INCH iron tube, .13 inch thick, tensile strength ,000 pounds, strength of weld 75% of solid plate, will quire 2437 pounds to burst it. For ordinary lengths in e in tubular boilers its collapsing pressure is 2080 unds.

IT is difficult to determine "how long woven wire reens ought to last in a stamp mill:" probably through e milling of 250 tons ore. Care in feeding and in seeing at they are kept clean and free will prolong their useness.

"ACHICAR" is a Mexican mining term meaning what S. miners call "unwatering." A "barra" means a are in a mine. Old Spanish law considered a mine vided into twenty-four parts, and each part was a barra."

A 900-LB. STAMP dropping 100 times a minute will reire 2 H. P.; that is, a 10-stamp mill would need at least a H. P. engine for the stamps: each stamp requires out 75 gallons of water per hour: each concentrator out 250 gallons.

THE Cape Nome boom for the transportation comnies having been worked for all it was worth, Bristol y and Golovin bay will probably be dangled as seducte bait. The fate of so many in Cape Nome should be fficient warning.

A CEMENT that will resist the action of water and is nsequently non-poisonous is made as follows: Four rts pure gelatine dissolved in fifty parts water; add % concentrated solution bicromate of potash; the mixre to be kept in the dark.

LARGE mining corporations find it commercially profite to employ a "geologist," just the same as a chemist metallurgist or consulting engineer. The Anaconda , at Butte, Montana, and the Calumet & Hecla, Michi-, are among such concerns.

CHROME ORE is found in various parts of California l has been mined with profit. It is used in the manuture of chrome salts and for linings of furnaces. Its ap importation precludes present possibility of profit marketing the domestic product.

THE objectionable smoke in flashlight photography be lessened by the use of ammonium nitrate. A xture of two parts magnesium and one of ammonium rate gives the same illumination as a mixture of one part of magnesium and three-fourths part of potassium permanganate. But equal parts of magnesium and ammonium nitrate show 2½ times the actinic power of a mixture in which three of magnesium and one of ammonium nitrate is used.

THE assay ton contains 29,166.6 grams. There are 29,166.6 ounces in one ton avoirdupois; if one assay ton of ore when assayed gives a resultant button of 10 milligrams, the assay value of the ore is ten ounces per ton. One ounce per ton is 0.00343%.

LIQUID CHLORINE is furnished by Mariner & Hoskins, 81 Clark St., Chicago, for chlorination plants. It is transported in strong steel cylinders, each containing about 115 pounds, equivalent to 610.6 cubic feet of the gas at ordinary pressure and temperature.

THE 50th anniversary of the discovery of gold in California was celebrated in San Francisco, in January, 1898, with great splendor. The celebration on the 9th, 10th and 11th inst., in San Francisco, will be the 50th anniversary of the admission of California into the Union.

IT is altogether practical to build a good-sized dam, even to the height of 100 feet, of material transported and deposited in place by flowing water, or "ground sluicing," but from start to finish the work should be controlled and superintended by a competent engineer.

PROBALY the highest in altitude of any smelter in the world is the smelting plant of the Backus & Johnson Co., Casapalca, Peru, on the Oroya Railway, in the Andes mountains, 13,606 feet above the sea, and about 100 miles inland. Nearly 500 men are employed, and the annual profit is said to be about $100,000.

THE trend of training for mining engineers is to make mining more mechanical and ore treatment more chemical, introducing order and system and occasioning more economical working methods. There is also a tendency toward a general interchange of opinion and a realization of the futility of attempts at secrecy in metallurgical processes.

A TOOL SHARPENER says for picks he has a box that holds about 200 pounds dry sand, which is always kept dry. After dressing the pick he allows it to cool about an inch, then sticks it down in the sand and leaves it there until it is nearly cold, and the sand will do its work. He asserts that picks thus treated are tough and will give satisfaction.

PART of the duty of the manager of a considerable mining property is to see that a complete and accurate system of mine cost accounts is kept, and nothing in its way is more conducive to economy and profit. Such cost sheets secure and make necessary close attention to detail and show where the little leaks are that in the aggregate so often drain off possible profit.

A PROMINENT mining engineer, in sending a communication of practical value, says: "This is a matter of reciprocity. I have received so much real information tersely given in 'Concentrates' that I feel impelled to make some return." A good many whose opinions are worthy of notice are pleased to say that they feel indebted to this page for much of value in their work.

ABOUT as near to a feasible plan of "co-operation" in actual mining work as most people usually get is where mine leasers pay a royalty on ores produced. There are other methods, feasible and commendatory, as where a prospector is grubstaked, or where promising property is developed, or where practical miners make a good mine by common effort (as in the case of the W. Y. O. D., Nevada Co., Cal.).

SOME up-to-date users of machinery now consider that the best way to use a tool is to work it for all it is worth; put as few repairs on it as possible, and drive it to death, the increased product justifying the rapid depreciation. They figure, too, that a tool or machine likely to become obsolete is not to be cared for or kept too long, but to be discarded for improved makes as soon as necessary, and that it is "cheaper" to throw out a machine and get a better one if the latter can produce more work, this as a matter of shop economy.

MOLYBDENUM in its chief ore, molybdenite, resembles in appearance "black lead" or graphite. The mineral contains 59% molybdenum and 41% sulphur; it is brittle, difficult to fuse, specific gravity 8.62, and is converted into molybdic acid by boiling with nitric acid; it is used in the determination of phosphoric acid, in the preparation of blue carmine for coloring porcelain, and as a substitute for tungsten in making hard, brittle steel. The market for it is very limited and uncertain and can be easily oversupplied.

IN preparing drills from hammered steel much depends upon the heating for temper. The drill should be sharpened to as acute an angle as will stand up to the rock to be worked. To avoid breakage, heat slowly to cherry red, getting an even heat on cut of bit, then with clean, soft water dip slowly, taking out drill in time to leave sufficient internal heat to start the temper and toughen the bit, leaving it a light straw color. There is a difference between a brittle-hard and a tough-hard. If you chill in water without starting the temper you get a brittle-hard.

IF a vein enters a side line and departs out of the same side line, the miner has no extralateral right whatever, but is confined solely to his intralimital right of mining within his lines entirely. If a miner locates along the course of his ledge 1500 feet, he can have only one dip right; he may discover a ledge that runs across his location, but he can not follow it on its dip beyond his end lines. But if he mistakes the course of his vein in making his location, his end lines will become his side lines, and then he will have the right to follow the ledge on its dip beyond his new side lines, which were originally his end lines.

SIMPLE fire extinguishers can be made for use around a mill or mining plant: twenty pounds common salt, ten pounds sal ammoniac (nitrate of ammonia), are to be dissolved in seven gallons water. Put the solution into thin glass quart bottles, cork tightly and seal to prevent evaporation; set around where they will be handy, yet not in the way. In case of fire, throw so as to break in or near the flame. If the fire be in cotton or other soft stuff that will not admit of the bottle breaking, knock off the neck and scatter the contents. The breaking of the bottle will liberate a certain amount of gas, and the heat of the fire will generate more that will choke and stifle the flame.

CONCERNING the "purple of Cassius" test for gold, previously mentioned, an expert in metallurgy writes: "With regard to the chloride of tin test for gold, it is utterly unreliable and uncertain in the presence of cyanide of potassium. The solution must first be evaporated to dryness with a little aqua regia to destroy the cyanide before the test is applied, and then on diluting the residue with a little water the test may be applied. But it is much better to evaporate a 100 cc. in a lead tray and cupel the residue and determine the gold quantitatively, or else evaporate 10 A. T. with litharge and run it through the crucible assay and cupel the button. It is very much more satisfactory and not much more trouble."

OSMIUM is the heaviest and most infusible of the metals. Osmiridium is a natural alloy of osmium and iridium. This metal, or alloy, has been found in various placer mines in California, particularly in the northern part. Owing to its high specific gravity, in washing sand and gravel it concentrates with the gold. It can be easily distinguished by its bright metallic color and flat, scaly appearance, is insoluble in acid, and can not be melted by ordinary furnace heat. The shape of grain is irregular, has a ragged edge, and varies in size from that of fine to coarse sand, and often larger. As the market for osmiridium has been limited, little attention has been paid to it on this coast, but it is believed considerable quantities may be found if miners will turn their attention in that direction. Should anyone find any of this metal, the Selby Smelting & Lead Works, 416 Montgomery St., San Francisco, will be pleased to quote rates on receipt of sample.

THE appearance of a halftone engraving in the issue of Aug. 18, from a photograph taken by moonlight, has elicited several letters, some saying they did not believe that a photograph could be taken by moonlight, others citing similar instances of successful moonlight photography, and others asserting that there exists a process of photography without light, though there is no justification for the use of such a contradiction in terms, as any one successful in securing pictures "in the dark" has simply succeeded in demonstrating that light exists in places and substance where it has not hitherto been recognized. If uranium is placed on a photographic plate in what appears to be perfect darkness, and allowed to remain for some days, the plate is acted upon as in ordinary photography. Mercury, magnesium, nickel, pewter and ten other metals give off rays capable of reproducing an image on the substance on a photographic plate without the assistance of a light in the ordinary sense of the word. A polished piece of zinc, if laid on a highly sensitive plate in a dark cupboard, will, even in four or five hours, produce a complete picture of the zinc, showing the scratches or any ruled lines or pattern drawn on it.

IN the case of the Marburg lode mining claim at Pueblo, Colo., the Secretary of the Interior has this week made a decision of importance to miners everywhere. He says: "When the right to a patent to a mining claim has been fully acquired the equitable title in the purchaser is complete and there is no obligation on his part to make further expenditure in labor or improvements on the claims under Section 2324, Revised Statutes, and no interests can therefore be acquired by relocation or otherwise against him. The annual expenditure of $100 in labor or improvements on a mining claim, required by Section 2324, Revised Statutes, is solely a matter between rival or adverse claimants to the same mineral land and only goes to the right of possession, the determination of which is committed exclusively to the courts. It is a matter with which the Land Department has nothing to do and hence can make no determination with respect to it; and the failure of an applicant for patent to a mining claim to prosecute his application to completion by filing the necessary proofs and making payment for the land within a reasonable time after the expiration of the period of publication of notice of the application, or after the termination of adverse proceedings in the courts, constitutes a waiver by the applicant of all rights obtained by the earlier proceedings upon the application. Where an adverse claim is filed during the period of publication it shall be upon oath of the person making the same, and shall show the nature, boundaries and extent of such adverse claim and all proceedings except the publication of notice, and making and filing the affidavit thereof shall be stayed until the controversy shall have been settled or decided by a court of competent jurisdiction or the adverse claim waived."

Charcoal Precipitation from Cyanide Solutions.

TO THE EDITOR:—Has anything of technical value recently been published concerning the use of charcoal in gold precipitation from cyanide solution? You used to publish a good deal on this subject.
Los Angeles, Cal., Aug. 25.

Several questions similar in character to the above have been lately received. Much on the subject has appeared herein. Probably the latest most extended discussion of the subject is contained in a paper read by Jno. I. Lowles before the Institute of Mining and Metallurgy. In that monograph "On Charcoal Precipitation from Auro-Cyanide Solutions," Mr. Lowles says on the subject of the precipitation of gold from cyanide solutions by means of charcoal, that outside of Victoria it is but seldom employed, but there it is used to the almost total exclusion of any other method. The number of cyanide plants, small and large, throughout the colony is very great, owing to the numerous heaps of tailings on living mines and on abandoned properties, accumulated during the forty odd years of the existence of the quartz mining industry in Victoria. In the greater number of these installations the charcoal method is employed, in many cases probably in imitation, rather than with any definite grounds for its superiority over the zinc process.

The methods are, of course, identical down to the extractor house, which in a large plant there, a typical case, contains 198 tubs, each 2 feet 4 inches high, 2 feet 1 inch in diameter at the top and 1 foot 9 inches at the bottom. In the center of the bottom of each tub are two small wooden cleats, 4 inches apart, on which rests a glazed drain pipe, 4 inches diameter, flanged end downwards. The center pipes and tubs are filled with charcoal, coarse for 6 inches from the bottom and medium size to within 6 inches of the top of the center pipe, with about 3 inches outside and 5 inches inside the tub of coarse charcoal again. On the top of the charcoal, in the tub itself, i. e., all round the pipe, is a wooden lid to keep the charcoal from floating and blocking up the outlet pipe.

Another form of filter tub much used has no center pipe, but there is a false bottom covered with a filter cloth, above which is charcoal, and on top a hinged lid, kept locked, with the feed pipe led into it. The solution leaves the tub under the false bottom by means of a siphon pipe to the next tub.

The preparation of the charcoal is important. Impurities are prejudicial and wasteful. Fine stuff is objectionable, as it will pass through the sumps with the solutions (and, incidentally, decompose the KCy), besides making a bad filtering medium when closely packed. Heavy, compact charcoal, again, is not nearly so efficient as that which is soft and porous. Gold is deposited throughout the whole of light charcoal, so that compact material offers far less surface. Moreover, it would take longer to incinerate. Accordingly the charcoal is ground and sieved to three sizes: coarse (about ½-inch), medium and fine, which last is straightway rejected. The other sizes are thrown into separate tanks of water and washed; the compact coal sinks, the light, porous stuff of both sizes is skimmed off and allowed to dry before being used. About 30% of the original quantity of charcoal is lost by this treatment.

The tubs in these works are arranged in two groups, the first of 144 filters, in twenty-four sets of six each for strong solution, and the second of fifty-four filters, in eighteen sets of three each for alkaline wash (containing 0.04% KCy) and weak solution.

The solution passing through a 1-inch branch from a 3-inch main travels down the center pipe of the top filter in each set, coming up on the outside over the lid, and through another 1-inch pipe to the second filter, and so on, finally passing away by an iron-lined launder (a tile lining would be better) to its own particular sump, whether alkaline, strong or weak. The top of each of the last five filters of a set is placed 3 inches lower than the top of the preceding one. The top filter naturally catches most gold, and when fairly charged is removed, and each of the remaining five tubs of the set is moved up one step, bringing second filter into first place, a tub with fresh charcoal being put into sixth position. The filter removed is relieved of some of its solution (to save loss during moving), and emptied into a large box with a filter bottom, when what solution there is in the tub drains away to the strong solution sump, leaving the auriferous charcoal ready to be shovelled out and taken to the furnace room. Every day eight top-strong solution filters are emptied in this way, so that a tub occupies first position during three days. The flow of solution from the intermediary tanks to the filters is regulated by valves in the main, and an ingenious arrangement prevents that flow being exceeded. At the junctions of the mains with the distributing pipe a small open glass tube is inserted, in which the solution under the right pressure rises to a certain height. A very slight excess over the proper pressure will cause this tube to overflow, obliging the attendant to pay strict attention to the amount of solution he allows to pass through.

The absence of iron in the filter tubs constitutes a slight advantage over zinc boxes, where the iron sieves at any rate do not improve the solutions.

The launders from the filters are connected with all the sumps, so that, if necessary, any one solution can be passed over the whole of the filters, but as a rule the filters are worked in two groups, as shown above, and then about 400 gallons of strong solution per hour pass through 144 tubs, and 300 gallons of weak or alkaline through 54 tubs.

The efficiency of the precipitation of the gold by the charcoal is of course an important point. Zinc does not seem to act rapidly enough, or, indeed, quite effectually, on very dilute solutions, whence arose the usefulness of the Siemens-Halske and other electrolytic processes, but with charcoal the strength of solution does not seem to affect the percentage of precipitation at all, which remains uniformly high. At one large works the solutions going out into the launders from the tubs rarely show more that 3½ grains gold per ton. Solutions down to 0.04% KCy are successfully precipitated at this establishment.

The gold caught by the top filter of a set is considerably purer than that caught in the lower ones. Frequent tests show this to be quite characteristic, steady diminution in the value of the gold taking place downwards through a set, till in the bottom tub it is nearly pure silver. However, as the filters are shifted from the bottom upwards, they all contain about the same quality gold when burnt.

The reason for this peculiarity is, no doubt, owing to the gold being precipitated first and other metals afterwards.

No doubt experiments might be usefully made as to the desirability and economy of keeping the contents of the top filter separate from the rest, as containing very pure bullion, requiring little or no refining. With six filters in each strong solution set, the two top filters might be allowed to remain stationary until well charged, the "step-up" process being confined to the lower four.

The exact action of the charcoal has, so far as the writer knows, never been experimentally demonstrated. Rose, discussing the question in connection with its use in the chlorination process, states that the prevailing opinion is that the hydrogen and hydrocarbons remaining in the charcoal are the active agents in the precipitation. No doubt this would apply also in precipitation from cyanide solutions, the result being the formation of hydrocyanic acid and free gold. This HCn itself represents a certain amount of loss of an active agent.

It is an accepted fact that the prolonged contact of cyanide solutions with charcoal causes a loss of cyanogen. This undesirable condition obviously obtains, as the same solution (of course strengthened as and when required) circulates for months between the leaching vats and the filters.

Park instances the case of the Kapai-Vermont Works, New Zealand, where the ore was kiln-dried before being sent to the pulverizers. Here it paid to employ labor to pick out the lumps of charcoal and partially carbonized wood rather than sustain the loss of cyanide (and gold, also, in the leaching vats), which neglect of this precaution involved.

In the daily trials of the solutions the loss from this cause would not seem to be great. In one case where a 0.25% strong solution is used, it titrates 0.11% after use, and the major part of the 0.14% difference must be accounted for by the gold dissolved.

From the filter house the auriferous charcoal is conveyed to the furnace room. At the same works, whose extractor plant has been described, there are four reverberatory furnaces, each 10 feet long. The charcoal is charged in through side doors, of which there are six to each furnace, each perforated with a number of holes to admit air to assist in burning off the carbon. The furnaces are arranged in pairs, with a stack to each pair. When charged, a wood fire is lighted in the firebox until the charcoal is well alight, when the dampers are closed and it is allowed to slowly burn itself out. This it does not do completely, so it is sieved in a trommel of 900-mesh, contained in an iron box, what remains in the trommel being returned to the furnace with the next charge. The fine stuff in the box is called "ash." Every twelve pounds of ash carries from nine to ten ounces of gold. This ash is mixed with borax (in the proportion of three parts borax to one and a half ash, with one of dried and washed tailings, when the ash is alkaline), and smelted in graphite crucibles. The pots are filled and placed in the furnace, the slag skimmed from time to time, and fresh charges of "ash" added, till sufficient gold has accumulated in one pot, or the latter shows signs of wear, when it is poured into a mould. It is certain that some appreciable loss must take place during this operation, owing to the numerous small quantities of valuable ash which are dealt with. Some of the stuff is almost impalpable dust. When charging redhot crucibles, it is apparent that many fine articles are carried away by the expansion of air in the neighborhood of the crucible.

In spite of some very strong points in its favor, it is doubtful if these are sufficient to cause the charcoal method to supersede the better-known zinc process. The writer thinks that the following advantages deserve careful consideration: (1) A high-class bullion is produced. One well-known mine there receives $19.45 per ounce for its cyanide gold. At any rate the bullion does not have a detrimental constituent, such as zinc, introduced into it by the necessities of the method used, and is of a nature easily refinable. (2) The percentage of the precipitation extraction is high; and this is, so far as the writer knows, regardless of the strength of the solution. (3) In spite of the large quantity of auriferous charcoal to be dealt with, a great part of the waste in it is so easily got rid of (by simply letting it burn itself out), and the resultant "ash" is so directly and easily smeltable, that this disadvantage is almost, if not quite, counterbalanced. There is no necessity, as with zinc slimes, for careful oxidizing roasts (with some unavoidable loss), or treatment with strong acids.

The one great disadvantage of the method seems to be the greater chance of loss through the immense bulk of stuff handled, and higher cost of the operation itself. Minor points are a somewhat greater outlay for plant and buildings. The effects of the decomposition of the solutions by the charcoal have not yet been very well defined.

At one of the large Australian works, 700 ounces of gold are deposited per month on 10,000 pounds weight of charcoal. W. M. Davis, in the chlorination process, found that 240 parts of charcoal were required for the precipitation of 19¼ parts of gold. It will be seen that the proportion is about the same as with cyanide solutions.

Theoretically, one ounce of zinc should precipitate six ounces of gold, but in practice from four to twelve ounces of zinc are required for every ounce of gold. Allowing eight ounces Zn for one ounce Au, 350 pounds Zn would be required to precipitate 700 ounces of gold. The cost of charcoal precipitation works out (with charcoal sold at 9d for forty pounds) at 4.29d per ounce of gold, or, at these works, 0.545d per ton of stuff treated. Zinc precipitation (with Zn at 4½d per pound) would cost 2.25d per ounce of gold, or 0.275d per ton of stuff. The labor necessary must also be considered. In these works two men at 7s each per diem are kept constantly employed in the extractor house. This works out at 0.760d per ton of stuff treated. With zinc extractors the work could be done by the foreman, or even allowing one man at 7s the cost would be reduced by half, that is, to 0.382 per ton.

To recover the gold from the charcoal "ash" costs at these works 1s per ounce of bullion 900 fine, exclusive of labor. This is accounted for by the large quantity of stuff to be smelted, with a consequent large expense for fluxes, fuel and pots. In some works in New Zealand and South Africa, the cost of the recovery of the gold from zinc slimes is as low as 2d per ounce, though probably it would not average more than 800 fine.

This particular item does not of course make much difference when spread over a number of tons of low-grade ore, for the total cost at this particular plant, with cyanide at 1s 2d per pound, is only 2s 3d per ton.

Considering these works particularly with reference to loss through the large bulk of stuff frequently handled, we see 10,000 pounds of charcoal transferred from 208 filters (i. e., eight filters per day twenty-six days a month) to the draining box, divided among four furnaces for incinerating, and finally smelted in charges of not less than twelve to fifteen pounds.

There remain the questions of increased outlay for plant and buildings, but these are not very serious.

Still considering the same works, each filter tub costs 25s complete, so that the whole 198 cost £247 10s. Zinc extractors of the necessary capacity, with trays, steel side launders, etc., cost £60.

Some expense on this head might be saved by the substitution of large shallow wooden tanks, such as are in use at the Mount Morgan chlorination works, though perhaps the thorough contact between the solution and the charcoal which is most favorable to successful precipitation would not take place in them as well as in the numerous small tubs.

The area of the building occupied by the filters and connections is fully 1000 square feet. Zinc boxes would require but a small portion of this.

Colorado Smelting Methods.*

Written by JAS. L. HODGES.

The Omaha & Grant Smelting Works at Durango, Colo., draws its supply of ore from all parts of the southern counties. At no other point in Colorado is the metallurgical problem quite so complicated as at this smelter. Large percentages of zinc, arsenic, copper and antimony are continuously present, and a very large proportion of the ore supply is received at the smelter in the form of concentrates, which have to be specially handled. The principal advances in smelter work have been in the line of mechanical improvements. Any device which shortens time in the preparation of the ore for the furnaces or lessens labor at some point at once becomes a factor in the economical treatment of the ore. A number of such factors have been introduced, some very interesting.

Beginning at the roasting furnaces: As fast as possible the fireboxes are being altered from the old method of direct coal burning furnaces to gas producers. The air is forced under the grates by a moderate pressure from a steam jet at each end of the firebox, the steam acting as an injector. A much poorer grade of coal can be used by this method of combustion. Instead of "slag roasting" the ores in these furnaces, the finish is given as a sinter roast, requiring much less heat than in slagging the ore, and becomes an important saving in fuel as well as of abor in crushing the slagged ore. At the slag tap of the furnace another improvement has been introduced, made possible here because of the topography of the ground on which the smelter is built. At the oot of the slag dump flows the Animas river, water from which is forced by powerful pumps to a point just below the level of the working floor of the urnace. As the slag runs out from a large separatng box, instead of into a slag pot, to be hauled away, t is allowed to fall through a hole in the iron floor nto a launder, at the end of which is a pipe conveyng a stream of water, under pressure from the pump above mentioned, which hits the stream of molten lag almost at right angles, and instantaneously slivers the slag into a granulated condition. The same tream which granulates the slag carries it by its orce down the launder and deposits it in the Animas iver, to be carried away. Experiments have shown hat this granulated slag, owing to its extremely harp edges, makes an admirable sand for mortar. The separating box referred to is very ingeniously arranged, so that it can be drawn away from the urnace by a cable attached to a hoisting engine, and when on the dump can be knocked down, the sides eing movable, leaving the mass of cooled slag at a onvenient point for further use, if needed.

---

*Treasury Report.

Other improvements have been introduced in sampling the ores, the main feature of which is that the large sample of ore, previous to being finally cut own, is deposited automatically in an iron hopper which travels on a crane to the dividing table and is here divided automatically. The portion saved for urther quartering is then in the same rapid manner ivided again upon small dividers. The whole work very rapid and accurate, and one man in the sampling room does the work of several men required ormerly.

owell & Arizona C. M. & S. Co.'s Plant, Bisbee, Arizona.

To the Editor:—I send you herewith two photoraphs of the Lowell & Arizona C. M. & S. Co.'s ant here, one a general view, the other a larger

Head Gear at the Lowell & Arizona Copper M. & S. Co.'s Mine, Bisbee, Arizona.

ew of the head gear or gallows-frame. You will te that it differs considerably from California and ontana make of head frames, and inclines more osely to the Colorado style. It was designed and ected by Arthur Neustaedter of St. Louis. The owell & Arizona C. M. & S. Co. is now shipping ore d have things working in good shape, with a force about sixty men. Their engine was built by the nion Iron Works of San Francisco and at the pres- t is the largest hoist running in the camp. They e using the Montana code of bell signals in their ne and they give entire satisfaction. The company s a day and night station tender, and no one is owed to touch the bell rope but the station tender. is insures economical work in addition to perfect ety. The company is sinking a shaft, now down 0 feet, and will go 900 before they stop, with the pes of finding water. If they find no water in the ne in sufficient quantities they will build their elting plant down on the San Pedro river, about miles from here. They will have a down-hill haul the railroad and can arrange for good rates, as railroad company hauls from twenty to thirty pty cars out of here every day.

There is great activity in northern Sonora, Mex, and several places are starting up.

The South Bisbee people here are now working two fts, and have some good ore. They have shipped a few cars and, I think, are arranging to ship on a much larger scale in the near future.

We have all been very short of water in Bisbee this season, and old-timers say that we never were without rain for such a long time. We have to condense water, and you will note in the picture I send, a long pipe running up the hill. This is the pipe which condenses the steam, and the exhaust from the engine runs into it. The engine has 14x16-inch cylinders, and they use when running steady only about 500 gallons of water per day. By condensing the steam they get a superior quality of water.

The Copper Queen people are adding another smelter to their already large plant. The new first-motion hoist for the Copper Queen—Spray shaft—will be here in about a month. Their gallows-frame and shaft house are of steel, and I understand that they are to use double-deck cages. This camp is prosperous and we expect to have a second Butte here.

Bisbee, Aug. 20.

Silver Smelting in Mexico.*

NUMBER VI.

In the case of excessive iron reduction, zincy matte segregates from iron matte, and, owing to its spongy condition and low specific gravity, floats on top of the slag, carrying sulphide of silver along, which accounts for the silver value of the slag. It is known that metallic iron decomposes sulphide of zinc and also sulphide of copper to some extent, but these reactions are never absolute, which explains the existence of zinc in the matte and of copper in the lead bullion. Cuprous sulphide, however, has the property to fuse together with zinc sulphide, and thus carry it into the matte, thereby cleansing the slag. This fact is made use of in cases where the lead percentage of the charge is insufficient to cover the silver. Sulphide of lead does not combine with zinc sulphide; it is, therefore, useless to increase the specific gravity of the matte, on that account, by driving lead into it.

Most smelters carry now enough copper on their charge to produce a first matte of from 8% to 12% of copper. To go beyond that is inexpedient, on account of the difficulty of keeping the syphon tap open. This difficulty renders the constant use of sledge and bar necessary—an operation which wears out and scares off the workmen.

The copious production of speiss is another sign of excessive reduction, hence unnecessary consumption of fuel. By continued cutting down of the fuel, a point will be reached when the production of speiss will cease altogether, and the matte will run up in lead. The bullion will deteriorate by taking up that arsenic which is not volatilized as arsenious anhydride or arsenious trisulphide. At the same time a copper speiss may be formed, which will incrustate the hearth and clog the syphon tap. The slag will also run up in lead, if not in silver. It is a matter of good judgment then to know how far it is prudent to go. I do not think it will pay to run the matte higher up in lead than 18%. A higher grade matte is also difficult to roast well. In order not to miss the proper point, it is necessary to take frequent samples of the matte—at any rate one a day from each furnace—assay them and regulate the fuel.

The cutting down of the fuel necessitates the raising of the blast, but this must not be exaggerated, otherwise the heat will rise to the top, the hearth will soon be chilled, and the furnace run slower.

If speiss be produced, it may be added to the ore charge again, when most of the arsenic will go off as sulphide by entering into union with the sulphur of the sulphides present. In the concentration of matte there is always some copper speiss obtained, which has probably been in mechanical admixture with the matte. Though copper speiss, if in large lumps, is hard to break, even by a drop weight, still, if resmelted in conjunction with sulphides, a foliated speiss with a reduced percentage of copper will result, which can be passed through rolls, if it is desired to roast it, in conjunction with sulphides, or broken with a hammer for addition to the charge.

Coke containing much gaseous matter will also resist reduction, even if added in excess. In this case the use of mixed fuel, i. e., charcoal and coke, is advisable. Fluorspar, which is not often found associated with Mexican ores, acts like cuprous sulphide on zincy matte, only in a different way. It renders the slag so hot and liquid that the zincy matte remains with the iron matte, and does not segregate as in the case of a slag of a lower temperature. One mine which produced ores with fluorspar gangue in notable quantities was the Veta Grande, near Parral, Chihuahua. Such ore permits a considerable reduction in fuel, and is also beneficial in the treatment of ores carrying barite. The separation of matte, speiss and slag, which are tapped intermittently from the furnace, is effected in a cast iron matte or overflow pot, and more frequently called settler, which is mounted on a carriage and placed under the flag spout. It is of conical shape, hemispherical towards the bottom, and measures 36 inches diameter at top by 22 inches in depth. It weighs over 600 pounds and holds about 580 pounds of matte and slag.

Matte, speiss and lead, if any, will sink to the bottom of the pot and separate there in strata, in the order of their specific gravities; while the slag, with the exception of the chilled crust serving as a cover for the matte, will overflow through a spot attached to the settler into a smaller pot—the slag pot—made of cast steel and also mounted on a carriage. When filled, this pot is removed, replaced by an empty one and allowed to cool down for a few minutes until top of slag is black. It is then taken to a dumping pit, where a workman, called the "picador," punches two holes in the top crust—one in front and one in the back—when it is emptied by the pot puller into large pots underneath, the slag running out from the front hole, while the gases escape through the other. The shells are saved for resmelting. This method is imperfect, but the use of the Devereux pot of the small dimensions, as they are locally made imperative, caused too much loss of time and had to be abandoned. The dumping pits are located between two slag hills, which were built up in an evil hour in front of and in too close proximity to the furnace shed. It is 3 feet 4½ inches deep, 6 feet 4 inches wide and 12 feet long, and is covered over with heavy cast iron plates, in the lengthwise center line of which a slot is left wide enough to pour slag from both sides into the pots underneath. There is room for four pots, so that eight slag pots may be emptied simultaneously into them. Each of these large pots—twin pots or double dumping pots, so called—is resting in a rotatable frame attached to a railway truck, a device which is patented by the Colorado Iron Works, Denver, and known as the Nesmith truck.

General View Lowell & Arizona Copper M. &. S. Co.'s Mine, Bisbee, Arizona,

A railway track of 36-inch gauge extends from the pit on an ascending grade to the edge of the slag dump, so that the pots when filled may be hauled by a 7x12-inch locomotive and emptied. The shells from these pots are not saved. As soon as the locomotive has taken out a load, another set of trucks is let down into the pit by gravity and is being filled.

A locomotive, two of which are used alternately, consumes twenty-one tons of anthracite coal a month, and requires one driver, one switchman, one pot washer and one dumper per twelve-hour shift, whose wages amount to $8.75, or $17.50 in twenty-four hours.

The dumping pit gives considerable trouble in the rainy season, when it is frequently submerged.

The slag samples are taken twice a day from each furnace and granulated. The slag of each furnace is assayed separately, but an analysis is made only once a day of a mixture of the granulations of all the furnaces running on the same charge, except in special cases.

The shells from the slag pots are dumped into a buggy standing in a pit and hoisted by an electric elevator to the top of the slag hill, whence they are taken over a bridge to the charge floor. The settlers are also hoisted by another elevator to the top of the same slag hill, and emptied when cold. The matte cones of each furnace and each shift are kept together in one place and marked with the number of the furnace, so as to have a check on the work of the men. When cold, the slag is separated from matte and speiss, broken up and wheeled across a bridge to the furnaces. The matte is broken up and speiss is picked off, as much as possible, weighed, and put on the heap of the respective month. This is done to get an idea of the daily production of matte and speiss. The matte is wetted every day by turning on a stream of water from a hose. By this arrangement the matte weathers, crumbles up and can then be easily separated from the speiss. At convenient intervals, it is trammed over a bridge connecting the slag hill with the charge floor to another bridge connecting the charge floor with the sample mill, and run through a ball pulverizer. The ground material is weighed and sampled before it goes to the calciners.

---

*Describing the Guggenheim Smelter at Monterey.

The speiss is either returned to the furnaces, or, if not convenient, held in reserve. An analysis of 1482 tons of speiss showed as follows: Fe 71.6, As 15.6, S 5.5, Cu 1.2, Pb 3.5, not determined 2.6; total, 100. Silver contents, 14.3 ounces per 2000-pound ton; gold contents, 0.08 ounces per 2000-pound ton.

This speiss shows excessive reduction of iron; it should not have contained more than 60% of iron. It is apt to cause incrustations in the hearth, and, while liquid, it is intensely hot, imparting its heat to the settler, which appears white-hot at the bottom. It always carries lead-bullion along mechanically, and adheres tenaciously to the cast iron pot, so that frequently it had to be chiseled out, an operation which is attended by great breakage of pots and loss of time. The metallic lead also contributes to the "sticking of the pots" when solidified. If lead should go into the settler in quantity, as is the case when a furnace is not working well, it becomes necessary to pour it off into smaller pots as soon as matte and speiss have hardened sufficiently to permit this procedure. At smelter No. 2 they use a tap-hole near the bottom of the settler, at its back, with a spout attached to it, to tap off matte, speiss and lead into a flat, troughlike vessel on wheels standing in a pit. This arrangement has not given satisfaction at smelter No. 3, on account of the rapid widening out of the tap-hole by corrosion, and the frequent breaking off of the spout during the removal of the settler to the top of the slag hill. In the measure in which the matte approaches the stage of copper matte, it acts like the above speiss; the settler pots become "sticky," and require much hammering to get the matte cones detached. They also require cooling with water. The settlers were changed ordinarily every 1½ hours; but when the matte fall increased beyond the 5% mark (5% of the weight of the ore), they had to be changed oftener, and then the settler men used to desert their work. In smelting much Angangueo coarse ore, which was imperfectly roasted, the flow of slag was so rapid that the separation of matte was incomplete, and a good deal would run over into the slag pot. In order to save this matte, it then became necessary to save all the slag and break it off when cold, thus entailing a lot of work, which required extra men.

The application of a firebrick-lined settler of rectangular form, like the one in use at copper furnaces, known under the name of Orford forehearth, would recommend itself for such emergencies. But local conditions forbid it. The hearths of the furnaces were not high enough to get such a settler under the spout, without resorting to subterranean work; besides, the working of the furnaces was not rapid enough to keep the matte from chilling in the forehearth. So the manipulation of the slag had to be managed according to the circumstances.

The amount of slag resulting from 1000 pounds of charge is about 60%, to which have been added 400 pounds of slag from the preceding smelting. Of the 750 tons of slag produced, 300 are smelted over again when ten furnaces are running.

The method of separating matte and slag in vogue at the Omaha & Grant Works, Denver, Colo., who were in the same position as Smelter No. 3, might have been adopted at the latter place; but, the works being old and subject to continual repair, the firm decided to rebuild them entirely.

The lead bullion from the ore furnaces is allowed to run over continuously from the lead well into a small cast iron pot—the cooler—which holds eight 96-pound bars. This pot rests in a cast iron frame—the stove—over a fireplace, so that it may be heated when the bullion gets too cold to ladle it into molds. As the bullion is impure, it chills very quickly; but, owing to the want of draught, the ladlers do not use the stove. They prefer to pour hot slag on the bullion, to thaw it out, and afterwards to skim off the slag. The proper way would be to tap the bullion at stated intervals, as is done at some smelters in Colorado, into the cooler, skim off the dross and mold the bullion in one continuous series of operations. But it is next to impossible to break the natives from a routine once acquired.

The lead well is built up two thicknesses of brick above the curb plates, to keep the lead as high as possible in the crucible; but if the furnace is run on a reduced pressure of blast the height of the lead well must be reduced, too, or the bullion will run out of the slag tap.

At the matte furnace the bullion is tapped in the old fashion, direct from the crucible into a cast iron basin, at a point 8 inches from the top of the curb plates. If tapped from the lowest point of the crucible the tap frequently becomes so hot and soft that sudden outbreaks will occur. On this account it is advisable to tap the matte bullion through a tap jacket, like slag.

The furnace bullion is, as already stated, remelted in an annex of the furnace building. If the sole object of this operation were to obtain a dip sample of the bullion instead of a punch sample, no exception could be taken to it; but, as the main object is the recovery of the copper from the bullion, the sweating process in a liquation furnace as it is carried out at smelter No. 2, and at many refineries, is much more preferable. Copper will separate from lead bullion at a low temperature. If the copper dross is then skimmed off, a great deal of lead will go mechanically with the dross. If the temperature is raised to lessen the adhesion of lead to the dross, copper is bound to remain in the bullion. In the following is given an analysis of the dross skimmed at smelter No. 3: Pb 91.9181, Ag 0.8122, Au 0.0038, Cu 2.8500, S 0.7598, As 2.2340, Sb 1.3400, Fe 0.0521, Ni trace, Co trace, Bi not determined. This dross was returned to the ore furnaces, instead of being worked with other undesirable material in a separate furnace.

The remelting of the furnace bullion and loading of the cars is done by contract at $4 a carload of 400 bars. This work includes the following manipulations: Tramming the bullion from the furnaces to the remelting pots, remelting, skimming, syphoning, cooling and numbering the bars, running them over two weighing machines, loading them on the cars, taking chip samples for the government assayer and stamping the Mexican eagle on each bar, and dumping the dross outside of the building. The samples for the works are taken by an American foreman out of the swivel pot while the bullion is running out of the kettle. This man receives $3.25 per shift. If a night foreman is required, he is paid $3. The weigher, a Mexican, is paid $2 a day. The cars are sealed with lead seals by a railway official with the exception of one door, which is sealed by a representative of the government assayer. No bullion car must be removed from the smelter yard without permission from the government assayer. These rules are very strict.

The flue dust saved amounts to 1.2% of the dry weight of the ore. Most of it is deposited, of course, under the down-comers, and it had to be drawn out of the dust flue, every day, into water troughs running parallel to the flue. After thorough incorporation with water, the flue dust is trammed to a wooden platform, where it is mixed with loam from the smelter yard and moulded into bricks by hand. When these bricks are sufficiently air-dried they are burned in a kiln to harden them. In this operation a partial roasting takes places, whereby heavy clouds of steam, sulphur dioxide and arsenious anhydrate are emitted. The flue dust bricks are 8½ inches long by 4¼ inches wide by 2½ inches thick, and weigh, after burning, 3¾ pounds apiece. The drawing, mixing and bricking of the flue dust costs $1.25 per thousand, and the setting of the kiln and burning $1.25 more. Hence a 2000-pound ton of burned flue dust bricks costs $1.33 to make.

The handling of the flue dust, especially that from the calciners, is very injurious to the limbs of the workmen. By using a good bricking machine this could be overcome, and at the same time the burning would become unnecessary.

The average composition of the burned flue dust brick is as follows: SiO_2 19.0, Fe 22.0, CaO 6.0, Zn 2.0, S 2.4, Pb 16.2, Ag 28.6 ounces, Au 0.105 ounces.

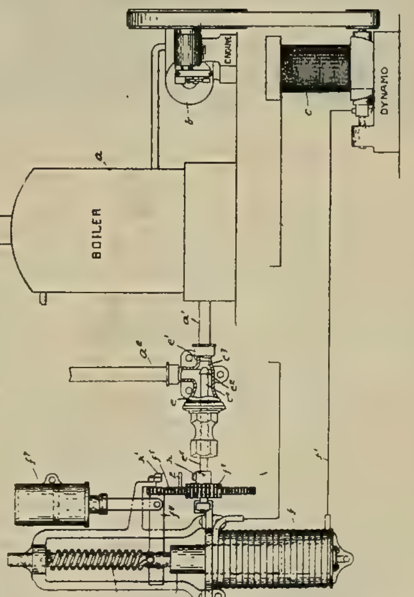
Mining and Metallurgical Patents.

Patents Issued August 21, 1900.

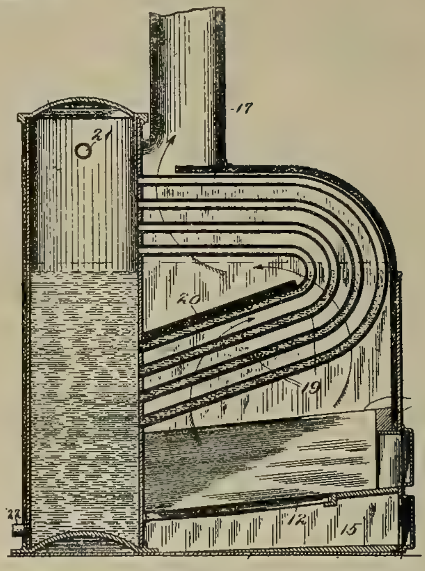
Spec'ally Reported for the MINING AND SCIENTIFIC PRESS.

ELECTRIC GENERATING APPARATUS.—No. 656,165; J. H. Bickford, Salem, Mass.



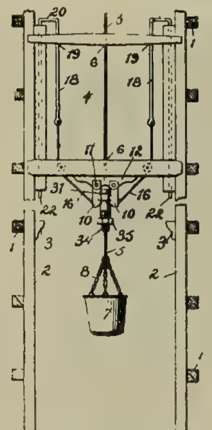
An electric generating apparatus comprising steam generator, engine and dynamo, burner for steam generator, valve controlling supply of fuel to burner, automatic means for operating valve operated by circuit of dynamo and means for opening valve independently of automatic means which serves as means for throwing automatic means into action and which is in turn operated by automatic means to close valve.

WATER TUBE BOILER.—No. 656,193; W. L. Jancey, Chicago, Ill.



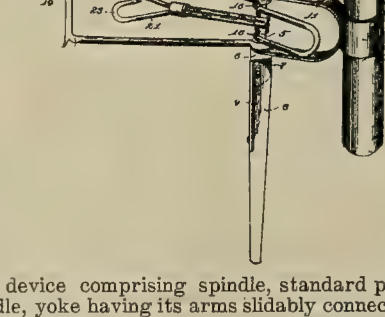
In a water tube boiler and furnace therefor, in combination, furnace having combustion chamber; vertical drum, plurality of bowed circulating tubes projecting into combustion chamber, both ends of each tube entering drum above fire grate and at different elevations, lower arm of each tube being inclined upwardly from its end, upper arm thereof being substantially horizontal; deflecting plate extending from drum between arms of several tubes, whereby line of draft is caused to substantially follow line of tubes.

SAFETY DEVICE FOR MINES.—No. 656,204; D. McCowan, Neihart, Mont.



Combination with guides, crosshead moving thereon, bucket rope passing loosely through crosshead, and supports on guides; clutch having spring actuated members pivoted to lower crossbar on crosshead, rope clamp which members are adapted to engage, chains or cords leading from members outward and over pulleys in crossbar, and rods extending from chains or cords upward through top crossbar, thence outward, thence downward through holes in side bars of crosshead, and projecting below latter so as to rest upon supports.

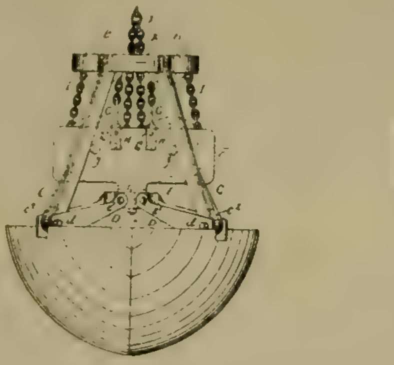
MINER'S CANDLESTICK.—No. 656,209; C. Peacock, Altman, Colo.



A device comprising spindle, standard pivoted to spindle, yoke having its arms slidably connected with spindle, candle holding clip pivoted to bight of yoke, attaching device consisting of a U-shaped, spring wire having its end adjacent bight wrapped around spindle between ends of yoke, and having its opposite end portions bent toward each other to form shoulders and then outwardly to form attaching fingers, and having oppositely disposed spikes at the shoulders, and second attaching device comprising wires wrapped around spindle between sides of first wire and having hooks, spindle having clamping nut engaged therewith to clamp attaching devices and yoke against pivotal movement on spindle.

◆

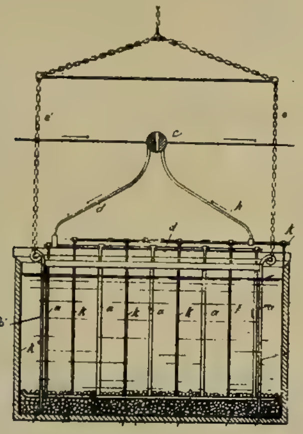
DREDGING BUCKET.—No. 656,224; C. H. Smith, Jersey City. N. J.



In a bucket head block with bifurcated lugs and housing; two pulleys journaled in head block; cross-shaped bottom block, ends of cross constituting journal boxes, and block vertically drilled through its center for bolt; housing consisting of two vertical sides and horizontal bottom drilled for bolt to secure it to bottom block; two sheaves turning on parallel and horizontal axles secured in housing; links consisting of two parallel portions open at lower ends; filler between open ends of links; approximately right angular braces pinned to bottom block riveted to sections of bucket; spherical shaped bucket sections, disposed so that adjacent edges meet at obtuse angles; U-shaped straps secured to sheave housing; chain linked to straps running over pulleys and under sheaves; eyebolts with chain secured to head block.

◆

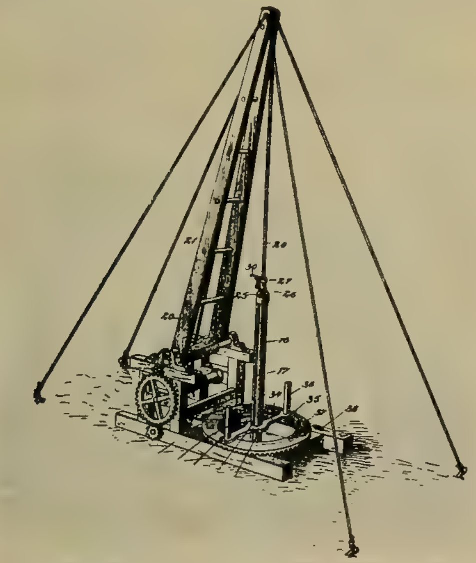
PROCESS OF ELECTROLYTICALLY EXTRACTING ZINC FROM ORES.—No. 656,305; W. Strzoda, Falenze, Germany.



The process of electrolytically extracting zinc from its ores, placing disintegrated or pulverized ore in its natural state in an electrolytic vat containing an aqueous alkali metal solution capable of dissolving ore with production of a zincate and in direct contact with cathode, closing circuit through vat, thereby precipitating zinc and alkali metal at cathode, alkali metal reacting with water to regenerate solvent solution.

◆

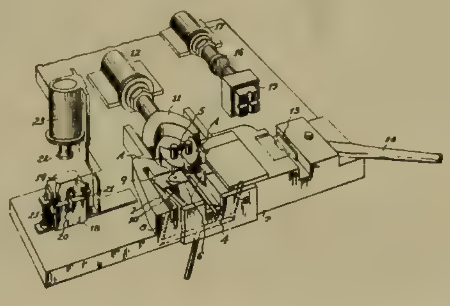
TELESCOPIC DRILL SHAFT.—No. 656,515; I. N. and W. J. Cassity, Holton, Kans.



Boring shaft comprising hollow telescopic sections, means for attachment of bit to lowermost section, means for attachment of rope to lowermost section, single rope passed through sections connected with lowermost section through medium of attaching means, means for holding sections against rotation with respect to each other through their telescopic movements, rope clamp carried by uppermost section for engaging rope to permit adjustment of sections, to permit bodily movement of shaft upwardly and downwardly and to support shaft, and means slidably connected with uppermost section for rotating shaft.

◆

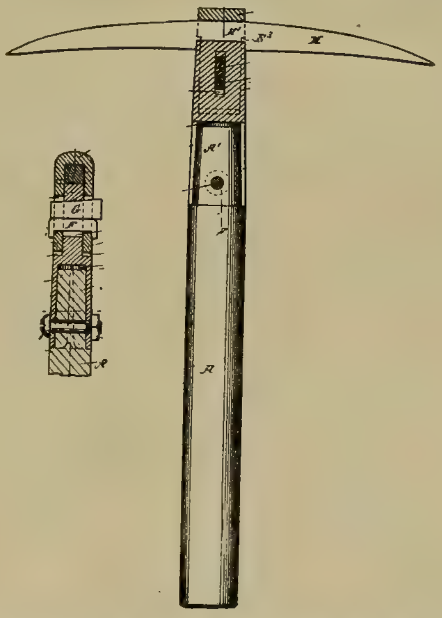
MACHINE FOR SPREADING, TRUING AND GAGING DRILLS.—No. 656,415; D. G. Morgan, Quartz Mountain, Cal.



In a machine of character described, hinged adjustable clamps and mechanism by which they are closed to grip drill shank between them, spring pressed lever arms having grooves in ends within which grooves horizontal bits of drill are fitted, hammer having converging channel adapted to engage and close outer ends of levers and to correspondingly spread grooved ends and extend bits.

◆

PICK.—No. 656,498; W. P. Bevington, Escondido, Cal.



Combination of handle, head having at end split socket for reception of handle, and upper end soild portion I-shaped in horizontal cross-section, forming longitudinal channels in opposite sides of head, channels being connected by an aperture extending through central member of I-shaped section, bolt passing through handle and through split socket, U-shaped clamp, side members of which slide in channels and have cross apertures registering with that head, shoulders projecting over parallel end members of I-shaped section, pick held between upper end of head and central member of clamp, key extending through apertures of clamp and head and having bent ends engaging clamp members exteriorly, and wedge extending through same apertures, engaging key and head.

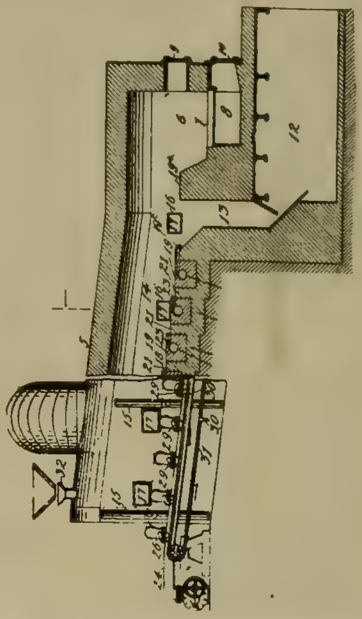
◆

PROCESS OF TREATING ZINC BEARING COMPLEX ORES FOR RECOVERY OF ZINC OR OTHER METALS THEREFROM.—No. 656,497; G. De Bechi, Paris, France.

A method of treating complex zinc ores for recovery therefrom of copper, zinc and lead, consisting in separately roasting ore and an alkali chloride in presence of air and steam, conveying sulphurous and sulphuric vapors thus derived from ore over and in contact with chloride during roasting to obtain hydrochloric acid fumes, condensing acid fumes in water, eliminating any sulphuric acid from acid water and eliminating any soluble sulphate from roasted ore as insoluble calcium sulphate by addition thereto of solution of calcium chloride, lixiviating ore with acid liquor to obtain solution of metallic chlorides, and successively precipitating metals of metallic chlorides as hydrates by successive additions of lime, heating zinc hydrate thus obtained in presence of air to drive off any combined chlorine, condensing any zinc that may be driven off with chlorine, mixing residue of calcined zinc oxide with carbon, compressing mixture to increase its density, and then retorting compressed mixture.

◆

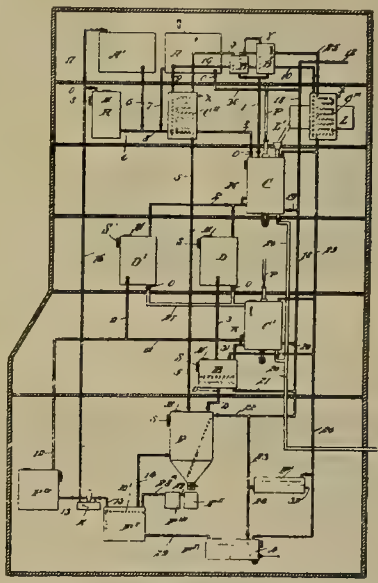
CALCINING OR ROASTING FURNACE.—No. 656,580; A. E. Johnson, Victor, Colo.



Calcining or roasting furnace, combination of stepped hearth, air conduit located outside furnace, pressure source with which conduit is connected, branch pipes connected with conduit, wall and hearth provided with openings leading to various steps and with which branch pipes are connected, valves located in branch pipes, valve spindles, cranks mounted on spindles and normally holding valves closed, exterior means arranged to engage cranks and open valves at suitable intervals.

◆

PROCESS OF TREATING GOLD AND SILVER ORES.—No. 656,544; H. Hirsching, Salt Lake City, Utah, assignor to the Mineral Union, Limited, Phœnix, Ariz.



Process for treating copper ores, which consists in adding comminuted ore gradually under agitation to an ammoniated solution, diluting solution, separating it from slimes, washing or leaching slimes separately, and subjecting residue of slimes to action of steam to extract ammonia therefrom.

◆

PROCESS OF LEACHING ORES OR TAILINGS.—No. 656,395; E. H. Dickie, Bodie, Cal.

Leaching ores or tailings with solution which dissolves precious metals, which consists in adding to solution an agent composed of an acetate of an alkali metal or of alkali earth metal capable of readily uniting with and forming acetates of base metals, and which has little or no affinity for precious metals, thereby enabling solvent to act directly upon latter, and then leaching the ores; the improvement in leaching with cyanide solutions, consisting in adding to such solutions calcium acetate in proportions of approximately five parts of potassium cyanide to one part of acetate.

◆

A PRACTICAL expression of admiration of General Baden-Powell has been made by a group of miners in Queensland, who have presented him with a cake of pure gold on which is inscribed: "This is 24-carat, what the Croydon miners take you to be."

A Crude Ore Feeder.

Written for the MINING AND SCIENTIFIC PRESS by S. I. HALLETT, Aspen, Colo.

One of the hardest things to handle through a feeder is the crude ore as it comes from the mine—large lumps, fine ore and medium-size rocks altogether in one bunch. It is well known that it requires as much power in a crusher to handle damp sand when it packs as it does to crush the hardest rock; and if ore as it comes from the mine is fed directly to the crusher, both coarse and fine, the fine will fill the interstices between the larger boulders and a great waste of power is the result. This power required (that is entirely unnecessary) is very much larger than is generally supposed. Theoretically, all of this fine should be separated from the coarse before the coarse ore is fed to a crusher. It has been hard to find, as I said, a feeder that will remedy this difficulty, the ore varying from the size of a foot square or larger down to the finest sand.

Feeder for Crude Ore.

The kind of feeder, of which the accompanying is a drawing, has been in use by me for a long time and answers the purpose perfectly, so that every bit of power applied to the crusher is expended in breaking rock and not in compressing fine material. The feeder is fixed directly to the bin from which the crusher is fed. The bottom of the feeder is in the shape of a grizzly and is movable, being turned by an eccentric which alternately moves forward and backward. This allows the fine ore to pass through the grizzly; and, as the coarser ore is moved forward, the ore in the bin falls behind it and on the return movement of the feeder it slips from in underneath these coarser lumps and of course they fall off, the amount fed at each discharge being regulated by the gate. In practice, from the feeder to the crusher the ore is fed over a stationary grizzly that is placed at such an angle that all rock will run down, the finer (if any has been left) falling through the spaces in the grizzly. The continual forward and backward movement of the bottom of the feeder furnishes agitation enough to the ore to liberate the fine.

The pulley for the eccentric that moves this table or grizzly is shown in the drawing.

I think the object desired and the method of doing it is sufficiently shown in the drawings to need no extensive discussion of the pieces required.

Rand Mines During the War.

J. Klimke, ex-State Mining Engineer of the Transvaal, is in London from South Africa, and to the African Review makes interesting statement with reference to mining operations carried on by the Transvaal Government during the war. The Transvaal Government, disapproving of his direction of mining affairs on the Rand, offered him leave of absence for an indefinite period. He thereupon resigned.

The first mines to be taken over by the Transvaal Government were the Robinson, Bonanza, Ferreira Deep and Rose Deep. Government mining inspectors were put in as managers, and reported that they had great difficulties in starting the mines. They found that a great many repairs were necessary, and, as nearly all the mining men had left the country, it was not easy to carry out these repairs. As soon as they were done, however, the managers revised and brought up to date the plans of each mine. In one or two cases work had been done in the mines which was not shown in the plans, and in these cases the drawings were amended. Regular surveys of the mines were carried out and the results recorded on the plans, which constitute an accurate record of the work done in the mines by the Boers from October 10 to the end of May, the period of their operation. These four Government mines were worked entirely in the interests of the Government, and in order to profit to the fullest extent it worked the richest stopes, did no development work whatever, and reduced the Kaffir wages to an average of £1 per month, for the Government did not want more natives on the Rand than were absolutely necessary. In order to make the Kaffir rate of pay uniform a notice was inserted in the Staats Courant enacting that every manager who paid more than £1 per month would be fined £10 for each offense, and it also forbade a manager to receive into his compound natives from another mine under pain of a similar penalty. Thus the Government was able to work the mines at much lower working costs than had hitherto been possible. In course of time six other mines—the Ferreira, the Village Main Reef, the Wemmer, the Worcester, the Geldenhuis Estate and the Langlaate Deep—were started working, under the control of the companies' own managers. If these mines were not worked in the interests of the shareholders it was the managers' own fault. The Government did not interfere in any way with their working of the mines. It only stipulated that all the gold produced should be handed over to the State Treasury, and in return it promised to pay all the costs of working. It did not keep this promise, however, and has left the ten mines worked in its enterests with liabilities amounting in the aggregate to over a quarter of a million sterling. However, the damage to the mines has been confined to the ore actually extracted—apart from the consideration that no development work was done—and the Government mines, as they are called, are in this position to-day, that they can resume work at any time. As regards the mines not worked in the interests of the Government, no damage has been done to them as far as one could see. There will certainly be some repairs necessary—this is always unavoidable when a mine has been closed down for any length of time—but no damage has been done other than is natural.

With regard to the gold production, Mr. Klimke furnished the following figures, which are claimed to comprise the only complete and authentic return of the results of the Transvaal Government's mining operations yet published. The appended table covers the period from the beginning of the war (October 10) to April 30 last:

MINES.	Ozs. (fine) according to mine assays.	Value according to statements of managers. £	s.	d.	Approx. amounts of unpaid working costs. £
Robinson	102,926	428,069	0	0	47,073
Bonanza	52,929.33	213,329	0	0	14,271
Rose Deep	44,310.06	155,350	12	3	60,322
Ferreira Deep	54,213.10	227,695	0	0	30,019
Ferreira	58,511.75	211,690	3	11	43,488
Village Main Reef	48,120.50	203,992	13	5	25,286
Wemmer	37,274.87	157,965	6	0	11,767
Worcester	10,096	38,635	0	0	17,518
Geldenhuis Estate	9,960.30	34,898	10	5	8,125
Langlaagte Deep	10,919	38,924	0	0	10,927
Totals	428,270.89	1,710,549	6	0	265,761

To these totals the figures for May, the concluding month of Boer operations, must be added. Mr. Klimke estimates the May output of the ten mines worked at about 60,000 ounces, of the value of £240,000. There is also to be added the output of the Crown Reef, which was crushing the ore from the dumps until the end of March, and the gold obtained from the plates, mortars, etc., of the non-working mines which were cleaned by the Government. "The exact amount of the gold thus obtained," says Mr. Klimke, "will probably never be ascertained. Making only a moderate allowance for these items, it will be seen that gold to the value of £2,000,000 has been extracted by the Transvaal Government from the mines of the Witwatersrand. It has paid in working costs, Mr. Klimke estimates, about £500,000, and thus has made a profit on its mining operations of about £1,500,000.

"Will the Transvaal Government repay the debt, do you think?" was asked.

"Mr. Klimke smiled. "I would prefer not to express any opinion," he answered.

"Do you think it will be long before the mines are fully at work again?"

"In my opinion it will take at least one year after the conclusion of the war to bring the mines into full swing again—that is to say, to return to the average production of the working nine months of last year."

Exhibits of the Ericsson Telephone Company.

An exhibition which will interest many was made by the Ericsson Telephone Co. of 296 Broadway, New York City, at the meeting at Cleveland, Ohio, last month of the Independence Telephone Association of

the United States of America, and on June 20th, 21st and 22nd, at Detroit, Mich., at the meeting of the Railway Telegraph Superintendents' Association, as is shown in the accompanying cut.

The telephones exhibited made a fine display and were of those patterns sold for exchange and railway use, as follows: No. 250, with adjustable arm transmitter; No. 200, with transmitter fitted to the lid of the generator, or magnet box, and both finished in walnut and oak; No. 390, designed for use at terminal or extensions of lines, and also as a testing instrument, if desired; No. 375, an imported Swedish desk set, a complete telephone in itself, with generator bells and combination transmitter and receiver; No. 213, all-nickel desk set of American pattern; No. 311, imported Swedish wall set, in both oak and walnut; No. 175, wall or desk set, equally well adapted for both uses, and easily changed from one position to the other. There were also repeating coils, transmitters, receivers, batteries, etc. The instruments were connected up with the metallic circuit switchboard, and the operation of the board showed the ease with which it can be operated and how readily and quickly the wanted connection is made. The board is a model of beauty, and is finished perfectly in every detail, made with metal parts in bright brass or nickel finish, woodwork of mahogany, and all showing the fine workmanship and handsome appearance for which these well known goods are becoming noted. While the manner in which these instruments are finished proves very attractive to the eye, the positive way in which they do their work, compactness, and, above all, the sensitive and yet durable transmitters and receivers retain the favorable impression and confirm the many good words so frequently heard with reference to the high quality of these goods.

The company was represented by Messrs. J. F. Hemenway and J. A. Montague at both of the meetings.

The Tropenas Steel Process.

Last November the Union Iron Works of San Francisco, Cal., made its first steel casting by the Tropenas process at their 10-ton converter at the Potrero. This whole subject was gone into in an illustrated article in the issue of Dec. 31, 1898. Further technical reference is in order.

The Tropenas process consists in the use of a special converter, into which the pig iron, melted beforehand, is treated and converted into steel. This vessel, like all other converters, is a sheet steel shell, lined inside with refractory bricks or ganister. The shell is fitted with two hollow trunnions carried on two pedestals, so that the apparatus may be tilted according to the requirements of the operation—i. e., charging the melted pig iron, pouring the steel, etc. The inside of the converter is so arranged that the metallic bath has a much greater depth or thickness than in all the other pneumatic processes. It is conical for small charges and cylindrical for large ones. Upon one of the faces of the converter, and in a plane parallel to the axis of the trunnions, are fixed two wind boxes, connected by a conduit to the hollow trunnion communicating with the blowing apparatus. These two wind boxes are entirely independent of each other. Inside of the lower wind box a row of horizontal tuyeres terminate. These tuyeres are large in diameter, varying from 1¼ inches to 2 inches, according to the size of the converter. They open into the converter high enough to be always above the surface of the metallic bath. In the upper wind box a second row of tuyeres is placed. They are flattened and their free section is equal to about three-quarters of that of the lower tuyeres. This row of tuyeres is placed above the lower row, the distance varying from 4 inches to 7 inches, according to the capacity of the converter. The upper wind box is connected to the air main by an independent pipe, fitted with a valve, allowing to regulate, at will, the flow of air discharged by the top tuyeres or to suppress it entirely. Lastly, in the horizontal plane all the tuyeres are so placed that they can not communicate any gyratory motion to the metallic bath.

When the melted pig iron has been run into the converter, the latter is turned up in such a manner as to bring the lower tuyeres near the metallic bath, but always above it. The top tuyeres air valve is now closed. Then blowing is commenced in this position until the carbon flame appears. When the operation is well under way, the top tuyeres valve is opened so as to admit through these tuyeres a supplementary quantity of air, which penetrates into the converter at a certain height above the metallic bath. This air meets the gases escaping from the metallic bath and burns them, thus producing a zone of high temperature, which, by radiation, considerably increases the heat of the charge. The operation is stopped when the flame disappears. This corresponds to extra soft steel. Recarbonization is then made in the converter by means of a final addition, accurately weighed, thus allowing to produce exactly the hardness and quality of steel required.

The blast pressure required for good working varies between three and four pounds per square inch, according to the kind of pig iron treated. The blast can be produced by means of a blowing engine or by a rotary positive pressure blower.

By what has been said above it is apparent that the characteristic features of the Tropenas process are the following:

1. Low pressure blast, always above the surface of the metal and through the lower or fining tuyeres.
2. Disposition of the tuyeres in the horizontal plane, so that the jets of air, arriving above the bath, can not impart to the latter any gyratory motion whatever.
3. Great depth of the metallic bath, so as to avoid the churning and stirring of the latter during the operation.
4. Arrangements above the fining tuyeres, independent of the latter, of a supplementary row of combustion tuyeres, so as to burn the combustible gases escaping from the metallic bath and thus increasing the final heat of the steel.

Objection has been made to surface blowing on the ground that a greater quantity of iron is burnt than with bottom blowing, as in the Bessemer vessel. This is true to a degree. During a certain period of the operation there is a little more red-brown smoke than in the Bessemer operation, but the loss of iron resulting does not exceed from 1% to 1½%. The low pressure of the blast greatly attenuates this loss, which evidently would be much greater if the high pressure necessary with the Bessemer process was made use of. However, acknowledging this loss, it is easy to account for when making out the cost price.

On the other hand, blowing above the surface gives a better quality of steel than some of the other pneumatic processes, which blow from the bottom or more or less below the surface of the metallic bath. During the whole time of the Tropenas operation the bath remains perfectly quiet, and this is entirely different from all the other processes, in which a continuous mixture of metal scoria and air takes place. The steel produced by this process is purer and contains hardly any gas in dissolution. The operation being particularly quiet, there is no projection of steel, or very little, through the neck of the converter, contrarily to what occurs in the Bessemer; hence the saving of metal on this score compensates for the loss of from 1% to 1½% due to the greater oxidation resulting from blowing upon the surface.

By the use of the top tuyeres the carbonic oxide gas arising from the metallic bath is transformed into carbonic acid gas, thus greatly increasing the temperature of the final steel without increasing the cost price. This is accomplished by merely burning, in a practical manner, the gases, which all the other processes discharge, without utilizing, into the atmosphere.

The steel obtained being hotter, and consequently more fluid, allows the gases to escape more easily, and when the metal is poured into the moulds it is perfectly quiet. Owing to its high temperature and consequent great fluidity the pouring is much easier and the steel produced is better utilized, as no skull remains at the bottom of the ladles.

At the end of the Tropenas operation, before any final addition is made, the product obtained is practically pure iron. This enables the production, currently, of a very large number of steel castings for dynamos and other similar uses, possessing a very great magnetic permeability, and which, when analyzed, show from 99.75% to 99.80% of pure iron. These pieces are particularly sound, and when machined show no blowholes or similar defects. With the Tropenas metal, produced in such a state of purity and at such a high temperature, it is possible to make varied final additions with the view of producing different qualities of steel, from the softest to the hardest, and all the intermediate grades, by modifying the final addition according to the product required.

The waste of metal during the operation has been the object of special researches. The average, taken from a great number of operations, shows that the loss at the cupola varies between 5% and 6½%. The waste at the converter during the blow varies between 10% and 12½%. The average total loss in the cupola and converter is therefore about 17%. This loss is not excessive when it is considered that it applies to small converters and that the pig iron generally used for manufacturing steel castings contains from 2½% to 3½% of silicon.

The pig iron usually employed in the process for manufacturing steel castings has the following analysis:

	Per cent.
Silicon	2.50 to 3.50
Manganese	0.50 to 1.25
Carbon	3.00 to 4.50
Sulphur	0.03 to 0.06
Phosphorus	0.04 to 0.06

The freer the pig iron is from sulphur and phosphorus the better the results. However, when the results required are merely those needed for navy and railroad use, ordinary Bessemer pig iron containing not over sulphur 0.06 and phosphorus 0.05 can be used. When the steel produced is to be submitted to particularly severe tests, it is better to use a pig iron as devoid as possible from sulphur and phosphorus.

The sands necessary for making moulds are siliceous sands containing a sufficient proportion of alumina to give the moulds the required hardness.

All machinery castings having to be machined upon several faces must be cast in dried moulds, also large castings with great thicknesses. Less important castings, which slight defects (such as pin holes, slight scale, etc.) do not render useless, are cast in green sand moulds not dried. In the majority of foundries using this process, a great proportion of the castings are cast in green sand moulds not dried or merely skin-dried. The greater part of the small castings are cast in the same manner.

When the castings are taken out of the moulds, it is not indispensable to reheat them. The steel as it comes from the converter is soft and malleable. The great majority of castings are neither reheated nor annealed. When pieces, however, have great or uneven thicknesses, or when they are of a great bulk, it is preferable to reheat them for a few hours at a cherry-red heat in an ordinary furnace, without the use of any iron ore or other recarbonizing elements. The object of such a reheating is to transform the crystalline structure of pieces having great thicknesses into a finer grain, or to relieve the molecular tensions due to the considerable shrinkage of steel when the castings have a great bulk. Reheating is also necessary when high mechanical results are to be obtained, and principally when a great elongation is required.

The installation of the steel process proper requires, first, one or several converters, according to the quantity of steel to be produced. Each converter works in connection with a cupola; the latter is generally placed upon a metallic platform high enough to allow the melted pig iron to run direct to the cupola into the converter. The cupola is operated in the usual manner by means of a fan or a positive pressure blower. The air blast for the converter can be produced by means of a rotary positive pressure blower, the air pressure being only from three to four pounds per square inch. The quantity of compressed air required is from 22 to 25 c. m. per minute (776 to 883 cubic feet) per ton of pig iron to be treated. The expenditure necessary for a plant consisting of two one-ton converters, two cupolas and their platforms, fans and rotary positive pressure blower, is about $6500, erection included. The cost of two two-ton converters, two cupolas, platforms, fans and blower is about $8500, erection included. To this must be added the cost of a crucible furnace for final additions, which are generally made in a melted state. The expenditure for such a furnace is a small one and does not exceed from $150 to $200. Besides the steel-producing plant proper, the usual foundry apparatus are necessary, such as flasks, ladles, tumblers, reheating furnace, ovens for drying cores, moulds and hand ladles, sand crushers and mixers, forges for smithy, tools for cutting headers, cranes, etc.

Each operation in the converter lasts from fifteen to twenty minutes. Some time is required for pouring the steel into the moulds and for repairing the converter for another blow. When small pieces are manufactured and the whole charge has to be poured by means of hand ladles forty minutes are necessary for a complete operation. When the pouring is made with large ladles it requires only thirty minutes. In the first case three operations can be made every two hours, and four operations in the second case. With such data it is easy to calculate what quantity of steel can be produced when working eight hours per day.

The converter lining lasts from 125 to 150 operations, and the tuyeres from thirty to forty operations, after which the latter must be replaced. While this is being done the necessary patching up of the lining is made according to requirements. If some holes have been formed they can be plugged by means of a mixture of cement and brick. The linings are made with silica bricks, the cement being composed of quartz, sand and clay.

The cost of producing the steel varies from $5 to $6 per ton of 2200 pounds over and above the cost of pig iron. This includes all expenses incurred at the blowing apparatus, cupolas, labor, lining, tuyeres, and all general expenses for the manufacture of steel in the ladle ready to pour. These prices are the result of the accounts of works in normal operation for several years and in which the yearly output is about 2500 tons.

Henry C. Wulf, the chemist and metallurgist of the Union Iron Works, whose services in the above are cordially recognized, says that for U. S. Government requirements the phosphorus in steel is limited to .06%. Should it contain .001% above that it is rejected, and in blowing it has to be constantly borne in mind that the metal must be of a certain composition to meet the rigid physical requirements of the Government in tensile strength, elongation, elastic limit, reduction of area, quenching test and bending.

At Cape Nome, Alaska.

Our Nome, Alaska, special correspondent sends us some photographs from which was engraved the plate on the front page of this issue, which gives a good idea of the present appearance of things in that most northern American gold mining camp. Advices from there received this week confirm the former statements published herein, viz., that while the place was originally wonderfully rich in gold, it was worked out and overrun by experienced Klondikers before the first shipload arrived; that everything is overdone and those who can are leaving.

Siberian Gold Fields.

A recently published work by M. de Batz gives information about the gold-bearing strata, climate, etc., of Siberia.

In the mining districts of Tomsk, Tobolsk, Akmolinsk, Semipalatinsk and Semirechensk gold is found in the tributaries of the Ob. New considerable up-to-date diggings are confined to the affluents of Lake Zaissan and the Narim and Black Irkutsk rivers.

In the Maritime province there is one group of concessions in the basin of the Amur and another on the island of Askold, where the sea bed, which consists of auriferous sand, is worked in a perfunctory way.

The gold workings of the Amur constitute four groups, distributed over the left tributaries of the Amur river. In West Transbaikalia diggings are confined to the affluents of the Chikoi, a tributary of the Selenga, which empties into the Baikal, a tributary of the Yenisei.

The Lena mining district comprises the region traversed by the lesser hills of the Yabloni mountains.

The virgin forest zone in Siberia abounds in bogs and swamps, the ground being frozen, and has a series of river and torrent systems, which may for the purpose of general classification be called (a) the Podkammennaya Toungounska system, (b) the Great Pit system and (c) the system of the Yenisei and its tributaries. The Great Pit forms the boundary between the north and south districts.

In the Lena district the gravel is very poor and difficult to work. The district of Biruginsk is the poorest locality within this jurisdiction, although at one time it occupied the foremost place in Siberia as a gold-producing district.

In the district of the Altais gold is worked on the tributaries of the Ob. The placers on the left bank of the Tom are worked by the companies of St. Petersburg with special permission of the Czar. The right bank is free, and diggings are to be found on the river Tom, Alkan Choulichman, Upper Katoun Benshtarma, etc.

The auriferous area extends over the slope of the mountain ridge, which, rising from the steppes of Turkestan and dying away as it skirts the sea of Okhotsk, traverses obliquely the Asiatic continent from southwest to northeast. From the meridian of Tobolsk to the Pacific the range is about 4300 miles long, with an average breadth of nearly 400 miles and an area of over 1,600,000 square miles. This country has only been superficially prospected, because roads are lacking and it is impossible to penetrate those primeval Siberian forests in summer and to prospect in winter, when every outcrop and surface indication is buried beneath the snow, not an inviting nor profitable undertaking.

The work of government exploration in the eastern portion has not proceeded beyond 62° latitude, although the existence of a rich auriferous vein is known in the mountains, between the Lena and the Ayan.

The Siberian placers are situated on the north and northeast of the great mountainous plateau described.

This vast plain, intersected by important rivers—the Wenga, Angara, Yenisei (nearly 3000 miles long), Ob (over 2600 miles), Lena (more than 2000 miles) and the Amur (2600 miles)—still shows traces of great glacial activity. The origin of the Siberian placers, judging from researches made in other parts of the world—the United States, Australia and Europe—may be accounted for as follows:

The Silurian or Devonian mud, on account of the auriferous pyrites it contains, M. de Batz regards as the almost universal source of gold. This was upturned at the period of the formation of the Asiatic ridge, and at the same time was fissured or broken. The fissures, filled with quartz and pyrites torn from the schist by the action of the waters, became the veins already found. Subsequently, the powerful action of the glacial period gave rise to the placers which are now being worked.

If this theory of the formation of auriferous alluvia, which has been verified in other great gold-producing countries, proves true of Siberia, then it is to the south of the localities at present worked that a systematic search for the primitive strata ought to be carried out.

The Altais contains veins of lead, silver and copper; numerous specimens of all kinds of minerals have been brought from that region by hunters and foresters. It is in these hills, with their westerly continuations, and in the mountainous mass which strikes out from Manchuria in a northeasterly direction that the wealth of Siberia must be sought.

The chain of the Khingan, "Mountain of Gold," is said to be rich in minerals, and it is doubtless from these hills and their spurs that the gold in placers of the Ussuri and the Amur lower portion was brought. The same reasoning holds good for the hills bordering on the sea of Okhotsk.

The great extent of the regions covered with auriferous sands in Siberia is the cause of the difficulty experienced in examining them systematically. The impenetrable virgin forests at the north, with their luxurious vegetation, fallen trees and marshy soil prove an obstacle to geological research. It is impossible, in the majority of cases, to follow the different strata, recognize outcrops or ascertain the nature of the subsoil.

It was not until 1886 that the want of a school of geology at Irkutsk made itself felt, although as far back as the year 1843 the Department of Mines had sent Col. Hofman to Siberia to study the gold deposits. The information obtainable on the subject of Siberian placers is scattered through a great number of monographs; and until the geological committee of the Great Siberian railroad publishes the result of their labors, it will be difficult to treat the subject comprehensively. In contrast with the great strata of the Sierra Nevada mountains in California and in British Columbia, which belong to the pre-Tertiary period, as attested by the volcanic matter with which they are covered, the alluvia of Siberia belong to the Quaternary epoch and are of recent formation.

Siberian placers are situated in valleys having usually a gentle fall and often marshy. Their distinctive feature is that the pay gravel above the bedrock is covered, in the immense majority of cases, with an unproductive layer of soil.

Auriferous localities are also generally characterized by the presence of low, rounded hills, testifying to the intensely destructive action of the atmospheric agents upon the rocky conformation of the country. The placers are found at a moderate altitude above sea level. In the Urals they are met with at a height varying from 500 to 1000 feet; in the Alatau mountains at 2000 feet; in the valley of the Olekma from 2000 to 2500 feet; and in the Yenisei from 2500 to 3000 feet.

In addition to native gold, frequently found in nuggets, iron pyrites, often in the form of mispickel, and all the products of its decomposition, such as magnetic oxide, limonite, hematite, etc., are met with in Siberian gravels. Copper is found, sometimes native, sometimes in the form of copper pyrites; lead has been discovered as sulphate, carbonate, phosphate or sulphuret. Native bismuth has been found in the valley of the North Yenisei and in certain valleys of the Altai. Among the hard stones, garnets, rutile, tourmaline, zircon, peroxide of tin, etc., are found.

The organic remains are most generally those of the mammoth. In 1840, it was calculated that more than 2000 of these animals were found: some, with portions of their bodies still soft, were discovered in the frozen clays of the extreme north. The woolly rhinoceros (rhinoceros tichorinus) is also frequently met with. The state of preservation of these mammoths- animals which required abundant vegetation—indicates, in a striking fashion, the rapidity with which the glacial period must have enveloped the vast plains of Siberia.

Human remains have also been found—a skull at a depth of 10 feet in the Chtogolev mine in 1860, ancient hearths, also a stone slab, with inscriptions, in a mine in the basin of the Kigas.

A feature altogether peculiar to the Siberian placers, especially those in the district of the Lena, Zeya, etc., is that the soil remains perpetually frost-bound or thaws only slightly in the summer time. Near the sources of the rivers, places are found not frozen: these are said to be caused by warm or tepid springs beneath the surface of the earth.

The working of Siberia gold mines dates back only to the middle of the eighteenth century, at which period the first auriferous veins were discovered in the Urals and in the government of Archangel. Gold was discovered in the Ural mountains in 1744. Several veins situated on the banks of the river Beregofka were worked with varying success from 1800. In 1895 the output was 19.46 poods (703 pounds). In the southern Urals the first gold reef was discovered in 1799. The Kothkar reef yielded in 1894 about 85 poods (3069 pounds).

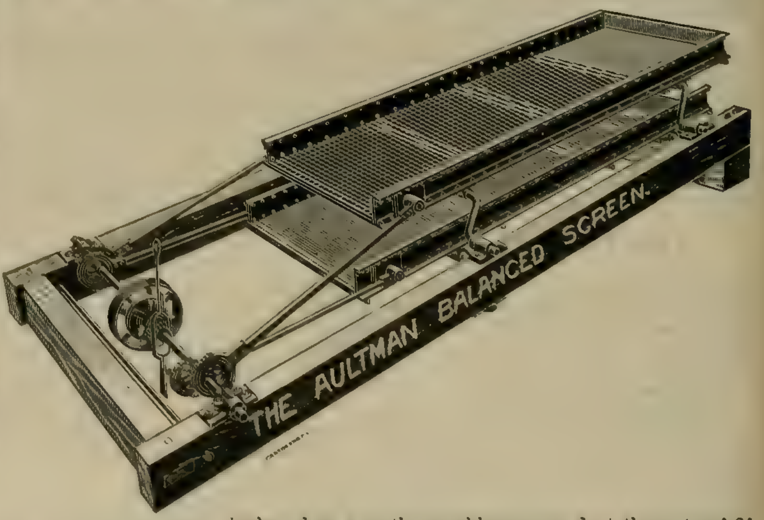
Toward the close of the period 1870 1879, reefs were discovered in the government of Yenisei and the province of Transbaikalia. In 1894 95 gold-bearing strata were found in the district of Marunsk, in the government of Tomsk.

In 1866 the Amur province was opened to private trade: two years later, mining was begun on the concessions belonging to the Upper Amur M. Co., in the basin of the Djalinda. At the same period, explorations were set on foot in the Maritime province, and in 1871 the first gold was taken from the mines belonging to a Mr. Yetukof, in the province of Amgoun. During the season of 1897 the Amgoun M. Co. treated 10,834 cubic sagens of gravel, from which about 55 poods of gold were extracted, giving an average of 7.825 grams to a cubic meter. On the other hand, the Amur M. Co. took out of their placers 20¼ poods (734 pounds), showing an average of more than 17.06 grams to a cubic meter:

Mr. Greener adds: "In 1896 the Government dispatched to the shores of the sea of Okhotsk an expedition which, according to the latest news, has found rich alluvial drifts. There have recently arrived at this port direct from the United States six practical American miners under the auspices of the Russo-Chinese bank. They are supplied with modern machinery, are men of experience and go to the Yumen, where rich discoveries are reported. These are the 'original forty-niners of the New California,' and it is hoped they will give new impetus to mining in the Maritime province. In conversation with one of them, who last winter prospected in the Yukon, Alaska, the idea was emphasized that the whole region about Anadirski and the extreme eastern range of the Stanovoi mountains, near Bering straits, would prove as rich as the Cape Nome region, since it was of analogous formation."

A Balanced Shaking Screen.

In the shaking screen herewith illustrated the forward and backward movement of the upper screen is counterbalanced by the reverse movement of the lower screen, the thrust of the moving parts being absorbed in the heavy countershaft. The screen frames are so placed on rocker arms that the screening surface always moves through the true arc. At each end of the stroke the material naturally raises slightly and is again forcibly caught by another portion of the screening surface. Favorable materials, sand, shale, fire clay, phosphate, cement and coal, when dry, are thoroughly screened at the rate of fifteen to twenty tons per hour, and when damp at the rate of ten to fifteen tons per hour. Dimensions: length of upper and lower screens, 14 feet; width, 3 feet; height over all, 26 inches; size of friction pulley, 24x6 inches; speed of countershaft, 250 R. P. M. Space required for screen complete on skids, 18x4½ feet. The frame carrying the wire cloth or perforated metal is in removable panels for convenience in renewing the wire cloth and to provide for changes in the fineness of separation. The Aultman Co., Canton, Ohio, are the manufacturers and solicit inquiries from interested parties.



Regarding Final Proofs.

In applications for patent the General Land Office requires that affidavits for publication, etc., shall be filed within a reasonable time, under penalty of forfeiture. It having been reported that Register Hobbs of the Salt Lake land office had declared thirty days the limit when such proofs will be received, Mr. Hobbs desires it understood that he has no right, and that he would not presume, to definitely interpret so vague a term as "a reasonable time." He stated, however, that, owing to lack of promptness on the part of applicants for patents, complications have arisen which have indefinitely deferred the issuing of patents in a large number of cases in his office, and advises applicants to avoid unnecessary delay in presenting proofs. Every quibble raised subsequent to advertising, if proof is not immediately presented, undergoes the delay of investigation.—Bingham, Utah, Bulletin.

Liable to Lead Poisoning.

TO THE EDITOR:—In the dry lead mines of this county, where much of the ore is shipped to San Francisco for reduction, lead poisoning is very common, and is well understood as one of the risks the miner takes in working in such mines. In some mines water is introduced to lay the dust and lessen the risk. I have seen many cases pronounced by physicians to be lead poisoning, and some have resulted in insanity so serious as to necessitate committing the patient to the asylum, where the subject had not been in any way connected with a smelter of any kind. W. G. T.

Independence, Inyo Co., Cal., Aug. 25.

◆

FLASHLIGHT pictures are now taken by an invention which has the gas stored in a jar, with a flame in position to ignite it when the jar is opened by pressure on a pneumatic bulb, the latter also operating the shutter of the camera.

MINING SUMMARY.

ARIZONA.

The Surveyor-General reports 105 surveys for patents during the year ending July 1, 1900, [illegible] for the corresponding twelve months preceding, [illegible].

GILA COUNTY.

A. Lockwood has bonded his interest in the Cracker Jack mine, [illegible], to Moses & Campbell. The Cracker Jack, comprising [illegible] claims, is [illegible] miles from Payson.

Silver King: At the United Globe mines and the Old Dominion Copper Co. after Sept. 1st all underground men will be paid $3.50 per day.—The shaft on the Black Warrior Co.'s Gold Gulch mine is down 125 feet.

GRAHAM COUNTY.

M. E. Terry, of the Gold Coin M. & D. Co. and associates are traveling over the country in search of good mines. They are camped at Thompson's station, 20 miles north of Lordsburg, prospecting.

MARICOPA COUNTY.

H. Dennison reports returns from a carload shipment of ore from his Pima mine, near Tempe, of 23% copper.

The Par Value G. M. Co. has incorporated at Phoenix; capital stock, $100,000.

The Sierra Vista Co. has fourteen claims, 30 miles north of Phoenix. Assays show copper and gold. Sixteen men are employed.

MOJAVE COUNTY.

Near Chloride the concentrating plant at the Tennessee mine, belonging to the Willapa M. Co., was recently burned. It had a daily capacity of 200 tons. All work is suspended at present, as the steam hoist at shaft No. 1 was undergoing repairs and the power was being taken from the engines in the burnt building. H. N. Botsford is Supt.

The mill at the Tennessee mine, Chloride, recently destroyed by fire, will be rebuilt. The loss was about $30,000; insurance $15,000.

PINAL COUNTY.

The County Supervisors have raised the assessment on the Mammoth mine, patented, from $2000 to $50,000, and on the Ray mines, patented, from $1000 to $25,000.

W. Lawrence has seventy-six ounces gold, representing a month's clean-up from the mine, 2 miles south of Dripping springs. The ledge is 2 feet wide and carries a rich streak 2 inches wide. The gold is in decomposed iron.

YAVAPAI COUNTY.

J. Shirley, Cherry creek, 15 miles from Jerome, contemplates an electric plant at the Etta.

The Eclipse, adjoining the Etta, will have a new 200-foot shaft.

G. W. Hull, Jerome, has a mine in the center of the town, said to contain copper ore. He is seeking to drive a tunnel from Bitter creek under the town of Jerome, connecting with the shaft he has down.

The Dewey group of twenty-five mining claims is sold to J. W. Dean of Denver and his associates for $100,000. It is in the Yeager canyon country, 8 miles from Jerome. The company will run a tunnel 500 feet.

YUMA COUNTY.

The Boston company which has for eighteen months been developing a copper property at Empire Flats, or Copper Basin, 15 miles below Needles, on the Arizona side, 3 miles from the river, reports satisfactory progress.

Manager T. M. Drennan of the Parker M. Co. is developing a gold property 30 miles down the Colorado from Needles, on the Arizona side, 9 miles above Copper basin, where the new smelter is going in. The ore is honeycombed quartz, carrying oxidized iron and gold.

CALIFORNIA.

AMADOR COUNTY.

At Sutter Creek the miners at the Wildman mine have been paid two months' back pay—$15,000. It is locally figured that the Wildman will change hands, and, with ample capital, will sink the shaft over 2000 feet.

At Jackson the new 60-stamp mill at the Oneida is completed and only awaits the installation of the transformers and other electrical appliances to be started. The mill building is 136x40 feet; the power room adjoins the mill on the north and is 40x80 feet; the clean-up, retort and furnace rooms, 12x32 feet, adjoin the mill on the south. There are twelve separate shafts, with five stamps to a shaft, each set of five stamps constituting a battery. Each stamp weighs 1200 pounds. An improved iron guide box is in use, enabling those in charge to take out each stamp at any time independent of the others comprising the battery; thirty concentrators are in place. A double-track tramway extends from the hoist to the ore bins; [illegible] of the mill is the [illegible]. The Standard Electric Co. will furnish power [illegible] of running [illegible] stamps. The [illegible] shaft has been [illegible], and [illegible] connection made between the [illegible] new shafts. The [illegible] is [illegible] feet deep, the new shaft over 2000 feet. [illegible] of 300 feet has been made in the [illegible] shaft.

At the [illegible] mine, near Pioneer, the crosscut tunnel has tapped the ledge. The mine is under the management of T. Schenck.

At the [illegible] mine, between Pine Grove and Volcano, ten stamps will be running this month.

At the [illegible] mine near Clinton, [illegible] & [illegible] [illegible] are [illegible] ore [illegible].

At the [illegible] mining will be resumed when the mill is ready to run.

BUTTE COUNTY.

Wm. Stephens will have charge of the 10-stamp mill to be erected at Bloomer Hill.

Twenty men are employed by the Cherokee Co. putting the mine in shape for work when the dam is completed. It is expected that by the 20th inst. the tunnel now being run by the Banner Co. will be finished and water sent from Cherokee to the Banner mine.

The owners of the Fall River mine, near [illegible] Valley, project putting in ten new stamps.

Oroville hears that the Magnolia mine is to be reopened. F. B. [illegible] of Colorado is reported looking for an opportunity to purchase the mining property for Eastern men.

CALAVERAS COUNTY.

C. W. Howard, Supt. of the P. & C. Co., has a new air compressor at the mine in [illegible].

A chlorination plant is to be built for the Lightner M. Co., near Angels.

In the Jenny Lind district the State creek mill is running a few hours a day, owing to shortage of water.

The Golden Eagle mine, Dolan & Epperson, Milton, is down 50 feet on pay quartz.

The Lost Dog is to be shut down to take out the old machinery, to be replaced by that of larger capacity. The shaft will be sunk 200 feet deeper.

The Bonnie Blue Bell M. & M. Co. has been incorporated at Stockton, 200,000 shares, $1 each; $120,000 subscribed. G. W. Patterson, M. S. Thresher, G. A. Baird, I. W. Howard, J. P. Mosher.

W. T. Hayes is trying to incorporate at Mokelumne Hill, on a co-operative plan, to develop the Sparrow Hawk mine, on Esperanza creek. He thinks that with a 20-stamp mill the cost of mining and milling the ore would not exceed $1.25 per ton.

In the Ritter mine, near El Dorado, a tunnel being run on the vein is about 400 feet in, 192 feet below the croppings. It is to be extended to cut the old shaft.

EL DORADO COUNTY.

The Lone Jack mine, near Garden Valley, has been sold by the Sheriff to T. A. Geogh of San Francisco, to satisfy a judgment for the sum of $1254.38.

At the Larkin mine, Diamond district, the shaft is 700 feet deep. Sinking will be continued to 800 feet.

At the Mount Hope mine, near Grizzly Flat, the lower or main tunnel has been driven 800 feet.

The tunnel at the Electric mine, near Georgetown, is in 700 feet.

Fifty men are employed at the Mammoth Bar river claim, on the middle fork of the American river below Pilot Hill.

A new incline shaft is being put down at the Minnehaha mine, near El Dorado.

FRESNO COUNTY.

At Fresno it is reported that the Haskell group of copper mines, owned by H. B. Vercoe & Son, has been sold to an English organization.

INYO COUNTY.

The manager of the Tuba mines, near Ballarat, tells the Register that work on them is down 200 feet, with 12,000 tons ore blocked out.

KERN COUNTY.

The Blue Chief M. Co. has incorporated at Bakersfield: W. James, T. C. Minzer, H. I. Tupman, F. A. Brown, R. A. Edmons; capital stock, $100,000; subscribed, $50.

MADERA COUNTY.

J. A. Greenwood of the Questo C. M. Co. says a big flow of water necessitated the installation of a steam pump. Sinking has been resumed.

MARIPOSA COUNTY.

Mariposan: At the Mariposa mine the shaft is down 650 feet; sinking has been stopped and the east and west drifts started.

MONO COUNTY.

A. C. Pratt, at Par Value mine, 18 miles west of Bridgeport, has a twenty-ton stamp mill, with water power, rock breaker, concentrator, etc.

NAPA COUNTY.

The Napa [illegible] Co. has incorporated at St. Helena: [illegible], A. K. [illegible], J. W. [illegible], R. A. [illegible]; capital stock, $1,000,000; subscribed, $[illegible].

NEVADA COUNTY.

The [illegible] M. Co. has levied an assessment of 25 cents per share, delinquent Sept. 22.

At a meeting of the [illegible] M. Co. C. [illegible] was reappointed Supt. During the past year two tunnels have been driven—the upper one 200 feet from the surface, [illegible] feet. There there is a ledge 24 feet thick. The lower tunnel [illegible] 22 feet [illegible] 200 feet from the [illegible].

Herald: W. A. Fagerburg, resident engineer South Yuba Water Co., [illegible] work at [illegible]. In the [illegible] a large section of [illegible] flume was swept away. [illegible] the damage was repaired, Mr. Fagerburg with forty men building 600 feet of flume 6 feet wide and 3 feet high.

PLACER COUNTY.

D. T. Callahan of San Francisco has bought the [illegible] gravel mine, comprising about 400 acres [illegible], on the Forest Hill divide, 3 miles northwest of Forest Hill, for $35,000. It is a channel mine with 1000 feet of tunnel through gravel, with [illegible] breast at the face in good ore. The new owner is building a 10-stamp mill and expects to crush gravel by Sept. 1. R. E. Stephens will superintend the work.

J. A. Johnston and associates are locally reported to have sold the [illegible] claim, near Forest Hill, for $35,000. It is a gravel mine and is supposed to be on the same channel as the Mayflower.

F. Nicholls is superintending a project to work tailings in the North Fork of American river by the use of [illegible]. A dam will be built three-fourths of a mile below [illegible] bridge.

Colfax Sentinel: The California quartz mine, at Ophir, is being developed by Messrs. Bree, Lozano, [illegible] and Smith. The main tunnel is in 300 feet.—Development work is progressing at the Southern Cross quartz mine, on the North Fork of the American river near Towle. The main tunnel is 40 feet below the river and is now in 700 feet. Supt. S. J. [illegible] has twenty-two men employed.—Diego McGarey & [illegible] of San Francisco have a year's bond on quartz mines on the American river southeast of Cisco, Fairview, Daisy and Everett. A tunnel is begun in the mountain side that will give 1500 feet of backs.—Paying gravel has been struck in the Gleeson placer mine, near Iowa Hill. Recently one pan yielded $107.30. The tunnel is in 600 feet, about half of it being through bedrock.

PLUMAS COUNTY.

Near Greenville, at the New York, owned by the [illegible] estate, the 5-stamp mill, operated by steam power, is crushing ore said to run $15 per ton.

The McIntyre mill, ten stamps, has been moved from McClellan ravine to the [illegible] property.

Plumas National Bulletin: Wallace McGregor, mining engineer and metallurgist, is working the sulphurets which accumulated at the Plumas Eureka mine during several years, employing a modified cyanide process and meeting with success.—Near Johnsville at the [illegible] mine twenty stamps are running steadily. The mine is worked through a three-compartment shaft, two for hoisting and the third for pumping. The shaft is down 230 feet; 130 feet from the surface a drain tunnel connects with the shaft. The tunnel is nearly half a mile long. The water is pumped up from the bottom of the shaft 50 feet and discharged into the tunnel. The pump throws a continuous stream of water 10 inches in diameter, capacity 1300 gallons per minute. Of the twenty stamps the ten stamps in the upper part of the mill each weigh 850 pounds. The second ten, added last year, weigh 1000 pounds each. All of them drop ninety-eight times per minute. The mill crushes about sixty tons per day. By crushing the ore fine better results are obtained. Outside amalgamation is used. About 1000 pounds of sulphurets are saved daily and shipped to the Selby Reduction Works. From each carload of ore from the different working faces in the mine a sample is taken. These are assayed and the value of the ore from each face thus determined. As each carload of ore reaches the top of the shaft another sample is taken and all combined. This combined sample is assayed, giving the average value of the ore taken from the entire mine, also affording a check on the mill battery samples. Samples are taken from the battery every hour. The tailings are sampled at the same time as they leave the plates, also after having passed over the concentrators. By assaying these samples it is learned just what percentage of the gold the mill is saving. [illegible]. The storage capacity of the [illegible] is [illegible] acre-feet, covering about 400 acres.

RIVERSIDE COUNTY.

The [illegible] mine and mill are running [illegible]. The last clean-up was $2080, netting $1630.

At the [illegible] Queen [illegible] the [illegible] mine [illegible].

The Good Hope mill is temporarily shut down.

The Santa Rosa mine and mill, under bond to an English syndicate, has changed hands.

SACRAMENTO COUNTY.

At the Blue Ravine mine the new [illegible] compartment shaft will be commenced [illegible].

[illegible] when the water is lowered sufficiently [illegible] will be put in.

SAN BERNARDINO COUNTY.

The State Supreme Court has rendered a decision of importance to miners and prospectors. J. Kahn brought suit against [illegible] & [illegible], [illegible] his assessment right to the [illegible] quartz mine. [illegible] alleged a failure on the part of Kahn to perform the necessary amount of work required by law [illegible]. The lower court held that the work performed [illegible]. The Supreme Court reverses the decision. It says that the court should not substitute its own judgment and wisdom as to the best methods of developing the mine in place of that of the owner. The Supreme Court holds that the tunneling [illegible] to develop both mines, and the cost of the work being far in excess of what is required by law and the work being in progress at the time of the [illegible], it can not be said that the original location had been abandoned.

SAN DIEGO COUNTY.

W. S. [illegible] and [illegible], interested in the [illegible] iron mines, Lower California, tell San Diegans that a furnace is to be built in San Diego to smelt 300 tons of ore by the [illegible] process.

The Golden Cross, at Hedges, is one of several mines in a belt, [illegible], composed of [illegible], which shows itself on the surface in [illegible]. The gold is found in the [illegible]. Six miles north of the Golden Cross is the [illegible] mine, now [illegible], owned by ex-Governor [illegible], who has [illegible].

The [illegible] of the [illegible] Co., [illegible], general manager, is down 420 feet. [illegible] has been reached.

SAN FRANCISCO COUNTY.

The [illegible] Co. has incorporated: [illegible]; capital stock, $100,000; subscribed, $500.

The [illegible] Co. has incorporated: [illegible]; capital stock, $500,000; subscribed, $50.

SHASTA COUNTY.

W. S. [illegible] is sending miners and mill men from [illegible] to the [illegible] mine, of which [illegible] is Supt.

[illegible] is running a new tunnel on the [illegible]; [illegible] tunnel work is being pushed.—One of the most important mining deals in this county [illegible] the group of claims on the divide between [illegible] creek and South Fork, which has been bonded by S. W. [illegible], representing

ing a company at Lawrence, Mass.——A tunnel will be started on the Lewis claim Oct. 10th and extended into the mountain 3000 feet, cutting the old Chicago mine at a depth of 700 feet.

SIERRA COUNTY.

The Thistle Shaft Co. has, for two years, been boring holes on their property, near Gibsonville, to determine the depth of the gravel channel to tap it by a tunnel.

Packer & Son are engaged operating their mine on Slate creek, near La. Porte. They have twenty-six men in their employ.

The Ne Plus Ultra, owned by Gibsonville men, is bonded to Mr. Bullock, who is driving a tunnel in the dividing ridge between Slate creek and the south fork of Feather river, near Newark. The tunnel is in 3000 feet. The pay channel is expected to be reached in 1000 feet more.

SISKIYOU COUNTY.

In the French Gulch mining district is reported the prospective sale of the New Brunswick mine by F. Rossi to Colorado men for $30,000.

Roberts & Jillson have ten men at work on the Gladstone.

The Searchlight says the American mine, owned by Baker & Hamilton, will resume work with the 10-stamp mill.

At the Brown Bear Supt. Dobler is proceeding with the construction of the new mill.

STANISLAUS COUNTY.

The Stanislaus M. & P. Co. has the machinery for its plant at Knights Ferry.

TRINITY COUNTY.

C. D. Galvin of the Shasta King mine is successfully operating a Keystone driller on Weaver creek. It is thought a dredger will be put in.

G. E. Bailey, Supt. Adele Co., Lewiston, has a new mill breaking up cemented gravel and saving free gold and handling the black sand. The material is fed from an ore bin into a revolving hexagon of steel bars, broken up and the boulders washed clean, the latter falling into a car that carries them to the dump. The cement, gold and black sands pass through the grate bars onto a table of riffles, with a rapid side shake bringing the gold into contact with the mercury in the riffles. After leaving the table the pulp passes through a revolving screen that separates the coarser from the black sands. The black sands pass on to a moving carpet table, which cleanses them so that they can be shipped to the smelter. The plant has a capacity of ten tons of gravel per hour.

TUOLUMNE COUNTY.

The Magnet hears that the Utica M. Co.'s electric line is to be extended from Murphys to Carters. The owners of the Utica also own the Eureka Con. (Deadhorse) mine near Carters.

The railway track has been completed from Jamestown to Tuttletown. Work has begun on the cable tramway that will connect Tuttletown with Carson Hill.

The Boston & Tuolumne M. Co. at Big Oak Flat has resumed operations. P. Loeffler is Supt.

There has been placed on record a transfer from the Santa Ysabel G. M. Co. of Wyoming to the Santa Ysabel G. M. Co. of Colorado the following mining properties: Miller & Holmes, Knox & Boyle mill and mill site, Grey Eagle quartz mine and mill site, Wyman consolidated quartz mine, and eighty acres of adjoining land. Consideration $70,000. The properties lie between Stent and Quartz.

Soulsbyville reports the discovery of a parallel vein in the Black Oak mine. The shaft recently reached a depth of 1000 feet. At 60 feet in a drift north of the shaft to reach the ore shoot that had been uncovered in the drifts above a 6-foot drill was started in the foot wall, and before it had reached its length was found to be in high-grade quartz. A crosscut opened a ledge 10 feet wide. Assays show lowest value ore $40, highest $70.

Independent: At the Crystalline opertions will commence at once with steam power.——Advantage will be taken at the Republican mine of the "no water" season in extensive and needed improvements on the property.——The mill at the Rawhide mine is closed owing to lack of water, the working force reduced from eighty to twenty. The latter will be retained to retimber and sink the main shaft from the 1900 to the 2300-foot level.——Supt. F. F. Restano at the Golden West has new ore discovery in a ledge 4 feet wide. The tunnel is being retimbered, new cars, airs and water pipes, 2000 feet steel rail are being put in.

Jamestown Magnet: The power house at Phœnix lake is shut down for the season, the water supply in the Tuolumne Water Co.'s reservoirs being exhausted. This necessitates the closing down of many mines altogether and the reduction of the working force in others. Including the employes let out during the past month by mines employing small crews, 600 men who work in either mine or mill find themselves out of employment temporarily by the giving out of the water supply.——At the Jumper Syndicate's mines about thirty-five men have been drafted, principally at the Golden Rule mine. They have hung up twenty stamps in the Jumper mill. It is the intention of the superintendent to keep forty stamps in operation as long as they have battery water, using their own electric power and steam to operate by.——At the App Con. Co.'s properties about forty men are retained, some sixty being let out. This company had everything in readiness for the shut-down. At the Rawhide they have commenced retimbering the shaft. When this is finished, sinking below the 1700 level will be resumed.——At the Harvard the force has been reduced from sixty-five to sixteen men, who are doing development work at 5 and 7 levels.——The Black Oak people will continue to operate their 30-stamp mill right along, using steam power.——On the cessation of the water supply, the Dutch mine closed down entirely, in the absence of Supt. Trittenbach. On his return, he stated that ten stamps will be kept in operation as long as the battery water lasts. About fifteen men will be employed about the mine.——About forty men were laid off at the Golden Gate mine, only sixteen being retained. The chlorination works at this property are still in operation.——Seventy men were laid off at the Eagle–Shawmut mine as a result of the giving out of the water supply and closing down of the mill. About forty men are kept on. During the shut-down the mill will be overhauled and some changes made.

COLORADO.

BOULDER COUNTY.

At the Lucky Star R. A. Duncan reports that in sinking 100 feet enough ore was taken out to pay $2500 over the expenses of the work.

CLEAR CREEK COUNTY.

Georgetown reports that the Doric gold mine has started up again and will be worked under the management of an English expert, who has been sent over here to take charge of the development work by the London shareholders.

An extensive power plant is being introduced at the Griffith mine by the Annetta Co.

The Sedgwick mine, on Covode mountain, is reported to yield values of $35 per ton in gold, silver and copper. A. Harley, one of the principal owners, is in charge of operations.

The Silver Glance mine, Democrat mountain, is under bond and lease to G. Berg & Co., with whom is associated J. H. Robeson, manager Pelican Dives and Seven-Thirty mines at Silver Plume.

B. F. Kelly, at Georgetown, has a tunnel scheme. The idea is to run straight into Democrat mountain 6000 feet, cutting in its course many lodes. The first vein will be cut within 300 feet of the mouth of the tunnel, and it is locally calculated that from that point on there is scarcely 100 feet on the line that is not cut by a vein. The ore first encountered is gold, silver and lead, running about $8 in gold, fifteen ounces in silver and a percentage of lead. Near the proposed terminus of the tunnel the ore is high grade silver, many of the mines having ore which runs 400 ounces a ton. The advantage to these silver mines is that, owing to the decayed condition of their workings, new shafts are inoperative if worked from the surface, and the tunnel can be run the entire 6000 feet about as cheaply as a single shaft can be sunk to the depth of the tunnel. A feature of the contract with the property owners is that, if for any reason they do not see fit to work veins on their property that may be cut by the tunnel, Mr. Kelly has the right to work these veins on a five-year lease. In connection with the tunnel scheme it is the intention of Mr. Kelly to construct a mill at the mouth of the tunnel for the treatment of the low grade ores that may be encountered. This enterprise will not be started until the tunnel has cut a sufficient number of ore bodies to guarantee a sufficient supply of ore for a large plant.

The Wilcox tunnel, owned by the Miami M. & M. Co., has been sold to the Big Five M. Co.; W. D. Daniels, Denver, president. The tunnel is now in 2200 feet, and will cut Quartz hill at 2000 feet depth, perpendicular measurement. The Big Five Co. has also bought the Turner water right on Clear creek.

The Monarch M. M. T. T. & P. Co. have bought the Freeland mine and about sixty other claims, and a tunnel site from Clear creek through Trail and Banner mining districts to the Freeland.

The Newhouse tunnel is progressing at the rate of 200 feet per month, and is now in to Old Seaton, over 10,000 feet, with about the same distance to go. The tunnel is 12x12; its destination is the 1900-foot level of the California mine at Nevadaville. The company has acquired the available land opposite the tunnel, lately owned by Hall & Co.

GILPIN COUNTY.

At the new mill at Blackhawk of the Boston & Denver M. & M. Co., the eighty stamps are crushing ore from the Cook, Ridgewood and Gregory properties. An electric motor hauls the ores from the Cook mine to the mill, which is handling 300 tons every twenty-four hours.

An option on the East Notaway mine has been given by Sheriff Mitchell to the proposed purchasers for six months, at the end of which time they are to pay $25,000 and assume the payment of the bond, which calls for $25,000 more in two years.

At the Saratoga mine forty men are employed.

The Kokomo is shipping ore to the Rocky Mountain mill at Black Hawk.

The 76 G. M. & M. Co., through L. E. Curtis, has sold the First Centennial mining property, in Chase gulch, to the Imperial G. M. Co. for $50,000.

GRAND COUNTY.

The Gilsonite Co. are opening deposits at the head of Willow creek. They find a ready market at a good price.

GUNNISON COUNTY.

Spencer reports that the owners of the Gunnison and Standard mines will soon resume.

At Midway the Dale Co. is at work.

At the Elko mill J. P. Smith is in charge, putting in tables of his own invention for concentration.

There is prospect of a smelter at Gunnison City. Citizens have raised $10,000 bonus and donated fifty acres of land, on which are the remains of the old smelter. The Colorado & Southern Railway offer to haul ore for $1 per ton anywhere on their line from the line of the range to the smelter.

LAKE COUNTY.

The Yak tunnel is to be driven to the Forest Queen property, on the summit of Breece hill.

Leadville is to have a mining stock association.

The Penn mines are reported shipping 300 tons a day of siliceous ore carrying bimetallic values.

The Miner says the bad air is being drawn out of the Hummer shaft. In the upper level are streaks of lead ore and large bodies of siliceous ore. It is impossible to carry a candle away from the shaft in the bottom level; but the air pipes have been extended 100 feet into this level, and it will soon be cleared to this point.

PARK COUNTY.

(Special Correspondence).—The Boston G. M. & M. Co., at Black mountain, are pushing work on their Boston tunnel, designed to cross all formations at a depth of 700 feet, and will be driven 1500 feet into Hammond's Peak, with intent to tap a body of low-grade sulphides in No. 5 shaft. An air compressor and machine drills will be installed next month. The property is managed by D. G. Jewett. The tunnel is now in 120 feet. Seven men are at present employed.

Guffey, Aug. 20.

PITKIN COUNTY.

During the year ending July 1 the Argentum–Juniata, at Aspen, produced 48.287 tons, net weight, of regular (shipping) ores, netting $1580.73; 6990.093 tons, net weight, of lease ores, netting $63,384.67; 38,259 tons, gross weight, milling ores, which produced concentrates netting $151,672.56; aggregate net smelter returns for the year, $216,637.96. The average gross value of the ore milled during the year was $7.36 per ton gross, in the mine. For the timbering of stoped ground, development workings, and in timbering repairs, about 500,000 feet B. M. of timber was used during the year, largely in the form of framed sets. The company received $14,344.59 in royalties and charges on lease ores, 22.63% of the net cash returns for lease shipments. The company paid out on these ores, as royalties to lessees, $2287.41, leaving $12,057.81 net income for the year from leased ground.

PUEBLO COUNTY.

J. R. Gorden, register of the Pueblo land office, says that for the first half of 1900 the number of mineral applications show an increase of 33⅓% over the corresponding period of 1899. During July there were forty-four applications for patents.

SAN MIGUEL COUNTY.

(Special Correspondence).—The Butterfly mine and mill and the Terrible mine are now operated by the Butterfly-Terrible M. Co., of which C. Bullock is president, K. Benson vice-president, F. J. Hobbs secretary and D. J. Sayer manager. The upper workings of the mine are at an elevation 1000 feet higher than the mill, a wire rope tramway, 1300 feet in length, connecting the lower Butterfly tunnel with the mill. An upper, intermediate and lower tunnel, crosscutting the formation a distance of 2100, 1010 and 1010 feet, respectively, open three veins—the Butterfly, Ida and Terrible. On the last named vein a vertical shaft sinks 643 feet from the surface, from the base of which a 145-foot crosscut connects with the upper tunnel. The workings on the group aggregate nearly 9000 feet. The ores from the Terrible vein consist of a sulphide, carrying good values in silver and lead. The Butterfly and Ida veins carry a gold bearing ore, which is quite free milling. The mill of thirty stamps and nine Frue vanners is operated by a 6-foot Pelton water wheel; to run the latter two flumes converge at the mill—one conveying water from Lake fork and the other from Wilson creek. Only twenty stamps are now dropping and one vanner is idle. The ore being milled, which in the main comes from the Butterfly and Ida veins, runs from $9 to $10 per ton. Of the values saved about 80% are obtained on the amalgam plates.

Ames, Aug. 24.

(Special Correspondence). — The San Juan G. M. Co. of Milwaukee, Wis., operates the Bessie mine and mill in Alta basin at between 11,000 and 12,000 feet altitude, situated between Telluride and Ophir. The mine is opened through a main tunnel, running northward 1600 feet, which affords access to two north and south veins and two veins trending east and west. The Bessie and Sioux veins, running north and south, are opened by about 1700 feet of drifting, with some stoping. The Montezuma and Baldy veins, trending east and west, are developed by nearly 2000 feet of drifting, with several upraises for stoping. These veins vary in width—perhaps 2 feet would be an average. The ore is siliceous, with very little sulphides, and carries gold and silver. It is conveyed to the mill over a 4200-foot Finlayson tramway line, having twenty-two buckets of 410 pounds capacity each. An electric motor at the mill terminal attaches to the tramway machinery to steady its motion and to stop and start it promptly.

The mill machinery is operated by an electric motor. The ore passes through crushers to two sets 1½-mesh rolls, thence is elevated to automatic sampler, dropping then into ore bins. From the bins the material is fed to an Argall cylindrical drier, thence elevated to three sets of rolls, which grind to 2-mesh, 6-mesh and 10-mesh, respectively. From the rolls it passes through a series of seven revolving screens, graduated to different sizes, the very fine being screened off and carried to the pulp bins by a suction fan, the coarse being returned to the rolls for regrinding. Lime is mixed with the material before grinding to counteract the effect of acid in the ore. The ore, in this finely pulverized condition, is dropped from the pulp bins into cars, by which it is carried to leaching tanks where cyanide solution is applied. There are six leaching tanks, each of 150 tons capacity. A weak solution is forced into the tanks from below by pressure from the storage tanks. After twenty-four hours a strong solution is applied on top of the material in tank, allowing it to percolate through. The solution is then drawn off to the zinc boxes by a vacuum pump.

The zinc slimes, carrying the values, are subjected to the sulphuric acid bath, by which the zinc is dissolved, leaving the gold and silver in precipitate form, the latter being dried, put into crucibles and smelted. Some loss is said to be entailed in the form of coarse gold, which fails to dissolve in the cyanide. To recover it riffles are being put in the sluiceway, through which the refuse is washed down. The mill capacity is about 200 tons per day, though only about 75 tons are being run at present.

The Alta mine is producing about thirty-five tons of ore per day, about thirty tons of this being concentrated at the Gold King mill, the balance being shipped to the smelter. An account of the development of this property appeared in the MINING AND SCIENTIFIC PRESS of the issue of Aug. 11, 1900.

The Gold King mill has forty stamps. Ten of them, with concentrators, operate on Alta ore; the other thirty operate on Gold King ore, which is strictly free-milling, a very close saving being made on the plates. About fifty tons of Gold King ore per day are milled, which averages close to $20 per ton. The latter mine is worked by lessees, to whom the ground is blocked out by the company's manager.

Alta Basin, Aug. 24. WASCOTT.

(Special Correspondence).—The Crown Point lode, on the north side of Ophir canyon, is being worked under lease to Geo. Rohmer, who is shipping about thirty tons of ore per month to the Durango smelter. The main values in the ore are gold and silver, carried in an iron and manganese base, the smelters allowing about $2 per ton for the manganese, bringing up the entire value to an average of $20 per ton. Packing the ore to the railroad and freight to Durango costs him $4.25 per ton.

The Suffolk mine and mill are being operated this year by the Suffolk Co., under the management of W. J. Scoutt. The mill is not running full capacity, putting through only about 100 tons of ore per month, which, however, is high grade, the saving being on the plates and in concentrates.

The Statsbury, located in Statsbury basin, belongs to New York parties, who are developing the property. Recently a test run of their ore was made at Suffolk mill.

The Deadwood and Nevada group of seven claims, located on the northern slope of Yellow mountain, is in control of the Milwaukee-Ophir M. Co., of which Geo. R. Dolf is manager. This company has a bond and lease on the old Nevada lode and have acquired the claims covering the Deadwood and Mt. Vernon veins and the Deadwood tunnel site. The Nevada lode was extensively worked in earlier days. It trends northeast and southwest and was opened through three crosscut levels, 60 to 100 feet apart, drifts on the vein at each level having been run several hundred feet and the ore stoped out between levels and to the surface. In these old workings the vein is said to have been from 4 to 5 feet wide. The ore on this lode is a lead and copper sulphide, carrying gold, silver and lead values. Present efforts of the company are exerted in driving the Deadwood tunnel to cut the Nevada lode at a point nearly 1000 feet below the old workings and at a horizontal depth of 1950 feet from the entrance. The work has progressed 950 feet, the tunnel being 4½x7 feet, with a drainage flume below the trackage. This tunnel cuts through the Mt. Vernon vein at 175 feet and the Deadwood vein at 400 feet from the entrance. This company is a close corporation, made up largely of Milwaukee people.

The Suffolk cyanide plant, under the management of W. E. Bennett, has just started operating on a dump of 20,000 tons of tailings impounded from the Suffolk mill, which, Mr. Bennett thinks, runs from $3 to $30 per ton. The present plant has a capacity of twenty tons per day. If the first run of thirty days prove as successful as anticipated the plant is to be enlarged to fifty tons capacity. The cyanide solution is first forced upward through the tank of tailings by pressure, and afterwards poured in at the top. The zinc precipitating boxes are so constructed as to draw off the gold slimes at the bottom.

The Carribeau concentrating mill runs steadily with ten stamps and four tables, there being no amalgamating plates. About twenty-five tons of ore per day are reduced to five and six tons of concentrate. The values are gold, silver and lead, carried in a copper, iron and lead sulphide. The tailings from this mill are being impounded. WASCOTT.

Ophir, Aug. 25.

(Special Correspondence).—The Telluride Power Co. has commenced the construction of an electric power plant near this place, which will be practically a duplicate of their plant at Ames. The generators at the new plant will be run by water power, to supply which about 6 miles of pipe line will be laid.

Vance Junction, Aug. 25.

The Butterfly-Terrible mine, at Ophir, for the three months ending Aug. 1 produced $15,946.43, the ore running $18 per ton in gold and silver. The vein is vertical. The average output is about forty tons per day. The company is also engaged in development work.

SUMMIT COUNTY.

At Kokomo Mr. Robertson has a lease and bond on the Robert Emmett in Mayflower gulch.

The El Dorado mine, Robinson, is shipping ore.

The Rattler is taking out ore which runs 600 ounces silver per ton.

TELLER COUNTY.

At the Independence mine Supt. Stark has resigned. Two foremen have been discharged and replaced with men from Silver Plume. The duties of Supt. will for a time be discharged by H. A. Shipman, resident manager. Mr. Stark will take the general superintendency of the John A. Logan and American Eagles; W. S. Stratton owner, Mr. Emerson manager.

The Union G. M. Co. has sold its Bull hill properties for $350,000.

The Six Points G. M. Co. has sold the Six Points claim to F. Rawley for $120,000. A meeting of the stockholders has been called for ratification September 4th.

The Moon-Anchor Con. G. M., Ltd., of London will meet on the 22nd inst. to increase the capitalization from $600,000 to $1,250,000, divided into 1,250,000 shares, par value of $1 each. The new company expects to start with about 250,000 shares and $100,000 cash. The reorganized Moon-Anchor Co. will own the present holdings on Gold hill, the Zeolite and Bloomington lodes on the east side of Battle mountain and the Surplus fraction. The officers believe that they will find their ore bodies richer and permanent when granite is reached, which is supposed to be between 100 and 200 feet deeper.

IDAHO.

The values of mines and mining improvements, as given by the County Assessors, are as follows.

County.	Value.
Bingham	$4,000
Blaine	88,250
Boise	115,119
Cassia	1,625
Elmore	85,000
Idaho	61,720
Kootenai	12,000
Lincoln	4,950
Owyhee	234,200
Shoshone	592,350
Washington	14,997
Total	$1,214,211

The number of quartz mills is 79, of which Boise has 19, Elmore 17, Idaho 11, Kootenai 1, Owyhee 14 and Shoshone 17; of concentrators Idaho has 6, Kootenai 1 and Shoshone 16. Shoshone reports 1 sampler and Washington 2 smelters.

BLAINE COUNTY.

Near Hailey, C. W. Courtney, Supt. Liberal and Maggie May group of twelve claims, Little Smoky district, has a vein 18 feet wide, ore assaying $8.

The Hailey Times says the Jumbo group of mines has passed into the hands of men who are able and willing to develop it. It has been purchased by D. Mackenzie of Burlington, Vt., and H. L. Hollister of Boston, who have associated themselves with men of Scranton, Pa., and organized a close corporation; capital stock, $250,000; merely for convenience, as there are no shares for sale.

BOISE COUNTY.

The Statesman says that the Elkhorn mine is practically sold to S. Gundaker and associates for $17,000, although the deal has not been definitely closed, as Mr. Gundaker's bond still has about six months to run.

H. Edlin, who has been Supt. Iowa mine for the War Eagle Con. Co. at Quartzburg, has turned over the works to his successor, Mr. Du Forrest of Denver. He says there is plenty of ore in sight; it is of good paying quality.

OWYHEE COUNTY.

Mining is to be resumed at the Cumberland. The new machinery is all in.

SHOSHONE COUNTY.

At Burke the Hecla M. Co. has declared a dividend of $20,000. Two years ago this property was but a prospect; shares went begging, 5000 being at one time transferred to satisfy a bar bill.

The new tunnel at the Custer is to be 3000 feet; it was started 800 feet above the level of the creek, is now in 2000 feet and 700 feet more will carry the work to a point below the old workings with an increased depth of fully 1000 feet. Some rock from the face of the tunnel shows sulphurets and concentrating galena.

Osborn reports Blake Bros. shipping ore from the Yankee group on Big creek, rich galena yielding average amount of lead and 150 ounces silver to the ton.

MICHIGAN.

HOUGHTON COUNTY.

No. 7 shaft at the Quincy mine is timbered to the bottom, a depth of 4300 feet. No. 8 shaft is down 500 feet. The Quincy's compressors can furnish power to 225 drills. Next month the new stamp mill will be ready to crush 3000 tons of rock daily. A pipe line a mile long is being laid to furnish power from No. 6 shaft compressor plant to No. 8 shaft. The new engine at No. 7 shaft of the Quincy is capable of working to a depth of 8000 feet.

MONTANA.

CASCADE COUNTY.

Near Neihart the Hegener mine has sunk a two-compartment shaft, vertical the first 30 feet, inclining below 157 feet. The ledge contains galena, copper pyrites and brittle silver.

GRANITE COUNTY.

The new electric power plant of the Granite Bimetallic Con. M. Co., at Flint Creek Falls, constructed at a cost of $100,000, is in successful operation, thereby largely reducing expenses, heretofore a retarding influence in the financial operation of that corporation. P. A. Fusz, president and present manager, and Mr. Porter of the Hope M. Co. are at Philipsburg.

JEFFERSON COUNTY.

The Belle mine at Wickes has been leased and bonded to Church, Sutton & Hermann.

LEWIS AND CLARKE COUNTY.

A Helena special says: "Thieves stole $5000 worth of gold from the assay office of the Jay Gould cyanide plant. The gold was in a retort and represented a two weeks' clean-up of R. A. Harsh's cyanide mill. The amalgam was red hot when taken from the office, having just come from the furnace."

F. A. Heinze has taken a lease and bond on the Barden copper property, near Helena, for $25,000. A shaft is to be sunk 500 feet.

MADISON COUNTY.

The Pony Sentinel says A. W. Tanner of Red Bluff has commenced work again on his Pole creek placers. He did not commence work where the expert placer miner of Toronto left off, but intends to leave the latter's work as a monument to the stupidity of a company in sending a tenderfoot to take charge of a mammoth enterprise. W. Tarleton is now foreman for Mr. Tanner.

At the Red Bluff mine is a new gallows-frame that cost about $4000. A 60-ton concentrator will be erected.

At the Red Chief excavating for a 30-ton concentrator is pushed. The crusher will be a Griffin three-roller centrifugal mill, with plates; the concentrators used will be Wilfley tables.

E. W. Riggs is operating the South Fork mine, on Mill creek, near Sheridan. Development consists of a shaft 320 feet in depth and a 225-foot tunnel. The ore averages $25 a ton.

NEVADA.

DOUGLAS COUNTY.

The Little Bonanza mine, at Delphia, is now running with an output of twelve tons of rock per day from a 5-stamp quadruple discharge mill.

ELKO COUNTY.

All the stock of J. S. Lakin in the properties of the Dexter & Tuscarora G. M. Co. at Tuscarora is sold to Col. S. B. Milner for $120,000.

LINCOLN COUNTY.

A Boston company, F. W. Dunn local manager, is completing its 20-stamp mill at Searchlight. El Dorado canyon is to have a 50-stamp mill.

STOREY COUNTY.

A consolidation of Comstock mining interests under one management is projected.

NEW MEXICO.

GRANT COUNTY.

The Hanover Co. has bought the Emma property at Fierro. A steam hoist has been erected, a pump put in operation and timbers are being framed for the shaft, which will be sunk considerably deeper.

W. H. Seamon has visited the Dundee mine, Lordsburg district, owned by the Orion M. Co., headquarters El Paso; report indicates minimum width of vein 10 inches, maximum 30 inches; ore averages $3.50 silver, $3.20 gold and $7.20 copper.

The Mineral Mountain M. Co., Chicago, S. S. Winn manager, is reopening five claims 3 miles from Stein's Pass.

OREGON.

CURRY COUNTY.

J. B. Burns, operating a quartz mine on Mule mountain, wants a 5-stamp mill, as he thinks he is throwing away $40 a ton.

GRANT COUNTY.

At Granite the Magnolia and Little Giant mills, idle since January, are to be started up. Manager Bley of London, who represents the English owners, is at Granite. The claims against the Little Giant Co., exclusive of the unpaid portion of the purchase price on the Magnolia, aggregate $11,000. There is still due $25,000 on the Magnolia.

JOSEPHINE COUNTY.

W. E. McMartin, vice-president Big Yank M. & M. Co., is in San Francisco regarding the bonding of the property in Galice mining district. The ledge has been cut at a depth of 100 feet by a crosscut tunnel, which exposes a streak carrying copper and gold.

The strike in copper made by H. C. Booth is on Little Pickett creek, near Merlin. There are two parallel veins. The assays give a return of $12 per ton in gold and 19% copper.

The 12-mile wagon road recently constructed at a cost of $19,000 by the Goldbug M. Co., from Glendale to the Goldbug mines, Mt. Reuben, has been made a toll road.

The ore shoot in the Ashland at the 425-foot level is 170 feet long. The shaft is down 575 feet. Twenty-five men are at work. B. Carlisle is Supt., with General Manager Ingersoll.

UNION COUNTY.

Manager N. J. Jenkins at the Gem mine, near Sparta, says a depth of 460 feet has been attained and levels run 450, 350 and 300 feet in depth. An upraise from the 450 to the 350 foot level is being driven for air. A contract has been let to sink a prospect shaft 300 feet south of all previous workings. Ore bodies are being exposed.

TEXAS.

BURNET COUNTY.

The White Eagle M. Co. at Burnet will send three cars of their ore to Denver to test the different processes of treatment of their ores. They claim to have a vein from 20 feet to 60 feet, which shows values all the way from 8% to 30% copper, and from $3 to $10 gold. It is expected that a plant will be erected by the company to treat its own ores.

UTAH.

JUAB COUNTY.

At Eureka twenty-five men at the Bullion-Beck mine have been drafted.

The Alaska mine shaft at Silver City will be sunk much deeper, and a pumping plant will be put in.

SALT LAKE COUNTY.

It is now inferred in Salt Lake City that the A. S. & R. Co. has modified its plans, and instead of putting up a new million dollar smelter it proposes to put up a $300,000 addition to the Germania smelter.

SEVIER COUNTY.

Near Richfield C. E. Watkins, general manager Boston Placer M. Co., is working gold-bearing bars on the Colorado river. He thinks he has discovered "the long-lost Spanish mine," 25 miles northwest of Richfield. When found the mouth of the shaft was almost covered over with masonry. The shaft is perpendicular 30 feet, then inclines for 25 feet, perpendicular again for some distance, inclines again, and so on. There are ten men at work. They have followed the opening 135 feet. The remains of drill holes indicate that the excavation was made by man. Thousands of stalactites that hang from the walls show that ages have passed since the work was done.

TOOELE COUNTY.

The output of the Con. Mercur gold mines has reached a daily average of nearly 1200 tons of ore on a net valuation of $4 per ton. Its present earnings are in the neighborhood of $140,000 per month. The capacity of the crushers is 2100 tons daily; the output will be increased.

WASHINGTON.

SPOKANE COUNTY.

At Spokane the mining department of the Exposition opens Oct. 2nd.

SNOHOMISH COUNTY.

The Bluebird mine, on Gold mountain, near Darrington, reports that the miners have a vein of chalcopyrite in the lower tunnel.

The Calumet, at Index, is again being operated; C. Osner is manager. The Calumet is a copper proposition principally, although there are some gold and silver values in the ores. The ore is a chalcopyrite, average 15%. The Calumet is 4 miles northeast of Index. The Calumet aerial tram, capable of transporting twenty tons per day, was completed last January, and cost $5000.

At Silverton the 45-tram will be cut in two at the summit, with a reloading station at that place.

At the Imperial Supt. Swinnerton is sacking ore.

WYOMING.

CARBON COUNTY.

The men buying the Ferris-Haggerty copper mine at Battle Lake for $2,000,000 telegraphed to learn if the death of President Ferris would delay negotiations. To obviate unnecessary delay the will of Mr. Ferris was filed Aug. 22d and the deal for the mine will be closed Sept. 15.

BRITISH COLUMBIA.

Grand Forks reports that the B. C. Co., Summit Camp, have bought the water power at Cascade. Power is being developed by the Cascade W. & L. Co. The falls are capable of developing 10,000 H. P.

J. P. Graves has a four-fifths interest in the R. Bell mine, Summit Camp; purchase price, $50,000.

In the portion of the Porcupine district, which the provisional boundary arrangement transfers from Alaska to Canada, are about half the placer mines of the district, which are in all yielding some $250,000 of gold per annum at the present. Henry Bratnober says there are gold quartz indications and valuable deposits of copper-gold. If the provisional boundary arrangement should be confirmed, British Columbia will receive an addition of new mining country, small in area, but apparently rich in gold and copper.

The fire loss at the Dundee concentrator at Ymir is set at $11,000.

A. Laidlaw of the Standard Copper Co. has bought a smelter site on Boundary creek, 3 miles below Greenwood. A plant for a 200-ton hot and cold blast standard pyritic smelter is under construction by the Denver Engineering Works Co. of Denver, Colo.

At Grand Forks the Granby smelter

was blown in on Aug. 21st. It has a daily capacity of 500 tons; water power will be used. The smelter will use 15,000 miners' inches under a head of 45 feet. The dam is 175 feet across the top, 75 feet from heel to toe on the bottom, built of 12x12-inch sawn timbers, filled in with rock. The flume is 12x6 feet—a mile long. Power was offered the Granby Co. from Bonnington falls, on the Kootenai river, for $75 per horse power per year, but the company will generate its own power.

A spur track 2½ miles long runs from the main line to the north end of the smelter works. The power house is 1000 feet from the smelter buildings and 100 feet below them. The main power with which the blowers, sampling works, etc., will be driven is to be created by a duplicate set of 16-inch turbine wheels operating under an effective head of 45 feet. These wheels are connected with the flume by a steel intake pipe 4 feet 7 inches in diameter. Both are directly connected with one Westinghouse rotating arm, alternating current generator. Another wheel is belted to a pump with a daily capacity of 750,000 gallons. The pump will furnish water and pressure to granulate the slag as it runs continuously from the furnaces.

The smelter consists of two double-decked, steel-jacketed furnaces, 160x44 inches. The gases pass off from the top in a 4-inch diameter down-take pipe, which is connected with the big flue dust chamber leading to the stack. The down-take of the furnaces is connected with the big flue chamber, 10x10 feet on the inside and 300 feet in length. The stack is 11x11 feet inside measurement and 150 feet high.

The blower room is 50x58 feet, and is 12 feet from the furnace building. It will contain three blowers—one for each furnace and one in reserve. These are connected with the furnace by a 54-inch diameter blast pipe, all blowers being connected with the one main pipe. Each of these blowers is driven by an 88 H. P. variable speed Westinghouse induction motor, belted directly to the blower.

The main sampler building is 64x70 feet, and is surrounded on three sides by ore bins. The ore train, as it comes into the smelter, will be carried by an incline to a series of receiving bins parallel to the front of the sampling works, 23 feet above the floor and 33 feet distant. These receiving bins will have a total capacity of 1000 tons. The bins are filled directly from the cars, which have a bottom dump.

It is intended that the matte shall be shipped after being brought up to 45% or 50% copper. For the present it will go to an Eastern refinery. This shipping matte, after having been cooled, will be crushed in one corner of the furnace building on the furnace floor. This crushed matte will be raised by an ordinary sub-elevator to a special matte sampler. This matte can be sampled automatically or by hand. The lower part contains four bins, holding about one car of matte, and it will contain the matte after it shall have been sampled.

When the works are enlarged it is proposed to put in a matte-converting plant complete and to ship converted copper. A roasting plant will also be installed. For the present, 50% of the ore will be roasted in piles. The treatment rate for custom work will not exceed $5.50 per ton.

GERMANY.

Consul-General Guenther of Frankfort writes: A statement compiled by the imperial statistical office of the mining and metallurgical production of Germany and Luxemburg in 1899 shows the production of some of the more important minerals and metals to have been as follows:

MINING PRODUCTION.

Articles.	Metric tons.*
Coal	101,621,866
Lignite	34,202,561
Iron ore	17,989,665
Zinc ore	664,536
Lead ore	144,370
Copper ore	733,619
METALLURGICAL PRODUCTION, ETC.	
Raw iron	8,117,594
Zinc, in block, etc	153,155
Lead, in block, etc	129,225
Copper, in block, etc	34,626
FURTHER MANUFACTURE OF RAW IRON.	
Cast iron of second fusion	1,720,443
WELDED IRON AND WELDED STEEL (SCHWEISSEISEN).	
Blooms and rails	78,904
Finished manufactures	1,103,740
CAST IRON AND CAST STEEL (FLUSSEISEN).	
Ingots	456,815
Blooms, billets, sheets, etc.	1,042,597
Finished manufactures	4,791,022

* 1 metric ton = 2204.6 pounds.

MEXICO.

Oasis: In the San Miguel country, 35 miles northwest of Pesqueira station, on the Sonora Railroad, is a scene of great activity. The Melzcer M. Co. is pushing development work upon the Copete mine; J. L. Giroux of the United Verde is working upon his Sultana property; Mills & Strom are developing their Colorado mine.

Personal.

W. B. DEVEREUX has returned from Salt Lake City to Boston.

W. P. HAMMON has returned from Plumas Co. to Oroville, Cal.

JOS. R. LUXON has been appointed Supt. Stratton's Independence, Colorado.

W. S. KEYES of San Francisco is in Rossland, B. C., as expert in a mining case.

ALGERNON DEL MAR is in southern California examining mines for Eastern parties.

G. S. RITCHIE of San Francisco is examining mining property in northern Idaho.

W. A. CLARK is at Jerome, Arizona, and plans a large cyanide plant for the United Verde.

ARTHUR WINSLOW, general manager and Supt. U. S. & B. C. M. Co., is visiting Telluride, Colo.

BENEDICT CROWELL of Cleveland, Ohio, is visiting his mining property at Grant's Pass, Or.

E. H. BENJAMIN, secretary California Miners' Association, has returned from Calaveras Co., Cal.

I. C. MILLER of Rawlins has been elected president Ferris-Haggerty Copper M. Co. of Wyoming.

WILLIAM MCMILLEN of Nevada has been appointed inspector of surveyors general and local land offices.

L. F. J. WRINKLE has been appointed Professor of Mines and Mining Engineering at the Nevada State University.

B. C. PEYTON, late Supt. California Powder Works, has returned to San Francisco from Carlsbad, Germany.

F. PARRISH is now manager B. C. M. Co., Greenwood, B. C., and is raising an average of 100 tons of copper ore daily.

J. R. RYAN, Supt. Comstock Pumping Association and of the Con. Cal. & Va. mine, has returned to Virginia City, Nevada.

THE Mineral Mountain M. Co. has appointed C. W. Maxson its New Mexico agent, with headquarters at Lordsburg, N. M.

JOHN W. FLEMING of Silver City, New Mexico, six years U. S. coal mine inspector for New Mexico, has sent his resignation to Washington, D. C.

T. TRAFFORD WYNNE, representing the Touzdou & Janson Mining Engineering Co. of London, is investigating the mineral resources of Mexico.

MRS. E. C. ATWOOD, treasurer International Mining Congress, Empire, Colo., says the June, 1901, meeting at Boise, Idaho, will be more of a success than the last one.

LIEUTENANT HERBERT DEAKYNE of the U. S. Debris Commission, and Hubert Vischer, deputy commissioner and engineer, are at Marysville, Cal., looking over the projected barrier work.

SUPT. MCWILLIAMS will discharge the duties formerly devolving upon David Keith, whose other engagements have compelled him to relieve himself of the management of the Anchor mine, Park City, Utah.

W. ROBERTSON, British Columbia provincial mineralogist, is at Atlin holding an examination of intending assayers to admit those qualifying to practice their profession in British Columbia, Atlin applicants for assayers' certificates being thus saved the cost and trouble of a voyage to Victoria.

COLORADO'S LABOR COMMISSIONER, J. T. SMITH, has returned to Denver from an extensive trip over the mining sections and says that he found that there are about 31,000 men employed in the gold and silver mines of the State. Their wages run from $2.50 to $3.50, and the proportion of men employed at the various wages makes an average wage of $2.90.

Catalogues Received.

THE most striking and unique trade catalogue received this year comes from Arthur Koppel, 68 Broad St., New York City. It is 10x14 inches and has a front-page illustration that is striking in every sense of the word. The contents are cosmopolitan in their character, being a description in all the principal European languages of the mining appliances, more especially the Koppel transportation devices, made and supplied by Arthur Koppel of Berlin. Finely engraved views of nearly every part of the world are presented, portraying the operation in Europe, Asia, Africa and America of the Koppel tramway system. The all-embracing idea of such a trade album has been well carried out in the execution.

CATALOGUE NO. 4, third edition, and Catalogue No. 10, third edition, published by the Risdon Iron Works, San Francisco, are received. No. 4 treats of the Risdon patent tangential wheel, which is elaborately illustrated and specifically described; there are ten solid pages of figures, giving horse power, miners' inches, cubic feet water per minute and revolutions per minute of the Risdon water motor and water wheel, based upon a power efficiency of 85%. There is besides considerable practical information of value to users of water everywhere. No. 10 is entirely devoted to detailed illustrated description of the pumping machinery made by this firm, including some newly patented valve mechanism, which, like other devices, is illustrated in sectional detail. The usual general tables and additional technical formulæ are appended. The outside back cover gives a good view of the new Risdon Iron Works ship building plant. The Risdon now copyrights its catalogues. The entire series comprise seventeen handsome technical treatises on subjects connected with all forms of mine work.

Books Received.

"The Metallurgy of Lead," H. F. Collins: octavo, pp. 368, with numerous illustrations. This is a companion volume to "The Metallurgy of Silver," by the same author, received and reviewed some months ago, and is of equal value. Being of later date than Hoffman's—the latest edition of that work to hand being dated 1894—it contains considerable up-to-date information. It is edited by W. C. Roberts-Austen, and goes at considerable length and with great detail into Australasian practice in smelting and desilverization. The book is a decided addition to metallurgical literature, and, judged by the criterion of fitness, should have considerable sale. It is published by Chas. Griffin & Co., Ltd., Exeter St., Strand, London, England.

List of U. S. Patents for Pacific Coast Inventors.

REPORTED BY DEWEY, STRONG & CO., PIONEER PATENT SOLICITORS FOR PACIFIC COAST.

FOR WEEK ENDING AUGUST 21, 1900.

656,383.—BOX PRINTING MACHINE—J. F. Ames, Portland, Or.
656,498.—PICK—W. P. Bevington, Escondido, Cal.
656,596.—ARTIFICIAL TOOTH—R. E. Campbell, S. F.
656,395.—LEACHING ORES—E. H. Dickie, Bodie, Cal.
656,245.—PADLOCK—J. T. Dufau, S. F.
656,249.—MANHOLE OPENING—R. Herman, S. F.
656,405.—HARNESS SUPPORT—W. R. Hewitt, S. F.
656,581.—WATER GATE—W. H. Kiler, Pomona, Cal.
656,415.—SPREADING AND TRUING DRILLS—D. G. Morgan, Quartz, Cal.
656,418.—DRAWING STEAM BEER—J. O'Connor, S. F.
656,374.—ROTARY BRUSH—W. H. Robinson, Alameda, Cal.
656,484.—CARBURETOR—J. E. Shearer, Chico, Cal.
656,331.—WATER PURIFIER—H. Stillman, Sacramento, Cal.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

LOCK.—No. 655,921. Aug. 14, 1900. P. V. Cornils, San Francisco, Cal. This invention relates to improvements in locks for doors, and its object is to provide for a compact lock mechanism which is containable within doors having but little thickness. It comprises mechanism by which the bolt may be prevented from moving except by the use of a key; means by which the outside and inside knobs may be connected or disconnected at will, and the bolt prevented from moving over from its locked or unlocked position. The knob shanks are independent and act upon the spring-pressed slidable locking bolt which they meet transversely to its line of travel. One of the knob shanks has a hollow sleeve with a lug to engage the lock bolt, and the other has a head fitting and turnable in the sleeve with a transversely slidable spring pressed block adapted to engage the sleeve when projected. Spring-pressed tumblers are slidable longitudinally in the shank and through an opening in the slidable block, said tumblers being normally held in position to retain the block within the head. Slots are formed transversely in the tumblers and the key has bits so formed as to move said tumblers through the sliding block until the transverse slots are in line therewith. A spring then projects the block to engage the surrounding sleeve and a slot or channel is formed in the key shank, and a pin in which the key fits, over which the slot is slidable when the key is properly introduced.

CLUTCH.—No. 655,906. Aug. 14, 1900. Joseph A. Moore, Paauhau, Hawaii. This invention relates to a device for driving and interrupting the movements of apparatus requiring such intermittent movements. It is especially designed for the transportation of sugar cane and the like from points where it is collected to the crushing rolls, but is also useful in any connection where similar conditions occur, and in which it is at times desirable to temporarily interrupt the travel of the apparatus. It consists of a drum fixed upon the shaft to be driven, a driving wheel, a friction wheel loosely turnable upon the shaft contiguous to the ends of the drum, a rope having its ends connected respectively with the driving wheel while the intermediate portion is loosely coiled about the drum. A frictional band is employed and means by which it is tightened about the wheel so that the rope is tightened upon the drum, and motion transmitted to it and the shaft. Guides extend from the driving wheel paralled to and in proximity with the surface of the drum whereby the rope is retained in position.

DEVICE FOR DRAWING STEAM BEER.—No. 656,418. Aug. 21, 1900. James O'Connor, San Francisco, Cal. This invention relates to an apparatus which is designed for drawing liquids under pressure, such as steam beer, etc. It consists of connections between one or more casks and a distributing chamber and connections between said chamber and a cylinder containing a piston which is reciprocable within the cylinder, so that when beer is admitted into the cylinder, the piston will be moved toward the opposite end until the desired amount of beer has been admitted, which is shown by a suitable recording device. The beer is drawn from the cylinder through a discharge cock, and the gas in the beer is so diffused and caused to escape so that little or no foam results when it is drawn from the cylinder. The second cylinder in line with the first contains a piston, a common rod connecting the two pistons so that they move in unison. A four way cock is interposed between the cylinders and the water under pressure is brought through this cock and allowed to enter the second cylinder while the beer is entering the first and the cock is then turned to allow the water to escape from the second cylinder, and to enter the first cylinder so as to return the piston to its normal position after the beer has been drawn.

Commercial Paragraphs.

THE Vulcan Iron Works of San Francisco has about completed the iron work at the Nevada county, Cal., courthouse.

THE contract for the erection of the Grand Encampment, Wyo., smelter is let to the Allis Machinery Co. of Milwaukee, Wis.

THE Weber Gas & Gasoline Engine Co. have sold a 10 H. P. motor to the Oro Verde M. & M. Co. at Yankee, Colo., to drive the air compressor and for lighting purposes.

ON September 1, 1900, the Edw. P. Allis Co., Milwaukee, Wis., discontinued their office at Butte, Mont., and established a branch office at Spokane, Wash., 110 Mill street, in charge of H. V. Croll.

THE Risdon Iron Works of San Francisco have been granted by the harbor commissioners space on the water front adjacent to the property of the works for a large floating dry dock. With the recent acquisition of the former Pacific Rolling Mills, the Risdon Co. is coming into position to enter the shipbuilding field on a large scale.

Recently Declared Mining Dividends.

Hecla M. Co., Idaho, $20,000	Sept. 5
Union G. M. Co., Colorado, 25 cents per share	Sept. 1
Gemini M. Co., Utah, $10 per share, $50,000	Sept. 1
Yreka M. & M. Co., California, $5 per share	Sept. 1
Acacia M. Co., Colorado, 1 cent per share, $15,000	Sept. 15

Latest Market Reports.

SAN FRANCISCO, Aug. 30, 1900.

SILVER—Per oz., Troy: London, 28⅜d (standard ounce, 925 fine); New York, bar silver, 61⅜c (1000 fine); San Francisco, 61⅝c; Mexican dollars, 49⅝c.

Shipments of silver to Europe during the past two or three months have been exceptionally heavy. The demand has been credited to the trouble in China. A large quantity of the metal will be required for the payment of foreign troops stationed in the Far East.

The London Financial Times, in commenting on the British Board of Trade returns, says: "The bullion movements are worth a passing reference. For the month of July the imports of gold and silver declined from £5,159,000 to £2,446,000, while the exports increased from £1,621,000 to £2,134,000. For the seven months there was a decrease, in round figures, of £7,000,000 in imports, and of nearly £5,000,000 in exports. The principal shrinkage is, of course, in the imports from South Africa, which have dwindled from £11,224,000 to £210,000, while the bulk of the exports went to France, Germany, Mexico, South America and British India, a large increase in the shipments to the last-named country being particularly noticeable. On the other hand, hardly any bullion was dispatched to the United States, notwithstanding the heavy exports of merchandise from that quarter, a fact which tends to show that we are paying for our American purchases by other methods than by cash, and we imported from that country £8,720,000 worth of bullion, as against £7,201,000 in 1899 and £4,891,000 in the previous year."

COPPER.—New York: Lake, 1 to 3 casks, 16.87½ cash; carload lots, 16.62½; Electrolytic, 1 to 3 casks, 16.75; carload lots, 16.50; Casting, 1 to 3 casks, 16.62½; carload lots, 16.37½. San Francisco: 17. Mill copper plates, 20c; bars, 22@23c.

LEAD.—New York, $4.35; Salt Lake City, $4.15; St. Louis, $4.20; San Francisco $5.00, carload lots; 5½c 1000 to 4000 lbs.; pipe 6¾, sheet 7½, bar 6c. London, £17 10s.

One year ago zinc ore's top price was $45 a ton and lead ore was $27 per 1000 pounds. Last week's prices were $29 and $23.50. The high prices paid for zinc ore a year ago served as a stimulus to mining in the Missouri–Kansas district and many mines were opened up and worked profitably then that have been since abandoned.

SPELTER. — New York, $4.10; St. Louis, $4.05; San Francisco, ton lots, 5½c; 100-lb lots, 5¾c.

ANTIMONY.—New York, Cookson's, 10½c; Hallett's, 9½c; San Francisco, 1000-lb lots, 12c; 300 to 500 lbs., 13@14c; 100-lb lots, 15@18c.

IRON.—Pittsburg, Bessemer pig, $16; gray forge, $14.50; San Francisco, bar, per lb., 2¾c. in small quantities.

The total exportation of pig iron from the United States during the first seven months of this year amounted to 89,810 tons, against a total of 162,936 tons for the same period a year ago.

STEEL.—Bessemer billets, Pittsburg, $18.50; sheet bars, $23.50; San Francisco, bar, 7c to 12c per lb.

QUICKSILVER. — New York, $50.00; large lots: London, £9 5s; San Francisco, local, $48.50 ℔ flask of 76½ ℔s.; Export, $45.50.

A Nome, Alaska, correspondent says: "I saw quicksilver, that sold at $1 per pound at Seattle just before we left, sell here for 45 cents," another case of oversupply.

MAGNESIUM.—New York, $3.00 ℔ ℔.; San Francisco, $4.00.

ZINC.—San Francisco, 5½c; slab, 6c; bar, 7¾c.

SOLDER. — Half-and-half, 100-℔. lots, 21c; San Francisco, Plumbers', 100-℔. lots, 17¾c.

BABBITT METAL.— San Francisco, No. 1, 10c.

TIN.—New York, pig, $31.75; San Francisco, ton lots, 33c; 1000 ℔s., 33½c; 500 ℔s., 34c; less, 35c; bar tin, ℔ ℔, 40c.

ASSAY LITHARGE.—San Francisco, 10c ℔ ℔, small lots.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 35c.

PLATINUM.— San Francisco, crude, $17 ℔ oz.; New York, $18.25; manufactured, $19.50@22.00.

BISMUTH.—New York, ℔ ℔., $1.60 50-℔ lots; San Francisco, $2.50 to $2.75 ℔ lots.

NICKEL.—New York, 50@60c ℔ ℔.

TUNGSTEN.—New York, ℔ ℔., 95c; San Francisco, $1.15.

FERRO-TUNGSTEN. — New York, 37%, 35c; San Francisco, 65c (60%).

FERRO-MANGANESE. — Pittsburg, 80%, domestic, $85, large lots.

POWDER.—F. o. b. San Francisco: No. 1. 70% nitro-glycerine, per ℔., in carload lots, 15¼c; less than one ton, 17¼c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11¾c; less than one ton, 13¾c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2 per keg.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9, in lots not less than 1000.

FUSE.—Triple tape, $3.60 per 1000 feet; double tape, $3.00; single tape, $2.65; Hemp, $2.10; Cement No. 2, $3.00; Cement No. 1, $2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 12¼c ℔ set; 14 oz., 40s., 11¼c.

CHEMICALS.—Cyanide of potassium, 98%–99%, jobbing, 32½@34½c ℔ ℔.; carloads, 31@32c; in 10-℔. tins, 40c; sulphuric acid, 66% B, 2c ℔ ℔.; soda ash, $1.60 ℔ 100 ℔s. 58%; hyposulphite of soda, 2¾@3c ℔ ℔.; blue vitriol, 5½@6c ℔ ℔.; borax, concentrated, 7@8c ℔ ℔.; chlorate of potash, 12@13c; roll sulphur, 6c; alum, $1.90@2.00; flour sulphur, French, 2¼@2½c; California refined, 1¾@2c; nitric acid, in carboys, 8c ℔ ℔.; caustic soda, in drums, 3@4c ℔ ℔.; Cal. s. soda, bbls., $1.00; sks, 95c ℔ 100 ℔s.; chloride of lime, spot, $2.50@2.60; nitrate of potash, in kegs, 8c; caustic potash, 10c in 40-℔. tins.

SITUATIONS WANTED.

Position as chief engineer at mines. Go anywhere. Have family. Long experience with mining machinery. R. J. Blackwell, Temescal, Riverside Co., Cal.

WANTED.—SITUATION BY A MAN OF EXperience who is competent to take charge of a gold mine. Understands assaying, surveying, and has business qualifications. Best of references as to character and ability. Address K. C., this office.

WANTED.—SITUATION BY A COMPETENT and experienced millman on concentrators or battery frame. Highest references. Address L. W , 509 Kearny street, room 2, first floor, San Francisco, Cal.

WANTED.—SITUATION AS MANAGER OF producing or developing property. Twelve years' experience in gold mining and milling, copper mining and smelting. Address C. H., care of Mining and Scientific Press.

WANTED.

A Rich Placer proposition, adapted to working by Railroad Steam Shovel, or Dry Land Excavator. Description, with price and terms, to receive attention must be accompanied by reliable reports and references.

Address: EDWARD N. BREITUNG,
MARQUETTE, MICH.

Cable: "Risdon's." Code: A. B. C. & Leiber's.

MANUFACTURERS OF

Gold Dredging Machinery

And COMPLETE EQUIPMENT for Placer Mines OUR SPECIALTY.

We build **GOLD DREDGES COMPLETE IN RUNNING ORDER** to handle 2500 cubic yards per day at a cost of 3 cents per cubic yard.

We excavate 50 feet below water, 20 feet above water and handle boulders up to one ton weight.

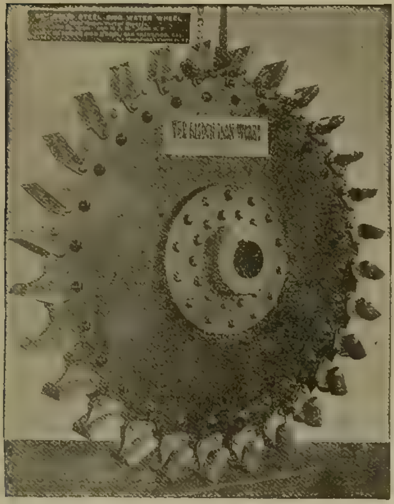
Send for Dredging Catalogue No. 17.

—WE ALSO BUILD—

All kinds of Mining, Milling, Concentrating, Pumping, Air Compressing, Hydraulic, Water Wheel and Hoisting Machinery.

EVANS HYDRAULIC GRAVEL ELEVATORS.

We publish sixteen catalogues. Write for one in the line you are interested in.



TANGENTIAL WATER WHEELS

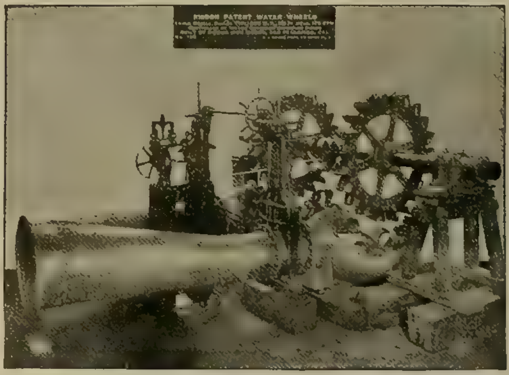
MANUFACTURED BY

RISDON IRON WORKS,

SAN FRANCISCO, CALIFORNIA.

We build Water Wheels for any head and for any power. Complete electrical power generator wheels a specialty. Large wheels up to 50 feet diameter for driving compressors.

SEND FOR CATALOGUE NO. 4.



JOSHUA HENDY MACHINE WORKS,

Principal Office: NO. 42 FREMONT STREET. - - - Works: Corners Bay, Kearny and Francisco Streets, SAN FRANCISCO, CAL.

SPECIAL DEPARTMENT OF

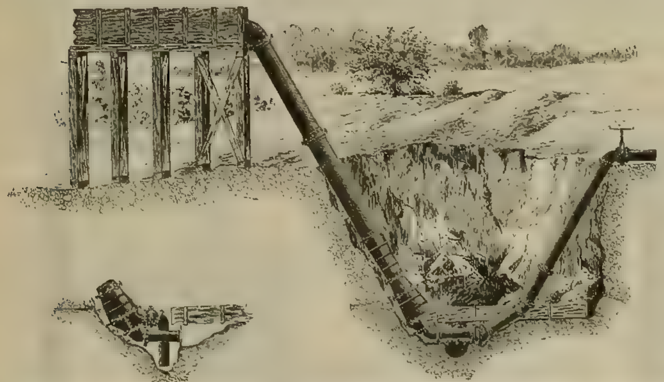
Hydraulic Mining Machinery,

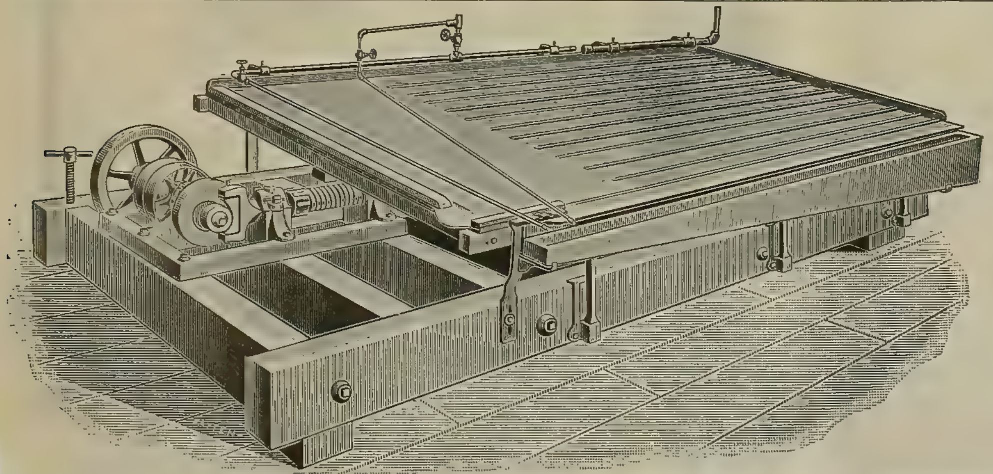
Comprising Hydraulic Gravel Elevators, Double-Jointed Ball-Bearing and Single-Jointed Giants, Sheet-Iron and Steel Water Pipe and Fittings, Water Gates, Etc.

NOTICE.—All other forms of Hydraulic Gravel Elevators are simply poor imitations in construction and infringements of the patents held by us.

The Double-Jointed Ball-Bearing Giants recently perfected and patented by our MR. JOHN H. HENDY are incontestibly superior to any other form of Giants yet introduced.

We are prepared to furnish plans and estimates of cost of any proposed Hydraulic Mining Plants upon any specifications submitted to us, and tender the services of our Hydraulic Mining Engineer to erect and place same in successful operation under guarantee.





WOODBURY'S IMPERIAL CONCENTRATING TABLE.

THE Imperial Concentrating and Amalgamating Table is the latest invention of Mr. Geo. E. Woodbury, whose fame as one of the pioneer concentrator builders is world wide, machines of his manufacture being in general use in every country on the globe where the milling of ores is carried on. This Table is, however, built on entirely new lines, differing materially from either the well-known belt or bumping table types of concentrators.

SIMPLE IN ITS CONSTRUCTION.

SAVES FINE SULPHURETS.

WITHOUT LOSS IN TAILINGS.

MAKES HIGH PRODUCT.

CAPACITY FROM 5 TO 10 STAMPS.

GEORGE E. WOODBURY,

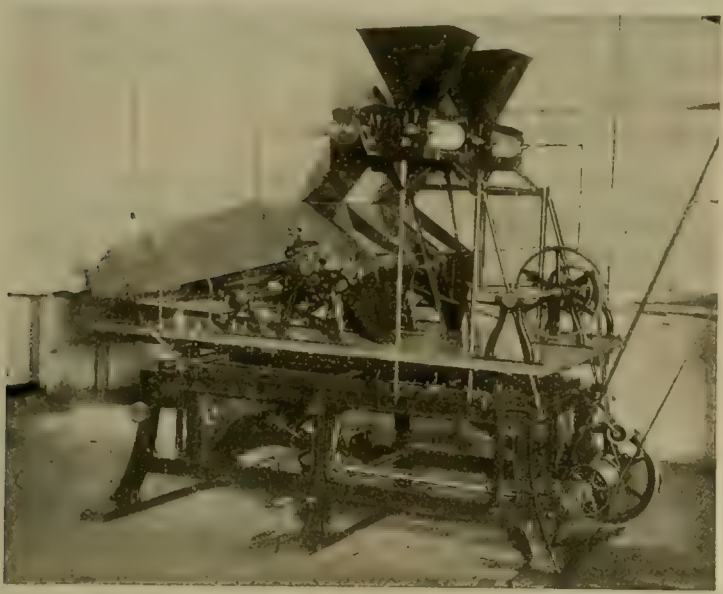
Send for Catalogue. *'Phone Main 1766.* 223 First St., San Francisco, Cal.

DEWEY, STRONG & CO., Patent Agents, 330 Market St., S. F., Cal.

CROWN GOLD MILLING CO.

Manufacturers of the "CROWN" CONCENTRATOR and CROWN ORE SIZER. A dry process of sizing and concentrating ore, sand or gravel. Designed to accord fully with the laws of specific gravity, and especially adapted to refractory ore or localities where there is no water.

The chief claims for the Crown Concentrator are that it occupies less floor space and has nearly four times the capacity of any wet concentrator; that it will concentrate ores containing base and refractory metals that ordinarily slime and carry off values; that it effects a saving of values far above the ordinary methods of concentration.



We have, now in operation, a complete plant for crushing, sizing and concentrating ores by the

Crown Dry Milling Process.

Mine owners desiring tests made can forward us, freight prepaid, not less than 1000 lbs. nor more than 4000 lbs. of sample, for which a charge of $20 will be made. (This amount includes assaying, etc.)

Ores for which this process is adapted and of which consignments are solicited are any concentratable ores, pulps, tailings, or sands, carrying sufficient values, whether they have heretofore been profitably concentrated or not.

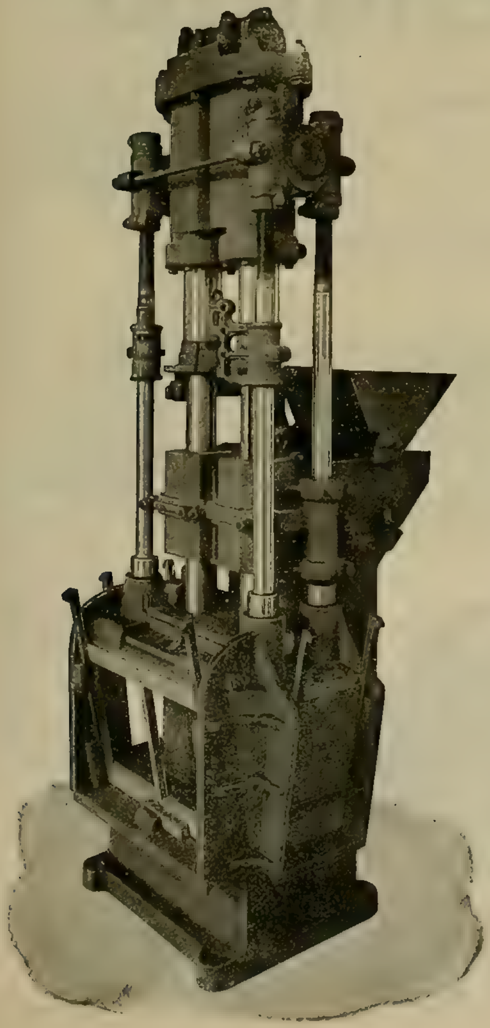
CATES IRON WORKS.

THE TREMAIN STEAM STAMP MILL



has made many fortunes for its owners. It costs but little money. Can be transported anywhere.

A Money Maker in Nicaragua.

MURRA GOLD MINING COMPANY, NICARAGUA, C. A.
NICARAGUA, June 20, 1899.

GATES IRON WORKS, CHICAGO.—GENTLEMEN:

After ane xperience covering a period of three years with both the first and improved "Tremain Steam Stamp Mill," in every particular I havet ound it perfection—a money maker, and just the thing for a small capital, while companies organized on a large scale would do well to look into its merits.

I find no difficulty in crushing eight tons of ore per day and running on hard ore. This mill should be a winner.

Very truly yours,
[SIGNED] L. W. ADAMS,
General Manager Murra Gold Mining Co.

Eight Years in Operation Without a Cent for Repairs.

GOLDEN P. O., JOSEPHINE CO., COLO., December 23, 1899.

GATES IRON WORKS, CHICAGO.—GENTLEMEN:

Our Tremain Mill is giving us good results, and although being in operation since 1892 has not cost us $1 for repairs, and to-day is making 80 drops per minute with 95 lbs. steam pressure.

The ore we are working at present is soft and we mill in 24 hours, using No. 10 slot screen, 15 tons.

Yours truly,
M. C. DAVIS,
Superintendent Sarah Belle Mines.

Running Under Compressed Air in West Australia.

293 ST. GEORGE'S TERRACE, PERTH, W. A., February 6, 1900.

F. R. PERROT, ESQ., AGENT OF GATES IRON WORKS, PERTH, WEST AUSTRALIA.

DEAR SIR: In reply to your enquiry as to the working of the Tremain Mill on the Burbanks Grand Junction, I would state that at the start we worked this from the boiler supplied by the Gates Iron Works Company, but owing to certain irregularities of the running, which were in a measure due to the intermittent supply of ore and the short time that we were able to run it per day, I finally laid on air piping from my air compressor, a quarter of a mile distant, and used the boiler as an air receiver, with the result that I got an absolutely constant run, which, I believe, averaged about 105 drops per minute, and this was kept up with great regularity and showed a much better return in the treatment of the ore. The usual air pressure in this case was 80 lbs., whereas under steam we were not so satisfied with the result as worked at 100 lbs. By this we were also saved in cost the charges of stoker, fuel and water, and it was worked with much greater cleanliness, and during the whole time the mill was running—which was several months—it never froze up on us or showed any signs of trouble in that direction.

The mill is now temporarily stopped, but when it is again started I shall most decidedly continue the use of compressed air.

Yours faithfully,
[SIGNED] GEO. HEWER.

NO TROUBLE TO OPERATE--A BOY COULD RUN IT.

TO ASSAYERS:

This is our DOUBLE MUFFLE FURNACE, No. 37. The lower muffle is 10x16x6 inches, and will hold eight 20-gramme crucibles. The upper muffle is 6x12x4 inches.

One Cary burner, size 2 1-4 inches, heats both muffles simultaneously.

Starting with a cold furnace and burner, the first batch of eight crucibles can be poured in less than one hour from time of lighting match, and same cupelled in one hour and a half.

When furnace has become thoroughly heated, melts may be made every twenty minutes and cupellations every twenty-five minutes.

THE GRIFFIN
THREE ROLLER
ORE MILL.

The Griffin Three Roller Ore Mill is a simply constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilian Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

THE LITTLE ALASKA GOLD WASHER.

Price **$6.** Saves the Gold. *Weighs only* 7 1-2 Lbs.

After several years' practical use in different fields, our washer has established its superiority over all placer or beach washers. It is just the washer for Cape Nome; it was used extensively in Alaska last year with every success. In working the operator does not have to wet his hands and can stand in an upright natural position. It is just the washer for the poor man who has not the money to put in expensive machinery. It will do the work of ten men with gold pans. It is just the washer for the prospector, being light and easy to pack. Don't fail to write us if in need of a washer; we can save you *time, labor* and *money.* RUSSELL & KINSEY, 1237 Magnolia Ave., Los Angeles, Cal

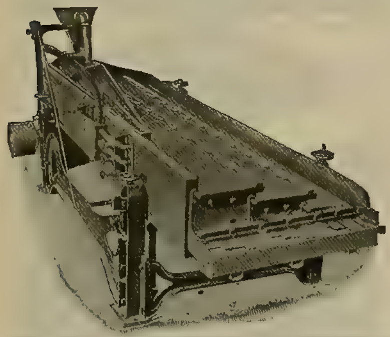
THE IMPROVED BARTLETT CONCENTRATING TABLE.



The BARTLETT CONCENTRATING TABLE has been GREATLY IMPROVED recently by the substitution of iron in place of wood wherever possible. It is now built with SOLID IRON TOP, PLANED TO A TRUE SURFACE AND POLISHED; all parts are made by template and EACH PART BEING INTERCHANGEABLE. As now constructed, the table has no special wearing parts and will last for many years. It has a CAPACITY OF FROM FIFTEEN TO FORTY-FIVE TONS IN TWENTY-FOUR HOURS, according to the class of ore worked. It is the only table in the world which will take the place of jigs and do away with all costly and complicated machinery.

It is Especially Designed for Separating Zinc from Lead.

Send for our illustrated catalogue, containing all the latest information on the concentration of ores.

THE

Pelton Water Wheel Company

Gives exclusive attention to the development and utilization of water powers by the most modern, economic and improved methods. An experience of more than fifteen years, involving both the theory and practice of hydraulic engineering as relates to power development in its widest range of application, is at the service of its customers.

Nine Thousand Wheels Now Running,

Averaging some 700,000 H. P.

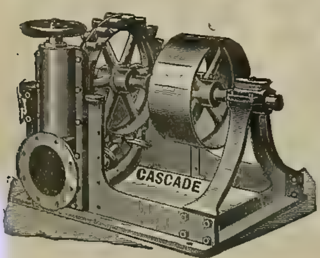
ELECTRIC POWER TRANSMISSION.

Pelton wheels afford the most reliable and efficient power for such service and are running the majority of stations of this character in the United States, as well as most foreign countries. Highest efficiency and absolute regulation guaranteed under the most extreme variations of load.

The Pelton Water Wheel Company,

121 & 123 MAIN STREET, SAN FRANCISCO, CAL.

TURBINE AND CASCADE WATER WHEEL



Adapted to all Heads from

3 Feet to 2000 Feet.

Our experience of 38 YEARS building Water Wheels enables us to suit every requirement of Water Power Plants. We guarantee satisfaction.

State your Head and requirements. Send for pamphlet.

ASSESSMENT NOTICES.

GOULD & CURRY SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 6th day of August, 1900, an assessment (No. 91) of fifteen (15) cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room No. 69, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 8th day of September, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 1st day of October, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

ALFRED K. DURBROW, Secretary.

Office—Room No. 69, Nevada block, No. 309 Montgomery street, San Francisco, California.

BEST & BELCHER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia District, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 3d day of August, 1900, an assessment (No. 71) of fifteen (15) cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room 33, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 7th day of September, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on FRIDAY, the 28th day of September, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

M. JAFFE, Secretary.

Office—Room 33, Nevada block, No. 309 Montgomery street, San Francisco, California.

ALLIANCE EXPLORATION & MINING COMpany.—Location of principal place of business, San Francisco, California; location of works, Ophir, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 3d day of August, 1900, an assessment (No. 3) of five (5) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 236 Sutter street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 11th day of September, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 2nd day of October, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

S. GOLDSMITH, Secretary.

Office—236 Sutter street, San Francisco, California.

EUREKA CONSOLIDATED DRIFT MINING COMpany.—Location of principal place of business, San Francisco, California; location of works, Forest Hill, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 9th day of August, 1900, an assessment (No. 26) of one (1) cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 214 Pine street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 8th day of September, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on SATURDAY, the 29th day of September, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

GEO. W. DIXON, Secretary.

Office—214 Pine street, San Francisco, California.

SAVAGE MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 13th day of August, 1900, an assessment (No. 101) of ten cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Rooms 20-22, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 18th day of September, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 8th day of October, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

JOHN W. TWIGGS, Secretary.

Office—Rooms 20-22, Nevada block, No. 309 Montgomery street, San Francisco, California.

AMERICAN OIL AND REFINERY COMPANY.—Location of principal place of business, San Francisco, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 21st day of August, 1900, an assessment of ten (10) cents per share was levied upon all the subscribed capital stock of the said corporation, payable immediately to J. C. Anthony, secretary of said corporation, at its office, at room No 323 of the Parrott building, Nos. 825 to 855 Market street, in the City and County of San Francisco, State of California.

Any stock upon which this assessment shall remain unpaid on the 26th day of September, 1900, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on MONDAY, the 29th day of October, 1900, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

THE DODD IMPROVED CONCENTRATOR
UNION IRON WORKS SAN FRANCISCO CAL.

Patented Dec. 5, 1899; May 29, 1900.

THE DODD CONCENTRATING TABLE,

which we illustrate herewith, is the latest and most improved machine of this class now made.

This type of machine is so well known that little or no description is required. It is specially adapted for ores carrying a heavy percentage of sulphurets; has a large capacity and effects a clean separation.

The operating mechanism can be easily adjusted to meet the requirements of any character or condition of ore; it is simple, durable and efficient, and gives universal satisfaction.

For further particulars, address UNION IRON WORKS, San Francisco, Cal.

Some Modern Explosives.

Gunpowder is not a definite chemical compound like gun cotton and lyddite, but a mixture in a state of unstable equilibrium. On explosion six-tenths of its weight remains in the solid form, giving rise to the well-known dense clouds of smoke. Cordite is an explosive that has come into wide use. It is made in many various forms, usually in fine threads woven into a cord. Though originally intended for small arms, cordite has been largely employed of late in charging heavy guns. The absence of smoke renders its use advantageous in warfare. When fired in a gun the time taken to consume the charge is only a small fraction of a second. It burns in air without explosion, but it will not burn in the absence of oxygen. When placed in a confined space the combustion is attended by explosive force. Cordite may be burned under water, because the heat developed during combustion is so excessive as to supply the atmosphere necessary for combustion to continue.

Ballistite, a mixture of nitro-cellulose and nitroglycerine, is used as an explosive. It is made in various forms, commonly in square slabs, cubes or cylindrical tubes. Nitro-cellulose has a serious defect in that when a certain pressure is attained this substance has the remarkable property of still further increasing that pressure. Picric acid is largely used in the production of lyddite shell. It is fusible and difficult to ignite, burns slowly, and is not free from smoke. The green smoke referred to by war correspondents is due to imperfect methods of preparation.

Of the many explosives now in use cordite is inferior to none in ballistic power. In considering the relative explosive force of one explosive with another, it should be remembered that the method of igniting has much to do with the effect, as seen in the case of cordite. A slab of gun cotton might be burnt in air without any other unpleasant effect than that produced by the smoke. If, however, a few grains of fulminate of mercury were struck smartly in its neighborhood, an explosion would be the result.

Following is a condensed account of the use and manner of preparation of different fulminates:

Fulminate of mercury is used for filling percussion caps. It is prepared on a large scale by dissolving one part of mercury in twelve of pure nitric acid of 1.36 specific gravity, and adding twelve of spirit of wine, when a violent reaction takes place, which is kept in check by adding gradually more alcohol. First, the liquid becomes black by the separation of metallic mercury, which, however, soon disappears. When the liquid becomes cool, the fulminate of mercury separates as a crystalline powder. It is nearly insoluble in cold water; from a boiling solution it is obtained in white prismatic crystals. When kindled in the open air, it burns away like gunpowder, but, by percussion, it is decomposed with a violent detonation. The explosion of the fulminate is so violent and rapid that it is necessary to moderate it for percussion caps. For this purpose it is mixed with potassium nitrate or chlorate. For gun caps, potassium chlorate is generally mixed with the fulminate, and powdered glass is sometimes added to increase the sensibility of the mixture to explosion by percussion. After a little of the composition has been introduced into the cap, it is made to adhere by a drop of solution of shellac in spirit of wine, which renders it also water-proof.

Fulminate of silver is prepared by dissolving ten grains of pure silver at a gentle heat in seventy drops of concentrated nitric acid of 1.42 specific gravity and fifty drops of water. As soon as the silver is dissolved, the heat is removed and 2000 drops of alcohol are added. If the action does not commence after a short time, a very gentle heat may be applied until effervescence begins, when the fulminate of silver will be deposited in minute needles, and may be further treated as in the case of fulminate of mercury. When dry, the fulminate of silver must be handled with the greatest caution, since it is exploded far more easily than the fulminate of mercury. It should be kept in small quantities, wrapped up separately in paper, and placed in a pasteboard box. The violence of its explosion renders it useless for percussion caps, but it is employed in detonating crackers.

Fulminating platinum is obtained by dissolving binoxide of platinum in diluted sulphuric acid and mixing the solution with an excess of ammonia, when a black precipitate will result which detonates violently at about 400° F.

Fulminating gold is obtained as a buff-colored precipitate when ammonia is added to a solution of terchloride of gold. It explodes violently when gently heated.

Keeping and Indexing Notes; A San Francisco Workshop; Paris Fair Awards; Electricity in Various Things, 286. Personal; List of U. S. Patents for Pacific Coast Inventors; Notices of Recent Patents; Recently Declared Mining Dividends; Catalogues Received; Commercial Paragraphs; Obituary, 290.

Value of Mines and Mining Stocks.

The usual number of letters are being received, mostly from Eastern investors, who have either bought or are about to buy mining stocks and want an opinion as to the advisability of such purchase as investment. Small investors are necessarily compelled to depend to a great extent upon the representations of others, and such representations are usually made by those whose interest lies in effecting sales. It is a favorite method among some mining companies to capitalize, when incorporating, for 1,000,000 shares at $1 per share, par value, and then offer the stock for from 1 to 5 cents a share.

California is given credit for originating such system, though it would appear to be another case of the pupil outdoing the instructor. The inception of such enterprise is in the gambling spirit, with which so many are imbued. A buyer of 1000 shares at 5 cents a share figures that he can not lose much and will make big returns if "things come his way." Usually business men forming companies for the legitimate development of mines now endeavor to restrict capitalization within the limit of the amount needed for development work, and with little intent to put stock on the market.

As a general thing the public does not care for that kind of stock. It prefers to take a flyer in various enterprises, and it is in deference to that sentiment that the mining companies referred to usually capitalize for say $1,000,000 at $1 a share, offering the stock at 1 to 5 cents a share. The result of the 1,000,000 shares at $1 a share sold at 5 cents a share is about the same as having a capitalization of $50,000 at par. The only difference is that the latter would have little show of general purchase, and it were much easier to sell the 1,000,000 shares at 5 cents than 50,000 shares at $1 a share.

The fact, too, that many a thousand shares of stock bought at 5 cents a share has yielded the investor from $1 to $5 a share tends to perpetuate belief in continued possibility of such infrequent profit. The temptation to fritter the money away realized from the sale of 5-cent stock ofttimes overcomes the original intent to do the work necessary to make the prospect of sufficient value to recoup the original purchasers or afford them any possibility of profit, so that the first consideration would be personal belief, justified by inquiry and knowledge, of the individual integrity of those offering the stock for sale.

The second difficulty is the correct or intelligent estimate of the value of a mine property—a conclusion that is difficult to correctly reach on the part of anyone. A mine may be worth $1,000,000, that is, there may be in the limits of the claim treasure to that amount, but if idle or unworked it might not be worth $1000. The property might have no particular value until by judicious and systematic development its worth were made manifest. All the great mines of the country were once nothing but prospects—some valued lightly if not wholly discredited. Because a mine has not been developed it can not be said that it is not contingently worth $1,000,000. The man who buys 1000 shares of stock for 5 cents a share, though the stock may represent at par value $1000, must well understand that he is not getting $1000 value for the $50 that he pays for the stock. He naturally expects that development or demand or some other contingency may make his stock, for which he pays $50, worth some greater value up to $1000, and the fact of his buying stock shows he is willing to take the risk involved in the purchase—that is, pay $50 with the expectation of getting more. Such a purchaser must know that he is gambling on futures and must recognize the usual percentage in favor of the game. If he wins he considers himself pretty clever; if he loses he can not blame anybody but himself. All he can expect is that the company shall honestly manage and faithfully develop the property to the best of its ability. He has a right to expect that the company whose stock he buys has legal title to real property. He should not assume too much, nor take anything more for granted than he can help. He should make his inquiries before instead of after purchasing the stock, and he should never put up a cent in the purchase of such mining stock that he could not afford to lose. If he buys stock in a California mining corporation he is subject to assessment, no matter what representation may be made to him. In Colorado and other States stocks are non-assessable under the law, but by special agreement stock in any mining company anywhere, may be made assessable.

The mining investor in a small way should always try to be able to make the distinction between a gamble or flyer in mining stocks and a bona fide investment. He should always try to remember that a thing is usually worth what it will fetch; that gold is always worth $20.67 an ounce; that brass can be bought for less money; that if he can buy a thousand shares of mining stock for $2.50 he must bear in mind that that has no relation to the value of bona fide investment in developed, paying mines.

All this is on the principle of caveat emptor: "let the buyer beware." Meanwhile, there is probably no form of investment more profitable than the intelligent purchase of shares in a properly conducted mining company. All mining prospects have a prospective value, aside from any visible value of the claim; such prospective values being dependent upon the location and surrounding conditions. A mine may be worth $1000 to-day, and $100,000 to-morrow. The rules regulating the organization of manufacturing enterprises and the purchase of stock therein work well in all cases, even in the purchase of mining stock. A man can get up a scheme for manufacturing a certain article and sell stock in his corporation at an absurdly low price as compared with its par value to those who think they can afford to take the chances in the possibility of his success, as some contingency in business conditions may occasion almost immediate enhancement of such values.

In general it does not help the mining interests to take a 10-foot prospect hole worth $100, incorporate it as the Copper Gong, or the Silver Lyre, or the Golden Monarch, for $1,000,000, and sell the stock to unsuspecting clerks, clergymen, servants and widows; as such action, when ordinarily unsuccessful from the point of view of the investor, helps to keep alive the suspicion that all mining enterprises have a slight taint of fraud, the result being that deserving properties often lie idle for the want of capital, just as a fraudulent sale and failure of a mining property hurts the surrounding districts for years after. Mines are easily made on paper, and it were better all around if the mine was not sold for more than the original price of the property, with the addition, in some cases, of a sufficient sum to put the workings down to a certain specified depth, and other attendant development. Then, those who secured stock in that concern could have some certainty as to how the money was being expended, provided the proceeds were so judiciously placed. No law, no advice and no amount of experience can entirely prevent misrepresentation of facts or fully compel meretricious mining companies to faithfully expend the proceeds of treasury stock in development. By a little judicious prior inquiry before the purchase of stock, those who by reason of their condition and surroundings know little of mining stocks would sometimes be saved subsequent regret.

New Concentration Process.

In the issue of July 14 appeared an extended notice of the Elmore concentration process, in which petroleum plays a prominent part—an entirely new departure, and a proposition that from its novelty has elicited comment.

The whole subject of concentration is justly assuming such prominence in the mining world that any proposition concerning it that seems based on scientific principles is entitled to consideration. Especially is this the case in such instances where the originators have taken time to make experiment on a commercial scale before announcing their claims to public approval. The article referred to was the substance of a paper read by C. M. Rolker before the London Institution of Mining and Metallurgy, and was the subject of subsequent discussion, in which it was stated that at the Glasdir mine, Wales, a practical plant had treated fifty tons a day for over two years, with satisfactory result; that the success or failure of the process depended largely on the amount of oil lost in the operation, and that the process "acted entirely independent of the specific gravities of the materials to be separated." This last we consider the most novel feature of the proposition, as, ordinarily, the different specific gravities of the several minerals constitute a most important factor in the problem of concentration, and if, in this case, such factor can be eliminated, it would tend to simplify results.

It was thought through the discussion briefly alluded to, that 80% of the Glasdir ore values could be saved, and that before using it on an ore containing a large percentage of sulphurets the great bulk of the sulphide material could best be separated by ordinary concentration methods.

The inventor was present through the discussion, and in answer to inquiries stated that he had obtained excellent results with galena ores and tellurides; with zinc ores the work was not so good; that he had practically confined his attention to copper ore, but as a matter of scientific interest the oil would "pick up" free gold, but would not pick up metallic aluminum.

Broken Hill Proprietary.

Economical advance in mining and metallurgical methods was shown two years ago in the annual report of the Broken Hill, New South Wales, Australia, Proprietary Co., where the average cost per ton of ore treated had then been reduced from £6 15s 4d to £2 3s 7d. The company's report for the six months ending May 31st, 1900, submitted at the meeting of the company July 27th, shows continued economical working and magnitude of operation. During the six months the refinery treated 16,036 tons silver-lead bullion, the most of which was shipped to China. The output of silver for the half year was 2,320,172 ounces fine, the price of which on the date of the report was 2s 5$\frac{13}{16}$d per ounce. In the same time were produced 15,472 tons lead, at a stated price of £16 17s 6d per ton. The gross profit for the half year was £129,576 16s 5d. Manager Delprat states that by the improvements in the 5000-ton concentrator there were passed through 132,165 tons ore, as against 117,996 tons during the previous half year "at a much reduced cost, and an increased recovery of metallic contents." During the half year 18,035 tons ore treated in the chlorination plant gave 96 ounces gold, 213,957 ounces silver, and 178.93 tons lead. The smelting plant treated 96,113 tons ore, the average extraction per ton being 15.91 units lead, 20.41 ounces silver. The usual elaborate schedules of mine costs accompany the report.

Concentrates.

A ROUND tank, 73½ inches high and 20 inches inside diameter, will hold 100 gallons.

THE wear and tear of shoes and dies varies from thirty to forty-five pounds per 100 tons ore crushed.

THE U. S. duty on imported quicksilver is 7 cents per pound. Copper matte is imported free of duty.

LIQUID AIR is still a chemical curiosity. It boils at 300° F. below zero, and cannot be confined for commercial use.

THE annual meeting of the American Smelting & Refining Co. will be held at 83 Montgomery street, Jersey City, N. J., Sept. 12th.

IN Gilpin county, Colo., all mill ore is estimated by the cord, meaning eight tons; smelting ore is transported and sold on the ton basis of 2000 pounds.

ONE essential to success in mining work is to know enough to know how little one knows, and how much there is to be known; close application and hard work.

THE issued folios of the U. S. Geological Survey can be had upon application to Director Walcott, U. S. G. S., Washington, D. C. They cost from 25 cents to 50 cents each.

IN the third line of the first complete item in the third column on page 247 of the issue of the 1st inst. there was a stupid mistake; the words "nitrate of ammonia" should have been omitted therefrom.

TO AID in welding steel the following, ground and thoroughly mixed, is efficacious: Carbonate of ammonia, ½ pound; soda of borax, 2 pounds; muriate of ammonia, ½ pound; black oxide of manganese, ¼ pound.

THE Copper King mine in Fresno county, Cal., and the Mountain Copper Co.'s property in Shasta county indicate the extent of the Sierra foothill copper belt, extending northwesterly and southeasterly over 400 miles.

SULPHATE OF IRON colored with Prussian blue is sometimes sold for sulphate of copper, when it does not contain 10% sulphate of copper. Commercial pure sulphate of copper is usually sold on a basis of containing 98% crystallized sulphate of copper.

TAXING the net proceeds of mines has always seemed questionable. If Jones in January pays taxes on $5000 net proceeds of his mine, and having put that into real estate Jones in June again pays taxes on $5000, it would seem to entail hardship on Jones.

"PRACTICAL" men make the best "theoretical" men; they are more likely to have a correct "theory," knowing more the lines on which a correct "theory" can be constructed. Anything that is of importance in the mining or scientific world was once nothing but a "theory" till some one with sufficient knowledge put it into tangible, workable form.

LANDS formerly in the north half of the Colville, Wash., reservation will be open for entry at noon October 10th. No settlement must be attempted on any of the lands before that date and hour. The lands in the north half of the reserve are partly in two land office districts. The Waterville office has plats of sixteen townships; ten townships are open for filing at the Spokane office.

THE South African stamps are of the kind generally used for free milling ore, heavy, rapid drop, low discharge through coarse 30-mesh—900 holes—screen, with a duty of from 3 to 4½ tons per stamp per twenty-four hours. The New Zealand stamp is more for pyritic ore, light, very long drop, sometimes 18 inches, thirty to the minute, high (20-inch) discharge through a fine screen (60-mesh, 3600 holes) where the gold is fine, saving more on the plates, the concentrates chlorinated.

THE present production of petroleum in the United States is estimated to be 150,000 barrels per day. It costs the Standard Oil Co. 1 cent a gallon to deliver its oil from refineries to mercantile dealers in Nebraska, and from ½ cent to 1½ cents a gallon to the States in general. There are two grades of crude oil produced. The present total capitalization of the Standard Oil Co. is $202,233,700. Since the formation of the trust in 1882 it has paid 280% in dividends, or $280,000,000. The dividends so far this year are $38,000,000.

SINCE Nov. 1, 1893, the date of the repeal of the purchasing clause of the Act of July 14, 1890, the purchase of silver bullion by the U. S. Government has been limited to the silver contained in gold deposits at the U. S. mints, the small fraction of silver for return in fine bars, the amount retained in payment of charges, surplus silver bullion returned by the operative officers of the mint at the annual settlement, and mutilated domestic silver coins purchased for the subsidiary silver coinage under the provisions of sec. 3526, Rev. Stat.

AT the works of the Bede Metal & Chemical Co., Hebburn, England, large quantities of copper are extracted from pyrites cinders by the wet method, the amount being too small to be profitably removed by the ordinary dry processes, averaging 3% in the unburnt pyrites, which, after being roasted, yield about 5%. The cinders are first ground with salt and heated in muffle furnaces, whereby the copper is converted into chloride. This is leached out in tanks by means of acidulated water derived from the gaseous products of the roasting. The liquor obtained contains a notable quantity of silver and a minute quantity of gold, which are precipitated by the addition of the requisite amount of sodium iodide, and the precipitate reduced by metallic zinc, the iodine being thus recovered as zinc iodide. The copper is now removed by the addition of scrap iron and purified by refining in the usual way. The leached pyrites residue is in demand for steel furnaces, as it contains 70% of metallic iron. For this purpose it is dried into masses of suitable shape.

IF an engineer or buyer, upon seeing an analysis of a certain coal, multiplies the percentage of ash given by three, he will have approximately the percentage of ash that that coal will yield under a boiler. It is not always the weight so much as the volume of ash that occasions trouble. If the percentage of ash given in the analysis be multiplied by five, it will about represent the percentage of ash by volume under the average boiler. Proper maintenance of a boiler requires that it be shut down and examined thoroughly inside and outside at least every three months.

SECTION 2511 of the Civil Code of California says: An express agreement to become partners or to share the profits and losses of mining is not necessary to the formation or existence of a mining partnership. The relation arises from the ownership of shares or interests in the mine and working of the same for the purpose of extracting the minerals there. Section 2516 of the Civil Code of that State says: One of the partners in a mining partnership may convey his interest in the mine and business without dissolving the partnership. The purchaser, from the date of his purchase, becomes a member of the partnership.

TO DETERMINE the temperature of steam at different boiler pressures, find the height of a column of mercury due to the pressure carried; extract the 6th root—that is, the square root of the cube root; multiply this by 177.2; subtract 100 from the product; the remainder will be the temperature. Suppose the steam carried registers 100 pounds by the gauge, which would be 115 pounds absolute pressure. To change pounds to inches of mercury divide by .49; 115 divided by .49 = 234. The 6th root of 234 = 2.5; that multiplied by 177.2=443. That minus 100 = 343° F., the temperature of the steam at that pressure.

IF tungsten were produced in sufficient quantities it might be more largely utilized in alloying aluminum. The alloys of aluminum and tungsten have for the past few years been especially popular for rolled sheets and plates to be afterwards spun. Under the trade name of wolfram aluminum the metal has been largely used for military equipments. The alloys of aluminum and tungsten can be advantageously used with the addition of copper and also with the triple hardeners, tungsten, copper and iron, or tungsten, copper and manganese. As usually made the aluminum is hardened with some copper; tungstate of soda and ferro-manganese are added to the bath, making an alloy of aluminum, copper and tungsten, manganese and iron.

MINING for gold in gravel is a sound and reliable form of mining investment; for, with requisite precaution, it can be made as certain as any form of work can be approximated. Where needed surveys are made, where the ground is thoroughly tested and the quantity and quality of the gravel ascertained, where proper calculation is made as to needed water, power; where the proper form of mechanism is correctly determined and the needed capital duly provided, the proposition can have nearly every element of risk eliminated from it, and becomes a simple matter of what may be considered steady output of the finished product from the raw material, the cost and profit as readily determined as in the case of the manufacture of any article for which there is a constant and unlimited demand.

PURE COPPER diminishes in strength as its temperature increases, and with alloys of copper and tin there is a rapid fall in strength and elongation at temperatures exceeding 180° to 200° C., but in some cases the strength is maintained up to 250° C., as is always the case with phosphor-bronze. Aluminum bronzes between 80° and 150° C. show a sudden drop in strength, which is much greater for cast specimens. Common brass rapidly diminishes in strength and elongation from 250° to 300° C., the breaking stress at 250° C. being only 15% of the value at ordinary temperatures. Brasses containing 1% of aluminum have a resistance of more than 28,000 pounds per square inch, with considerable elongation up to 260° C. These brasses have a higher resistance at high temperatures than bronze or rolled brass. The strength of iron and steel diminishes for temperatures between 60° and 100° C., after which it increases to its maximum at about 250° C., decreasing rapidly beyond 300° C. The reduction in section diminishes continuously from the ordinary temperature up to 300° or 350° C., while above 400° C. it increases rapidly, becoming very marked at 700° or 800° C.

PURE aluminum has a specific conductivity 67% that of pure copper. With ½% of impurity the conductivity is reduced to 61%, while with 1% impurity the conductivity is 59%. It is when are compared the castings made in the two metals that aluminum shows to best advantage, for, although both must be alloyed with other metals to give sound castings, the reduction in conductivity on this account is relatively greater with copper than with aluminum. Good nickel aluminum castings can be made having a conductivity of 45% to 50% that of rolled copper, but it is very seldom that ordinary copper alloy castings such as are used every day for switch work and similar purposes exceed this figure. There is little difference in the tensile strengths. For some time there was a difficulty in getting good aluminum alloy castings, but this has now practically disappeared owing to brass founders and others having learned by experience the peculiarities of the metal. Soldering and brazing, although they can be performed, are still the drawbacks when compared with copper, but there is this to be considered: that in most practical purposes mechanical joints may be used.

THE presence of aluminum has been found to lower the point at which alloys containing it become fluid, such alloys being fluid at lower temperatures than either gunmetal or ordinary brass mixtures. The use of aluminum in cheap ordinary brass mixtures has sometimes occasioned the complaint that the surface of the brass castings is made black by its addition. This is due to the sweating out of the lead from the brass mixture which the impure brass has contained. It is not advisable to use aluminum in brass which is to be dipped in acid, as the aluminum, even in small quantities, makes the metal withstand the action of the acid so completely that the dipping is not successful. For this reason brass, which is subject to corrosion, is found to withstand this corrosion much better if it contains a proportion of aluminum, up to, say 10%. The main objection to the considerable addition of aluminum to brass is the increased shrinkage of the alloy occasioned by the use of the aluminum. This has to be provided for by pouring the metal not too hot and using large gates and risers. Aluminum brass has an elastic limit of 30,000 pounds per square inch, and an ultimate strength of 40,000 to 50,000 pounds, with an elongation of 3% to 10% in 8 inches.

SULPHUROUS ACID, or sulphur dioxide (SO_2), is prepared by burning sulphur in dry air or oxygen gas, or by removing the elements of water, and an additional atom of oxygen from sulphuric acid by heating it together with copper chippings or mercury. The resultant gas is purified by washing, and it is collected either by displacement or over mercury. It is completely colorless, has the overpowering odor of burning sulphur, neither supports combustion nor respiration, is 2.247 times heavier than air, is easily condensed, is liquefiable by cooling down to 14° F., under ordinary atmospheric pressure, and congeals into a transparent solid at temperatures below 168° F. This gas deviates considerably from Boyle's law of pressures, and occupies less space for equal increments of pressure than does air under like conditions, this variation becoming more marked as the temperature is reduced. Sulphurous acid is extremely soluble in water, one volume of the latter at a temperature of 50° F. being capable of dissolving 51.38, and at 68° 36.22 volumes of the former. It has a molecular weight of 65 and a density of 32. The latent heat of vaporization of this liquid is 182, and it boils at a temperature of 14° F. at the tension of the atmosphere.

WITH a given tension of belt, nearly three times as much power can be transmitted by a leather-covered pulley as with a smooth iron surface. It is comparatively easy to cement leather to the face of a pulley so that it will stay for an indefinite length of time—in fact, until the latter is worn out or it is forcibly torn from the pulley. It is as easy to make such a cement joint as it would be if cementing to wood or other porous substance. Any good glue can be used, if suitably prepared and carefully spread on the iron surface. For such purposes a given amount of glue should be covered with an equal weight of water, and the whole let stand for twenty-four hours until the water is completely absorbed by the glue. The mass should then be heated in a water bath until the glue is melted. This makes a concentrated glue solution. This is to be spread on the surface of the pulley after the leather has been suitably prepared. A strong solution of tannic acid should be used for moistening the leather before it is applied to the glued surface. The solution should be applied warm. The surface of the pulley should be roughened by cross-filing, or the use of acid before the glue is applied, and the glue should be warm when the application is made. The leather used for covering pulleys may be pieces of old belting or split leather. The size of the pulley can be increased considerably by the use of the leather covering.

IN the following States resident aliens enjoy the same privileges as citizens: Alabama, Arkansas, California, Colorado, Connecticut, Florida, Georgia, Louisiana, Maine, Maryland, Massachusetts, Michigan, Missouri, Mississippi, Nebraska, Nevada, New Hampshire, New Jersey, North Carolina, North Dakota, Ohio, Oklahoma, Oregon, Rhode Island, South Carolina, South Dakota, Tennessee, Texas, Vermont, Virginia, West Virginia, Wisconsin and Wyoming. Aliens who have declared their intention of becoming citizens have the same rights as citizens in Arizona Territory, Delaware, District of Columbia, Idaho, Illinois, Indiana, Kentucky and Minnesota. Aliens can only hold real estate under certain conditions in Iowa, Kansas, Montana, New York and Utah. Aliens could only hold property by inheritance or collection of debts in New Mexico Territory, but this law has been changed by act of Congress. Aliens are not permitted to remain in the Indian Territory without the permission of the Interior Department. In Washington State aliens may hold lands containing valuable deposits of minerals, metals, iron, coal or fireclay, and the necessary land for mills and machinery to be used in the development thereof and the manufacture of the products therefrom; and real estate, other than the above, can be held on declaring intention of becoming a citizen. In Pennsylvania aliens may buy lands not exceeding in quantity 5000 acres, nor in net annual income $20,000, and hold the same as citizens may. Other aliens may take and hold, without limit, real estate acquired by devise or descent.

The Oldest Gold Mining Camp.

Written for the MINING AND SCIENTIFIC PRESS by
THEO. VAN WAGENEN.

Americans are accustomed to date the history of mining in the western United States from the days of '49; but, nearly half a century before that time, copper mining at Santa Rita, New Mexico, was a flourishing business, while thirty years back of that date (about 1770) there was a producing gold mining camp on the California banks of the Colorado river about 100 miles above its mouth—that is, productive from a Mexican point of view. The region is now known—after the rude manner of the American prospector—as the Pot Holes, but in the olden times it was first included in the settlement called San Dyonisius, and later was a part of the Mission of the Concepcion. It is no easy matter to disentangle from what remains of the ancient Spanish records the true sequence of events as they occurred in this part of the world since the white men first entered it. Perhaps one should begin with that old explorer Coronado, half priest and half soldier, who as early as 1539-40 traversed the country from the head of the Vermillion sea (Gulf of California) to Santa Fe, making good Indians out of the aborigines wherever he met them, either through baptism or the sword, as they preferred. In this trip the dry placer districts of northern Sonora were discovered, and also the mysterious ruins in the Gila valley known as the Casa Grande, but it does not appear that Coronado's trip was followed by any attempts to colonize those parts of Arizona explored, from which it may be safely concluded that no other deposits of precious metals were found on the route. So, for considerably more than 100 years following there was peace in the desert, as far as recorded history goes.

Prospecting on the Desert.

Towards the end of the seventeenth century, however, a most indefatigable and zealous Jesuit named Father Kino appeared on the scene. His normal field of labor seems to have been the county now known as Sonora and Chihuahua; but apparently it was not large enough for his ambition, for in 1692 he crossed over into Arizona—which was then called Pimeria Alta—and established a Mission in the vicinity of the now flourishing city of Tucson, which he called San Xavier del Bac. Two years later, using this post as a base, he journeyed northward to the Gila river, rediscovering on the way the Casa Grande ruins, and celebrating the incident by holding a service of the mass there. In 1697, accompanied by twenty soldiers, thirty friendly Indians and ten retainers of his own, and starting from a point in the San Pedro valley not far from the present site of Tombstone, he made a second trip to the Gila and explored its valley between Solomonville and Tempe. Again, in 1699, he crossed Pimeria from Sonoita, via Quijotoa to Gila Bend, and then working around the north ends of the Big Horn, Eagle Tail and Castle Dome ranges, struck the Colorado river about 20 miles above Yuma. In the following year he returned by a slightly different route and established on the Colorado, above the mouth of the Gila, the San Dyonisius station. In 1701 he revisited the spot, and after working among the Yuma Indians of the vicinity took boat and followed down the stream to the sea. His journal states that these Yumas had an abundance of ornaments and charms of gold which they obtained from washing the dirt of the hillsides on the California side, just across from his newly established post.

In 1711 the good father died without meantime having returned to Arizona, and for a score or more of years the field seems to have remained untilled by his successor. In 1736, however, there was a renewal of efforts at San Xavier, which was followed in 1736–41 by a great silver mining excitement close to the Arizona line and probably not far from the existing camp of Oro Blanco. Here the white metal was found in planchas or "chunks" weighing up to thirty and forty pounds. In 1750 Father Sedelmair revisited the old outpost on the Colorado, planted by Kino in 1700. He found little left, but again his records indicate the existence of a primitive gold producing industry in the vicinity. In 1771 Father Garces came up from the south, and meeting with an encouraging reception from the natives (Yumas and Cocopalis) he sent Father Anza to them in 1774, who, at the upper end of the rich alluvial plain enclosed by the great bend of the Colorado above Yuma on the California side, established the Mission of the Concepcion. One may still trace the outline of its adobe walls. It seems to have been located for the especial benefit of the miners, for the region now called the Pot Holes begins within a half mile of the ruins. What are left of the records of the Mission indicate that its establishment was followed by an immigration of Mexican miners from Sonora, who for many years worked peacefully and in a small way alongside the Indians on the hills. Previous to 1860 the gold won probably went south to Altar in Sonora; but when the United States Government established a military post on the river and made a stage route across the desert a possibility, American miners came in and the gold obtained went to Los Angeles or San Francisco. But there was never enough wealth in the vicinity to maintain an active Anglo-Saxon population. Gradually the Pot Holes retrograded into the condition of a neglected and nearly deserted camp and has remained so ever since, though each year there is always a production of nuggets and dust amounting to a few thousand dollars in value.

Looking Down the Colorado River From the S. P. Bridge, Yuma, Arizona.

Just above the Pot Holes the Colorado cuts its way through a chain of mountains which are known on the Arizona side as the Chocolate hills and on the California side as the Picacho range. Both are simply continuations of the San Bernardino range of southern California. On the Arizona side this divide extends northeastwardly to the Bradshaws, between Phœnix and Prescott, then bends northwesterly around the headwaters of the Bill Williams fork, then again northeasterly around the head of the Verde, until it culminates in the San Francisco mountains north of Flagstaff. On the California side the San Bernardino bears off northwesterly, separating the Mojave from the Colorado desert, and finally unites with the Coast range east of Santa Barbara.

Before the Colorado cut its channel to its present depth through the low point in this long divide, the region now known as the Mojave desert, together with a considerable area in Arizona, was a great fresh water lake whose shore line can be easily traced at many points, and the Colorado desert below was a part of the Gulf of California. Only the low Chocolate and Picacho ranges separated the two, and in several of the saddles in its crest can be found small gravel deposits richly spotted with gold, as if at some time part or all of the outlet had passed through them. One of these is now occupied by the wagon road leading from the Pot Holes to the Duncan Flats, and from it several dry ravines fall away to the east and southeast. The Pot Holes is the name given to the region of these ravines, the principal one of which is perhaps 1½ miles long and is called Fiege gulch. All of them fall into the Colorado. The prevailing rock of the locality is a dark blue and very hard granite, intersected with several dykes of basalt having a northeast and southwest course, and also with numerous small veins of white quartz, many of which are mere threads. The hill slopes (as might be expected) are steep and very rugged, very barren, and with but a slight cover of soil. But on both sides of the saddle, and in it, and wherever on the slopes bordering the ravines that fall away from it the rugged bedrock is level enough to hold soil, there gold can be found in pockets and streaks and strata. Some spots have yielded hundreds of dollars for a few hours' work; others have produced 50 cents to $1.25 per day for years. Every winter the locality is visited by a few days of torrential rain. After these are over, most of the spots already previously worked may be attacked again with favorable results. And so it has gone on from decade to decade.

At the Mouth of Fiege Gulch, on the Colorado River.

The mouth of each ravine has been filled up by successive overflows of the river to flat, triangular parks. At the upper ends of these, close to the rocky hill slopes, very many prospecting holes have been dug from time to time in the expectation of finding rich pockets of gravel on the bedrock. Some of these have been profitable and others have not. In most cases, the water seeping in from the river has stopped work.

Between June 15th and September 1st the hillsides and ravines are deserted, for human beings could not work in the fierce heat of that season; but during the balance of the year there are always a few score of men at work. As no water is to be had, a form of dry washer has been evolved in which the material is screened and shaken and fanned until the yellow grains are freed from the soil. The gold thus gathered is coarse and angular; probably most of the fine dust is lost in the tailings. What is saved has all the appearance of material that has traveled but a short distance, if at all. Perhaps as much as $10,000 a year comes from the district. This is not great, but as the industry has been alive there for 100 years certainly and perhaps much longer, the Pot Holes have claims for consideration. It is by no means clear whence is the source of the gold. Nuggets worth $10 to $20 are not uncommon; a few are found each year. But the bulk of the output is in grains, many of which under microscopical examination prove to be parts of crystals. The metal brings $18.25 to $18.60 per ounce at the mint. A dredger is now being built at Yuma which will explore the mouths of the Pot Hole ravines.

Mine Blasting.

Written for the MINING AND SCIENTIFIC PRESS by L. J. SAFLEY.

The first requisites are good materials. The fuse should be cut somewhat according to the number of holes fired; for instance, for six holes, cut fuse from 21 to 36 inches, lighting the long fuses first and so on down. If one hole or more is intended to break first, cut fuse for the same somewhat shorter than the one intended to fire last.

A good quality of fuse burns about 18 inches per minute. Cut fuse somewhat with a rolling motion so it will be straight across; then pull the end cut between thumb and forefinger so such will be a little smaller on end. This will then enter the cap with facility, first noticing that there is nothing in the cap except fulminate of mercury, in a paste-like form, with glue or mucilage to hold the same.

To hold the cap on, if not already tight, take the shank of a pocket knife and press on cap just where the fuse protrudes from it, being careful not to molest the other end with pressure, as there is more danger with cap than powder and as much strength or more for same quantity. If such is intended for a wet hole draw the fuse through the hand, with some tallow or common rosin soap in it, being careful to get some at mouth of cap, there rubbing some in alongside of fuse.

This being done, prepare primer by opening the end of cartridge and forcing a hard, sharp-pointed stick the size of fuse or little larger down in the center of powder, somewhat longer than cap, then placing the cap in the aperture with gentle force so it will be covered by powder, doubling the end paper back as conveniently as you can or tie string around the same, closing powder up to the cap, making it more impervious to water. This being done, cut off a part of stick of powder if you do not want to use all for a primer.

Next, having the holes clean of mud with spoon or swab, know the length of hole; cut one or more sticks lengthwise, tamping one or a part at a time in hole until you have enough to use; then place the primer down on last tamped and pour some loose dirt, then tamp again, holding on to fuse, being careful not to pull cap out of powder. Do not use a tamping rod too large and especially not one of metal such as iron or steel.

The hole being tamped full, it is now ready to blast. The fuse sticking out several inches, split end and hold lighted candle underneath far enough to light and not be put out by fuse sputtering. Then skip!

In charging deeper holes it may be necessary to spring them. This consists in hole, say, 16 feet deep in hard rock, of putting one or more sticks of powder down and dropping a primer on the same with an 18-inch fuse lighted. This has a tendency to make a pot hole at the bottom, and if not satisfactory the first trial, to be repeated until space is large enough, taking care after each trial to clean hole and wait until there is no fire; if doubtful, use a little water. The idea is to get most of the powder together and well confined, as by doing so it will do better execution.

Then start to load as previously stated, using 6 feet of fuse or more and loading hole to within 5 or 8 feet of surface, or according to judgment. If several holes are to be shot together, better give all the holes the same preliminary treatment and shoot all at once, cutting fuse according to firing. A hole that length and sprung that way will take about seventy sticks of powder and should be well tamped; taking knife and splitting sticks will facilitate some. Giant powder will generate about 6000° F. on being fired.

It is a matter of conjecture if stick containing primer or cap should be down any great depth in powder that is tamped, as it might set the same on fire from fuse before exploding cap and powder.

Any number of holes may be shot on surface by doing as directed (without battery), viz., splitting fuse on end and placing giant powder in the same with a little pressure so it will stay until lighted. Then build a fire so as to get some fire brands; with one, or more, light and scoot out for safety.

Mica Mining in India and the United States.

Several varieties of mica are found in India, especially in Behar and in the Northern Circars. It readily splits into transparent elastic flakes, and consists of nearly equal parts of silica and magnesia and about 6% lime. Slips of mica afford a convenient substitute for platinum foil in chemical experiments on the effect of heat on organic bodies, and they are useful for covering photographs. Mica occurs usually in thin tabular plates or scales, resembling glass. It is rarely crystallized in four or six-side short prisms or long-sided pyramids. It melts before the blowpipe into a greyish spongy glass; it is soft, pliant and easily scratched; its colors are white, yellow, brown and black; specific gravity, 2.654. In China mica is used medicinally. In the Northern Circars mica mines are to be found in the upland valleys of the Godaveri, Kistna and Vizagapatam districts.

The principal mica mines of Behar are situated on the northern face of the Vyndhia hills, where the three districts of Behar, Monghyr and Ramghur meet. The most westerly mine is 37 miles southeasterly from Gya, in the district of Behar; the most easterly, 60 miles distant in Monghyr, the whole of the intermediate 60 miles being more or less productive of the mineral.

In the Northern Circars, as elsewhere, the mica reaches the surface in three different states, viz., the good, hard and serviceable mineral; the soft, wet, flimsy mineral, and the chipped and powdered mineral. The tests as to whether the mica is good for anything, or whether, as the natives say, "it is alive," are its firmness, its specific gravity and the power of reflecting the countenance free from contortions, the last showing the perfect parallelism of its individual plates and consequent likelihood to split well. The heavier the mineral and the more perfect the reflection the more valuable is the mineral considered. All the plates not standing the necessary tests are of a soft and flimsy nature, without any of the brilliant sparkle of the better sort. The natives call this the "dead mica," and it appears to be in a state of decay.

The plates of the superior kind are used in all the large Gangetic cities and towns by the native draughtsmen, by the lamp and toy makers, by the Mohammedans for ornamenting their taziahs or taboots, for ornamenting boats and umbrellas, and making artificial flowers. The second and third kinds are pounded and used for ornamenting toys, pottery and the inside of houses, for sprinkling over cloths and turbans, the sparkle from which by torchlight resembles diamonds; but the great consumption of the inferior kind takes place during the Hooli festival, during which period the "abir" or pounded mica, mixed with flour and some red coloring matter, is freely sprinkled over the votaries of those bacchanalian orgies. It is the soft, shiny, scaly part of granite and is liable to decay from constant damp. It passes into a greasy or soapy earth or loam. Mica is mixed with lime to form a glistening plaster for native buildings.

The mode of opening a mica mine is as follows: A small and convenient hill having been selected for commencing operations upon, a party of the wild hill tribes first propitiate the local tutelary deity by offerings of flesh and liquor. They then ascend to the top of the hill and commence sinking a series of pits, the whole way down the profile of the hill, about 3 feet in diameter each and a few feet apart. These pits are not continued vertically downwards, but in a zigzag shape, but nevertheless not so much out of the vertical proper as that a basket containing the mineral cannot be hauled up from the bottom of the pit to the top, the zigzag shape of the shaft being formed by sinking the shaft first inclining to the left a few feet, the head of each cut or notch forming a landing place or step, and thus the necessity of ladders is obviated, the projecting of salient angles of the notches forming a perfect flight of steps from the top to the bottom of the pit, which seldom reaches to a greater depth than 40 feet, when, darkness interfering with the workman's progress, the pit is abandoned and another commenced on a few feet farther down the hill.

A slight framework of faggots, cut from neighboring trees, is placed over the mouth of each pit. On this a man sits waiting till the signal from below is given to haul up the basket containing the mica and rubbish, which has been dug from the sides of the pit by the aid of a rude pick. On arrival at the surface the good and bad materials are separated, the earth and rubbish shot down the precipitous side of the hill. The good mica, which arrives at the surface of the pit in ragged masses about 18 inches in length and 6 inches broad and 3 inches in thickness, after having its ragged edges trimmed off with a reaping hook-looking instrument, is placed by itself in a heap, and the bad or refuse—that is, the softer kind—is also placed aside in a heap by itself.

Laborers Working in Mica Mines, Behar, India.

In the Northern Circars the mines are worked by native merchants and by at least one large European firm of Madras. In Behar they are worked by Mahajans or native merchants who reside at Patna. In northern India the excavators or miners are Bandatuis, or inhabitants of the hills, a race allied to the Kols, Bheels and Santhals.

The mines, both in Behar and the Circars, are worked during the months of January, February, March and April only, for during the hotter months the great heat dries up all the water for many miles around the mines, and during the rainy season the pits fill with water, and subsequent to the rains the unhealthiness of the dense miasmatic jungles in the neighborhood prevents the work commencing before January.

The accompanying engravings illustrate the primitive native methods of mining mica and preparing it for market.

In the United States, as previously noted at considerable length, mica is not uncommon, nearly every part of the mineral area furnishing deposits more or less profitable. In New Mexico the Standard Mica Co. operates a group of claims near the Denver & Rio Grande Railway line in Rio Arriba county. They are making regular shipments of mica to Denver and Cleveland. Last week 60,000 pounds were shipped. Its chief uses nowadays are for electrical purposes and for the manufacture of wall paper. The best mica for electric purposes is imported from India and from Canada, the latter being a bronze mica, which is much in favor in the industrial lines. Some of the mica shipped from New Mexico is used for electrical purposes, but the bulk of it is ground for the wall paper manufacturers. Occasionally a choice pocket is opened that yields a high grade of sheet mica, and this goes into the makeup of illuminated stoves and lamp chimneys. However, there is not much profit in this feature of the business, because of the care that must be used in handling the mica and preparing it for market, so that the best demand for New Mexico mica at this time comes from the wall paper people and the manufacturers of electric appliances. "We are in the market for good mica," says Supt. Fleming, "all the time, anywhere. If I could contract for 10,000 pounds to-day at $1 a pound I would be glad to do so."

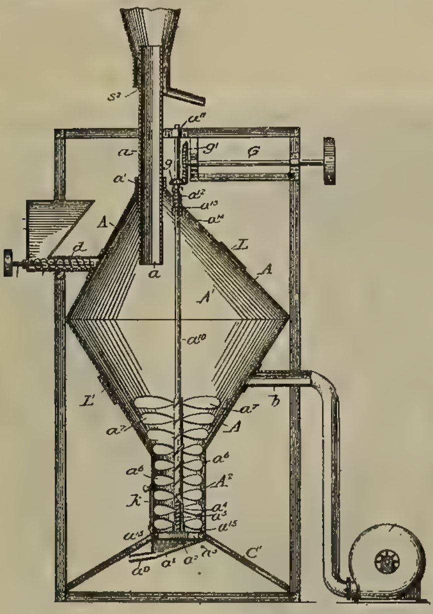
Trimming Mica for Market at Behar, India.

Mining and Metallurgical Patents.

Patents Issued August 28, 1900.

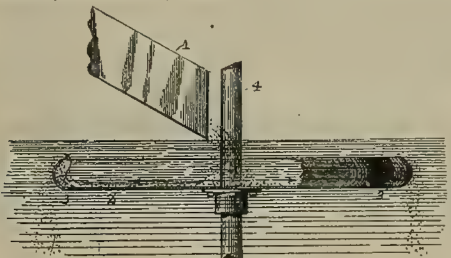
Specially Reported for the MINING AND SCIENTIFIC PRESS.

ORE CONCENTRATING AGITATOR.—No. 656,674; A. H. Stebbins, Little Rock, Ark.



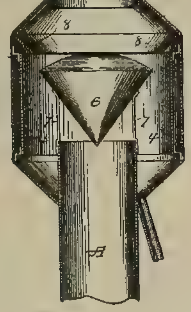
In an ore concentrating agitator, combination of casing having enlarged central portion constituting an agitating chamber, an exit pipe leading from chamber and extending thereinto, throwing device in lower part of chamber, feeder, air inlet for conducting blast of air into chamber below feeder and above throwing device and door in lower part of casing opposite throwing device, stud projecting upward from bottom of lower portion, shaft seated on stud, and carrying throwing blades fitted to lower portion, other throwing blades of larger size above reduced lower portion, and means for operating shaft.

PROCESS OF SEPARATING ORES.—No. 656,728; H. C. Robinson, Cincinnati, Ohio.



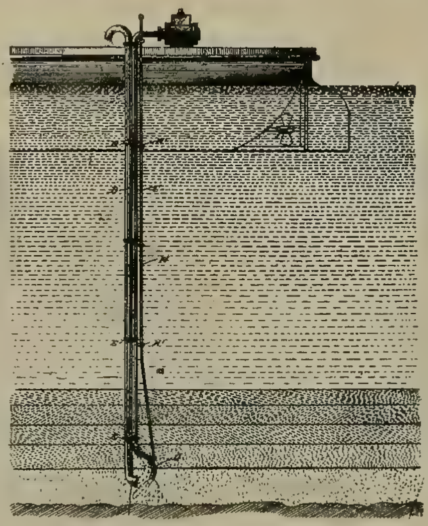
The process of separating heavier from lighter materials of conglomerate, consisting in rotating materials on submerged horizontally rotating surface at speed sufficient to develop centrifugal force only slightly in excess of that necessary to overcome inertia of heavier material resting on support whereby conglomerate is subjected to prolonged, but gentle disintegrating action by the comparatively still water by which lighter is lifted and carried off support, heavier gradually driven toward periphery of rotating support, soft bank of sand being maintained at periphery under which heavier material sinks and is then protected from currents tending to lift it off of support.

EXHAUST HEAD.—No. 656,989; F. Maranville and W. Warden, Akron, Ohio.



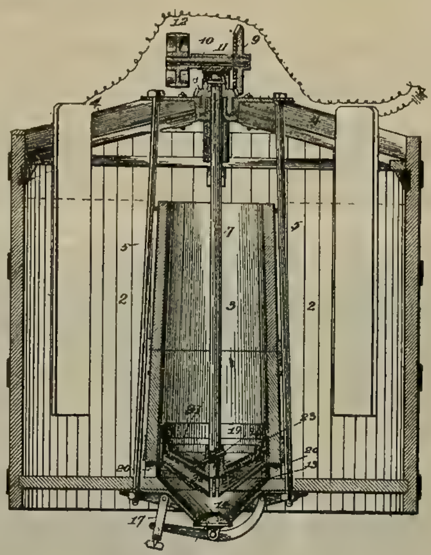
In an exhaust head, combination with casing and steam pipe projecting through and terminating above lower end of casing, of deflector or condensing wall within casing and spaced inwardly from wall thereof, terminating at lower end below upper end of steam pipe, inclined deflector ring overhanging annular space between deflector or condensing wall and wall of casing, conical deflector disposed over and supported by steam pipe, wall of conical deflector being approximately in line with inclined deflector ring, an outlet at lower end of casing.

APPARATUS FOR REMOVING MATERIAL FROM BELOW THE SURFACE.—No. 656,994; H. F. Munn, New York, N. Y.



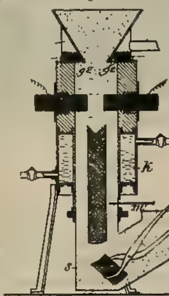
An apparatus for removing low or bedrock strata of material, comprising pump, pipe connected therewith, for forcing fluid under pressure by pump through pipe into material to be loosened, nozzle pivoted on lower end of pipe and under control of operator, adapted to discharge fluid under pressure into material to be treated, to loosen same, discharge pipe having an entrance mouth extending into material, nozzle being arranged to operate in conjunction with mouth, to force loosened material up through discharge pipe.

APPARATUS FOR ELECTROLYZING ORES.—No. 657,032; A. M. Rouse, Denver, Colo.



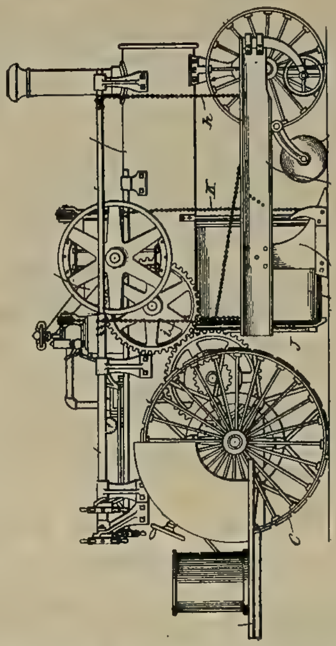
An apparatus having anode and cathode suitably arranged therein, combination of tank having outer compartment, tube located within tank having open upper end provided at lower end with communication from compartment, driving shaft projecting within tube, inner and outer cups carried by shaft and wings arranged intermediate of cups; wings carried by cup, outer cup carried by wings, discharge duct, valve arranged to close duct.

ELECTRIC FURNACE.—No. 656,930; W. Borchers, Aix-la-Chapelle, Germany.



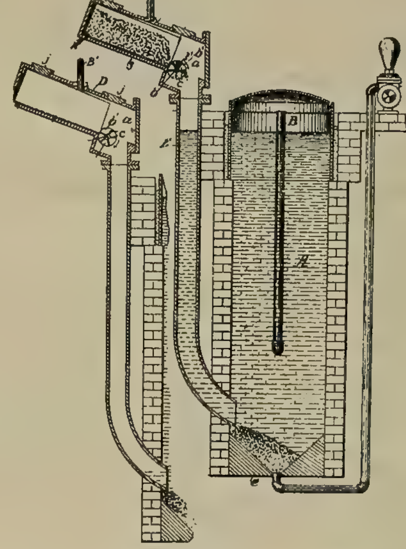
In an electric furnace, combination with downwardly extending furnace and oppositely disposed electrodes arranged therein, of water jacket on discharge end of furnace, toothed roller arranged transversely to discharge end of water jacket, conveyor for conveying off products fed thereto by toothed roller chisel movably arranged transversely in wall of furnace for breaking up carbid after it leaves roller and before it is discharged by conveyor.

AUTOMOBILE DITCHING AND GRADING MACHINE.—No. 656,715; M. G. Bunnell, Chicago, Ill.



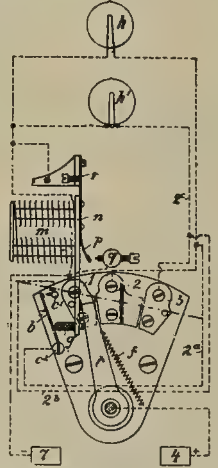
Combination of horizontal boiler mounted upon front steering wheels and rear traction wheels, plow arranged in advance of one traction wheel having beam extending alongside one steering wheel, bracket bearings secured to boiler projecting laterally therefrom, shaft and sleeve mounted in bearings provided with hand wheels, chains connecting shaft and sleeve with plow, draft connection between plow and forward running gear.

PROCESS OF MAKING ACETYLENE GAS.—No. 656,863; E. S. Titus, Hempstead, N. Y.



Process of making and purifying acetylene gas in first forming volume of acetylene gas within closed chamber which contains carbid of calcium, then passing carbid of calcium through volume of gas into volume of water at substantial distance below surface of water without passing carbid from surface of water downward, and collecting washed or purified gas from surface.

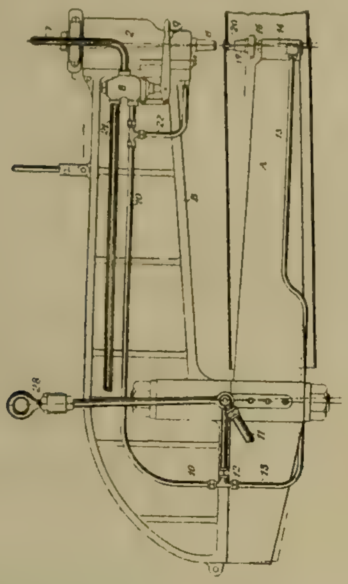
ELECTRIC LAMP FOR MINERS' USE.—No. 656,977; L. Horwitz, Berlin, Germany.



A miner's lamp, comprising two glow lamps, hand switch, battery, casing therefor, contacting strips for battery and casing, automatic switching device comprising electromagnet armature of which actuates contacting device switching in or out either lamp, contacting strips of battery and casing being so arranged that after each fresh charge of battery the latter may be placed in apparatus so that one pair of strips on battery comes in contact with different pair of strips on casing whereby direction of current is reversed and any residual magnetism in apparatus is neutralized.

◆

HYDRAULIC PLATE CLOSING AND RIVETING DEVICE.—No. 656,801; J. H. Batcher, Sacramento, Cal., assignor to Schaw, Ingram, Batcher & Co., same place.



Hydraulic plate closing and riveting apparatus consisting of suspended upper section having hydraulic ram and riveting tool, mandrel plate closing hydraulic pressure device carried thereby, rivet-heading tool concentric therewith, lever suspended between its ends having one end fulcrumed, other serving as handle, by which the parts are brought into line with rivet holes of pipe sections, valve actuating lever by which water is admitted to actuate ram whereby pipe mandrel and parts carried thereby are movable in unison with movements of ram to bring them into contact with interior of pipe whereby plates or pipe sections are closed together, rivet introduced and head formed thereon.

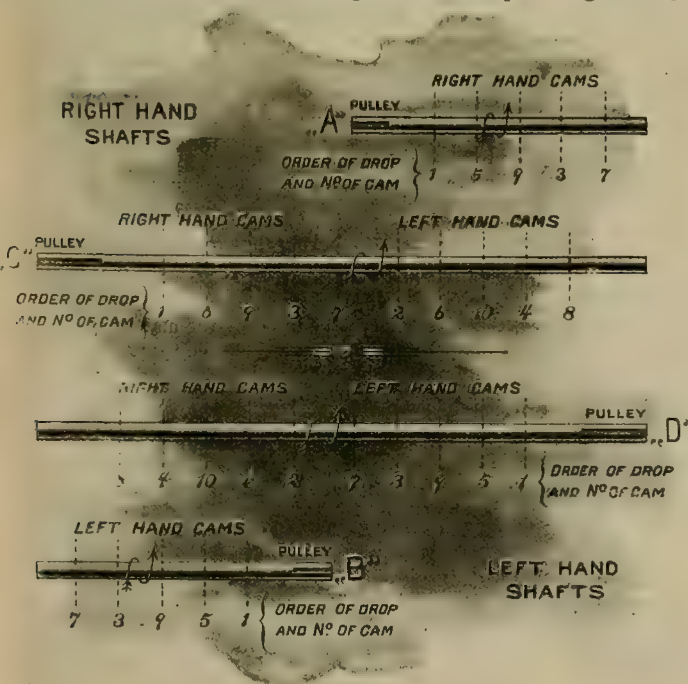
Cam Shafts and Cam Fasteners.

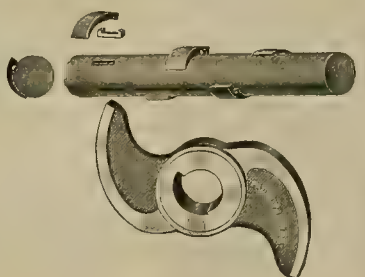
The Edward P. Allis Co., Milwaukee, Wis., furnish illustration of their system of right and left hand cam shafts and their method of numbering cams, the intent being to obviate any misunderstanding in the ordering of cams and cam shafts.

In a description accompanying the above cut, the Edward P. Allis Co. say: "The question of whether a cam shaft is right or left hand is determined by the location of the pulley on the shaft. A cam shaft is right hand when the pulley is to the left of the observer standing so that the top of the cam shaft revolves from him, and left hand when the pulley is to the right of the observer standing in the same position. By referring to the cut, it will be noted that shaft A for a 5-stamp battery is designated as a right-hand shaft. The cams on this shaft are all right-hand cams. Shaft C, which is for ten stamps, is also a right-hand shaft, the five cams next to the pulley being right-hand and the other five cams being left-hand. Shafts D and B are left-hand shafts because the shaft extends to the left of the pulley."



Right and Left Hand Cam Shafts.

Herewith is also illustrated their Reliance patent involute cam fastener, the use of which, it is claimed, makes unnecessary the carrying of a complete set of extra cams for repairs. The distinctive feature of this fastening is that, the wedge being involute, there is continuous full contact between the wedge and the cam. Another advantage claimed by the Edward P. Allis Co. in using this fastening illustrated is that all cams are alike and will fit any place on the shaft.



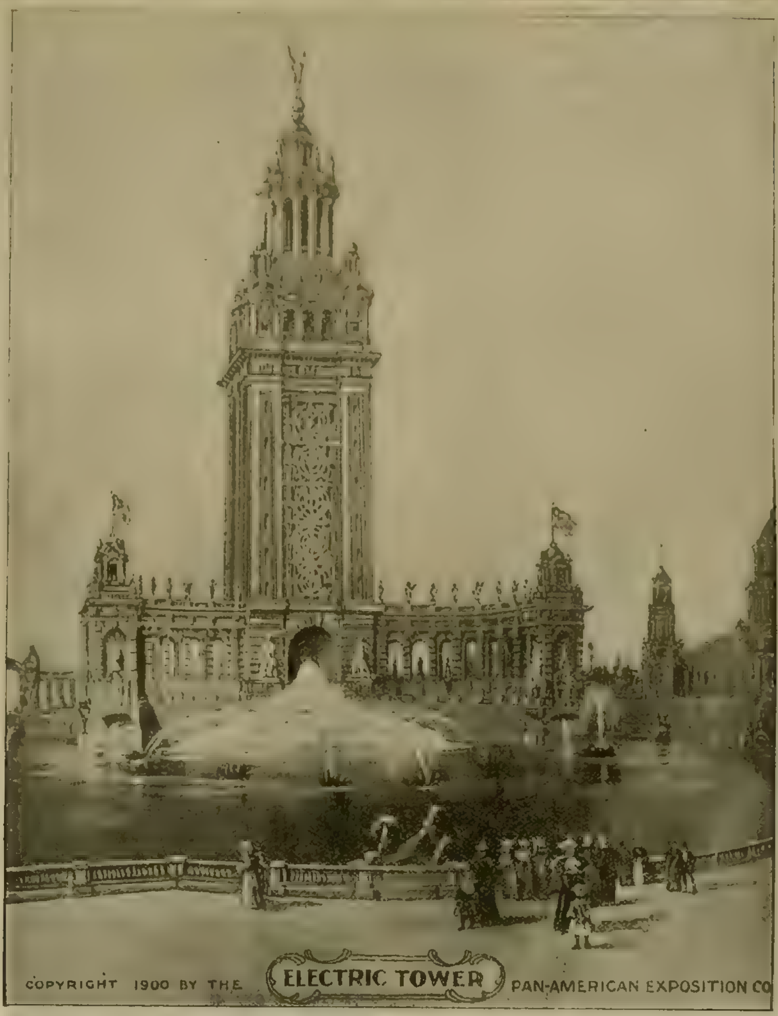
Reliance Pat. Involute Cam Fastener.

A Coming Electrical Exposition.

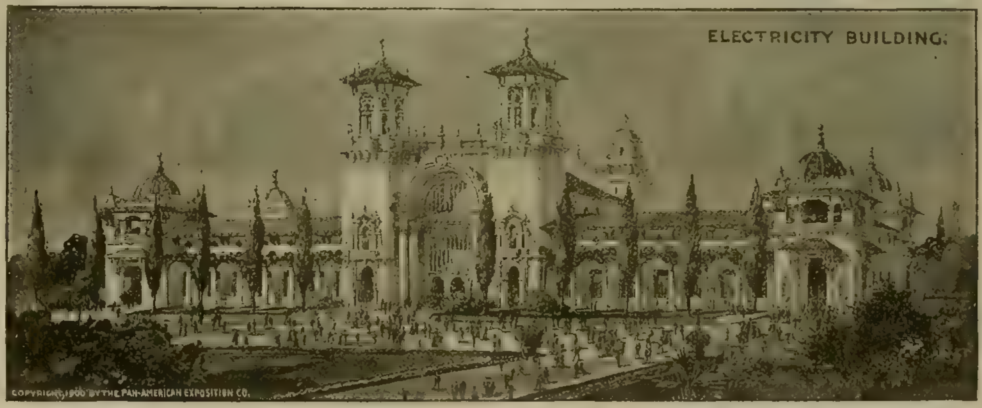
◆

The Pan-American Exposition at Buffalo next year bids fair to be rich in electric interests. There is particular reason why it should be. The exposition is but half an hour's ride from Niagara Falls, which has been put in harness by electric engineers and part of its immense power turned to industrial uses. On the American side there are two corporations utilizing the current of the Niagara river for developing electric power used in many industries at the falls. The power thus generated by one of these corporations is also transmitted to Buffalo, 25 miles distant, for use for the electric lighting of the city, for operating a great electric trolley car system and in many manufacturing establishments. The power thus transmitted will likewise be extensively used for the purpose of the Exposition.

There will be a special building, of which a picture is given herewith, which will contain displays of all kinds in the practical and artistic uses of electricity, together with complete exhibits of electrical machinery and appliances. The designs contemplate a handsome and commodious building, 500 feet from east to west, and 150 feet wide, giving an exhibition space of 75,000 square feet.



COPYRIGHT 1900 BY THE PAN-AMERICAN EXPOSITION CO
ELECTRIC TOWER



ELECTRICITY BUILDING.
COPYRIGHT, 1900 BY THE PAN-AMERICAN EXPOSITION CO.

A more conspicuous and popular feature of the electricity display at the Pan-American Exposition will be the Electric Tower, which will form the center piece of the whole affair. The height of the Tower, shown in the accompanying picture, is 348 feet above the surface of the broad basin in which it stands. The main body of the Tower is 80 feet square. From the surface of the water to the top of the colonnades is 75 feet. The shaft of the Tower is treated with great simplicity. The center of each side is paneled with fantastically perforated work, through which is indistinctly revealed the massive framework of the Tower. This feature is calculated to produce a remarkable effect when lighted from within. A spiral staircase within the colonnade leads to the stage of the Tower, the cupola, over whose soaring dome is poised the superb figure of Electricity, thus dominating the entire Exposition, which owes so much to electrical power.

From the water to the feet of the figure of Electricity is a vertical distance of 331 feet. The figure is 17 feet in height. The entire exterior of the Tower will be studded with myriads of electric lights, so arranged that a variety of effects can be secured.

◆

THOS. A. EDISON is reported about ready to make public details of his newest invention, a machine for the generation of electrical power without the use of engines and dynamos, said to approximate almost exactly the production of electricity directly from coal.

Some Further Mill Practice in Cyaniding the Silicious Ores of the Black Hills, South Dakota.

Written for the MINING AND SCIENTIFIC PRESS by JNO. M. HENTON.

Since writing the article on "Wet Crushing and Cyaniding the Silicious Ores of the Black Hills of South Dakota," which appeared in the MINING AND SCIENTIFIC PRESS of March 10th last, the mill of the Dakota M. & M. Co. at Central City, S. D., has been in continuous operation, with the exception of hanging up a day or two occasionally for some needed repairs. The method of wet crushing in cyanide solutions has been continued with such satisfactory results in economy of chemicals and percentage of saving of the greatest possible extractions that it would not be changed, and is regarded by the management as the best method of treating these ores. While the practice has been the same as indicated in that article, some changes in detail of operating have been found to secure a larger tonnage increase. The sands become too light to separate readily in the agitator, and the "V" box was introduced. This change proved of great advantage and made it possible to increase by one-half the amount of the ore milled.

Entrance to Gunnison Tunnel, B. & M. and Elkorn R. R. Elkhorn Engine Hauling Ore From Gunnison Loading Dump, Dakota M. & M. Co., Black Hills, South Dakota.

The ore pulp, coming from the batteries, passing a six-mesh woven wire screen, is delivered by the centrifugal pump to the "V" box, where a separation of the sands from the slimes is made by the principle of that device. The slimes are run from the "V" box to the agitator vat, where the slime particles settle and the clear solution is siphoned off and run to the sump ready to use again. The sands are run from the "V" box into the percolating vats, where, the drain cock being left open, the solution drains off and passes through the zinc box to the sump to be used again. All this is continuous until the sand vat is full, when the stamps are hung up and the slimes are treated by agitation, first cyanide being added to build up the stock solution, and then run to the slime vats, as described in the former article. The treatment in the slime vats is by means of a rubber hose connected with a pump, and to the other end of which is a 5-foot section of 1-inch gas pipe, by means of which the slimes can be very well washed. The sands are treated entirely with stock solution containing from one to two and one-half pounds of cyanide per ton of solution. It has been found, by many experiments of continuous work for weeks at a time, that just as good and quick an extraction can be made on the Gunnison mine ore with a solution containing one pound of free KCN as with a solution of greater strength. This is of much importance, as great economy in cyanide is thereby made possible. How much weaker a solution can be used has not been determined, as the present practice comes within the limits of reasonable economy in chemicals. The total consumption of KCN for the month of July was less than one pound per ton for the ore treated. No attention whatever is found necessary to the strength of the solutions in KCN in the effect on the zinc precipitation, as the results are equally good with all strengths.

It would be very interesting to know the form and combination of gold in this ore. Perhaps it will be possible to determine this in the near future. Samples taken for the purpose of determining the value of the ore milled were run through the assay office rock-breaker, and then the fines screened out through the twenty-mesh screen. The two samples thus secured assay the same value. Samples of the foam on the solutions flowing from the batteries have at times been found of double the value of the ore, and never been found of less value than the ore, the solutions carrying the foam having a value of only about one-fourth that of the ore. Precipitation suggests itself as a possible explanation, which might arise from the possible carbon in the ore shale, but there is no evidence of loss. Another strange fact is that the saving from the two products—the slimes and the sands—vary but a few cents from each other, and, one being known, the other can be closely predicted. The extraction from the slimes is better than from the sands.

The best method of preparing mill solutions by evaporation for assaying was recently made a matter of experiment in the laboratory of this company. Six samples were taken, each having a different gold value, and ranging from moderately rich to very poor, the latter representing the outflow from the zinc box. These samples were treated in six different ways. Ten assay tons were used in all, except the lead trays, in which two were used. All values are reduced to single assay ton values. The first assay of the first sample was run in duplicate and allowed to burn black to see if accurate results could be had in this way. The results were as follows:

Method.	No. 1.	No. 2.	No. 3.	No. 4.	No. 5.	No. 6.
Evap. rapidly without lith.	$ 7.30 4.00	.... $11.64	.... $4.90	.... $0.90	.... $0.24	.... Trace
Evap. slowly without lith..	12.60	11.68	5.46	0.72	0.24	$0.20
Evap. rapidly, lith. at finish.	14.40	12.30	6.30	0.71	0.24	0 90
Evap. rapidly with litharge.	14.20	11.70	5.80	0.88	0.20	Trace
Evap. slowly with litharge.	14.60	12.90	6.00	0.76	0.24	0.16
Lead tray......	11.00	11.60	5.30	0.75	0.30	None

Only such care was given as is practical in every day laboratory work, and the differences in results are just such as may be expected from following the method. The assays which check probably represent the true value of the solution. The variation from this check value, whether above or below, is probably due to imperfect cleaning of the pans in which the evaporations were made. The results seem to show that results sufficiently satisfactory for mill work can be had by any of these methods. In evaporating in the pans without litharge, care must be taken to finish on a square of asbestos paper, and without burning. Evaporating in pans with litharge at beginning gives the least trouble, and the use of the pan has the additional advantage over the lead tray that all errors are divided by ten, which quantity is not practicable with the lead tray. The flux used is the ordinary ore flux for a half assay ton, the litharge being omitted in such as it has been used in while evaporating. The pan is scoured—first being slightly moistened—with half the flux, and emptied upon the mixing cloth, and then a second scouring is made with the remaining flux. It is then run in a crucible, as any ordinary crucible assay. To determine how well this method cleaned the pans, the writer once took ten pans which had been poorly cleaned and recleaned them with an acid wash and assayed the washing, with the result of $11. As these ten pans had had 100 assay tons evaporated in them, the error amounted to an average of 11 cents, but these had been very carelessly cleaned, and it is not probable that the average error of the usual practice is more than one-fourth that amount. Such an approximate result is as accurate as the other factors of mill work can be made, and the labor is the minimum.

There is one feature in the mill practice of this company which should commend itself. It is the practice to hang up the stamps on Sunday. There is no more apparent reason why a quartz mill should run seven days in the week than a flour mill or a cotton mill, and these latter close for Sunday. J. M. Buckley, L. L. D., in the July Century Magazine says: "The observance of one day in seven by a complete change in subjects of thought, and the suspension of modes of activity required for six days, would be philosophical even though it had no basis in religion. In the French revolution the attempt was made to have a holiday once in five days, and again once in ten. The intervals were too frequent under the first plan, and did not occur often enough under the second. The superintendent of one of the largest hospitals for the insane declares that nineteen out of twenty of the business and professional men who come under his care have been in the habit of carrying business on their minds for seven days of each and every week." The men who are employed in quartz mines and mills are certainly as much in need of a weekly day of rest as any other class of men, and the business will as well adjust itself to the necessary arrangements and maintain a profit-making condition as any line of manufacturing.

In connection with the subject of cyaniding silicious ores, Mr. Henton sends three photos depicting some mining operations of the Dakota M. & M. Co., two engravings from which appear on the front page and one on this page.—ED.

Silver Smelting in Mexico.*

NUMBER VII.—CONCLUDED.

The bricked flue dust is an excellent material to make a furnace run fast, and is especially useful in smelting barrings and fine material like roasted tierras and roasted matte. But in most cases it has to be put on the ore charge to get it out of the way. If much of this material is on the ore charge, the weight of 1000 pounds can not be maintained, on account of its great bulk.

The work at the blast furnaces, steam engines and boilers and at the calciners is performed in two shifts of twelve hours each. All the other workmen, mechanics and ordinary laborers, work ten hours, or less if they are assigned a task (tarea).

There were employed on an average 612 men and boys a day, whose wages aggregated $641.90. Of this force, 32 were whites (Americans and Europeans), 2 American negroes and the balance of the Spanish-American and Indian races. The white men occupy all the prominent and responsible positions, as engineers, head mechanics, assayers and foremen; the negroes are the head firemen at the boilers, and were the only ones who could keep the steam up in the hot season. The Mexicans of the Spanish-American race fill the positions of under-foremen and mechanics; for positions of trust they are unfit. The great bulk of the workmen are Mexican Indians, who earn 37 cents a day as water boys to $1.75 as picadores. Considering what they eat and where they sleep, they work very well under proper supervision; but they are unsteady, and will leave en masse when the sugarcane is ripe and they can get work at a plantation. They are liable to stay away from work if a rain storm sets in shortly before a change of shifts, or if a sudden spell of cold weather occurs, or when the furnaces are running too fast in hot weather. They are apt to strike when they get a new foreman or even superintendent, or when their mode or character of work is to be changed. They even object to working at a new furnace if they suspect that their work will be increased thereby. These prejudices and superstitions will, however, gradually be overcome. Twenty years ago it was an impossibility to get any workmen at all in the "Semana Santa," that is, the week before Easter; at the present time it is possible to run furnaces during that period, although not at full capacity.

Like all people of low education, they are addicted to stealing in a small way if an opportunity offers, and this propensity is fostered by the many buyers of stolen goods who may be found in every Mexican market place. Bullion thefts were a daily occurrence for several years, until at last the Governor of the State suppressed a small smelter at Sta. Catarina, near Monterey, that subsisted entirely on stolen bullion and ore. Such parasites are met with in almost every mining camp of note.

The prevailing disease of the Mexican workmen is malarial fever; acute lead poisoning is rare, in spite of the indigestible food they eat and their aversion to ablutions; chronic lead poisoning is unknown. Accidents are, however, frequent, owing to carelessness.

The arrangement of the repair shops, as carpenter, machine, electrical, blacksmith and tinsmith shops, is adequate to the requirements of the smelter. The laboratory and assay offices are susceptible of improvement.

---

*Describing the Guggenheim Smelter at Monterey.

The various buildings composing the works are all constructed of wood and galvanized corrugated iron, painted on both sides with red iron paint or with graphite paint. In spite of these precautions, the iron is destroyed very rapidly by the action of the atmosphere, which is especially annoying in the case of the roofing. In California and Arizona a non-metallic roofing is now used extensively on industrial buildings, which is known under the name of "P. & B. ready roofing," and gives good satisfaction. The subjoined summary will illustrate the work performed during the year under discussion: Ore smelted, 183,230 Mexican tons, dry weight; ore purchased, 172,018 Mexican tons, dry weight.

COST OF SMELTING PER TON (ROASTING INCLUDED).

Coke	$2 50
Coal and wood	35
Charcoal	01
Limestone	05
Labor	1 28
Tools and supplies	20
Repairs	30
Ore sacks	09
Federal extraction tax	70
Bullion excess tax	16
Bullion taxes	12
Stamp taxes	10
General expenses	63
General agency expenses	11
New York office	21
Interest	02
Insurance	03
Total (Mexican currency)	$6 86

N. Y. exchange rate, $1.89⅝.
Average N. Y. silver quotation 67.05 U. S. currency, per ounce of fine silver.

AVERAGE ASSAY OF THE ORE SMELTED.

Silver..........37.04 ounces per 2000-lb. ton.
Gold........... 0.14 " "
Lead ....13.98%.

Cost of ore smelted, per ton	$44 09
Mexican tons of bullion produced	24,425
Silver in bullion and matte shipped	6,179,589 ozs. Troy
Mexican tons of limestone consumed as flux	14,594
Mexican tons of coke	34,408
Mexican tons of charcoal	281

The percentage of losses and gains is, of course, variable, and is kept secret by everv smelter. I can say this much: that in gold there is no loss—more generally a gain—on account of the accumulation of traces, which, as such, have no determinable value. Some smelters also make a gain in silver, which is due more to commercial than to technical skill.

Two more furnaces of larger dimensions than the old ones were erected and housed in a building constructed of iron and steel throughout. Two 475 H. P. triple-compound steam engines, two 150 H. P. marine boilers, 9 feet in diameter, and a number of blowers were added, and a third locomotive for hauling slag was acquired. According to communications from the designer of the furnaces, Paul Johnson, their section at the tuyere level is 44 inches by 144 inches wide. The water jackets forming the side walls have a bosh, and are 18 inches wide by 4 feet high; they have a tuyere opening in the center, and there are eight tuyeres in each side. The end jackets are straight and have no tuyere openings. Owing to the intense heat caused by the application of a blast of a higher than the ordinary pressure (2½ to 3 pounds per square inch), it has been found expedient to interpolate another tier of water jackets between the deck plates and the regular jackets. The side walls above the water jackets are also flaring towards the charge door, to such a degree that the area of section at top is twice the area of section at tuyeres. This is done in order to diminish the speed of the escaping gases and thereby the formation of flue dust. The exact height from tuyeres to charge door I do not remember; some informants give it at 20 feet, others at 25 feet. In the Raschette furnace the proportion of the area at the tuyeres to the area at the charge door is as 1 : 1½, and the height of the smelting column is 16 feet 5 inches. From this comparison it would appear that the principle of the Raschette construction is receiving deserved recognition and is being enlarged upon. It is claimed for these furnaces that the production of flue dust is very slight, and that the formation of wall accretions is greatly diminished. One of the new furnaces was put in blast in April of this year, and the second soon after. Their capacity was rated at 175 tons of charge in twenty-four hours; but, as is usually the case, no such figure was ever reached, 136 tons being the maximum of which I have heard. The cubic contents and the pressure of the blast are not the only factors which determine the capacity of a furnace. The increase of the furnaces in height has brought about a decrease in the consumption of fuel and the possibility of making a more acid slag, and, hence, of smelting more siliceous ore. The present consumption of coke, per ton of charge (exclusive of slag), is 12, as against 14 to 16 in the 14-foot furnaces. The slag is composed of: SiO_2 36, FeO 32 = 25 Fe, CaoO 18, not determined 14; total, 100. It carries 1½% of lead and 1½ ounces silver per ton, with bullion at 400 ounces.

The settling of the matte which flows from the furnace with a large current of slag presents some difficulties. The rectangular settler of the Orford form does not seem to have given satisfaction and has been replaced by a twin-pot settler. This is the old Colorado Iron Works twin-pot, with this alteration, that one bowl is elevated above the other sufficiently to allow the slag to overflow from the higher into the lower one through a spout. The elevated bowl is placed directly under the slag spout of the furnace, and catches the largest portion of the matte. The slag from the lower bowl overflows by means of a spout into an ordinary twin-pot, which is hauled away to the edge of the dump by a locomotive. After removing the twin-pots four times, the settling twin-pot is also hauled out and replaced by a new one. At a short distance from the furnaces the matte and slag are poured from the settler into smaller pots, and the shells are saved for resmelting. The waste slag twin-pot is emptied as usual, but the shells are dumped into a separate place for further treatment, as they run just as high in lead and silver as the shells from the small slag pots, in spite of the double settling. This system of matte settling is rather complicated and will be superseded, I understand, by settling in a reverberatory furnace, as at the Arkansas Valley Works, Leadville, Colo., and the El Paso Smelting Works, Texas. This reverberatory furnace is designated as a "separator." From latest accounts I note that all the 42x120-inch furnaces are to be replaced by the 44x144-inch size, and that the blowers are being broken up to serve as desulphurizing flux on the charge.

The Small Gas Engine.*

It would seem one of those rigid, but withal, just laws of nature that each new creation of man shall have its own sphere of usefulness, squeezing up the spheres of some of its older companions, modifying those of others, but completely crowding out none. Of the available powers for doing work, man, animal, wind and water powers have gone along peacefully for ages. Each has filled its place without puff or bluster, and probably will do so for ages to come. Of the more modern powers, steam, electricity and gas, what a zealous, wiry lot they are! Each would make good his position in this world by a revolution heralded by a million printer's ink trumpeters, but as the rank and file contains only his own offspring (decidedly immature in all cases) the initial skirmishing is soon over with, the newcomer being compressed into a very small but proper sphere to begin his last but continuous campaign, during which he will reach a position just so high or important as he is capable of maintaining and no higher. This triangular competition has been on for some years, and it may be of interest to examine somewhat the relative status of the participants as indicated in the title of this article.

The small gas engine may get its supply of energy either from a gasoline tank or from the gas main, while the electric motor has but one source, the electric main.

As to the cost of power from these three sources, if we take into account only the actual horsepower developed by each under fair to good conditions, putting aside all other considerations, under the present ruling rates for these forms of energy the gasoline would come first, the gas engine second and electricity last.

But power alone is not what is wanted by mankind, but that power applied. A 1000 H. P. engine is worth thousands of dollars to run a steamship, but is not worth 2 cents to run a coffee mill. In other words, power is of value only as it is applied, so that it is the relative cost of the power as applied that we must consider and not that of generation alone. Let us consider, then, such properties of construction and operation of the gas engine and electric motor as would seemingly effect the ease of applying the power which they generate.

Briefly, the working parts of small gas engines (and large ones as well) are supported either in a horizontal or vertical position on a comparatively heavy base or bed plate. The principal part consists of the cylinder, into which is drawn an explosive mixture of gasoline vapor or gas and air, which mixture is then compressed and ignited, creating a pressure which acts upon the piston, driving it forward. The external parts, with the exception of the admission, exhaust and ignition mechanisms, are so arranged as to convert the reciprocating motion of this piston into motion of rotation, the same as in the so-called trunk steam engine. So far we are in a well beaten track. It is only necessary to proportion these parts properly to have a well-behaved piece of machinery which is easily understood and easily managed.

Not so, however, with the other parts mentioned. It is probably safe to say that practically all failures or difficulties with small gas engines arise from faulty construction or lack of proper adjustments in the parts controlling the three operations of admission, exhaust and ignition.

It is not necessary at this point to explain the construction nor to detail the possible ailments of these parts to substantiate the statement that the mechanism included by these three heads is not at all easily understood, especially as to the results of their action upon the good or bad working of the engine.

But the fact that this mechanism is not readily understood is not of itself a serious feature at all. We who are interested in mechanical affairs expect to make such efforts as are necessary to gain at least a working understanding of the machines that come under our care, else how void of interest the great mass of our work would be.

But the real question is: when once this mechanism is understood, will it prove reliable? That is, when put in adjustment by one thoroughly understanding the engine, will it remain that way?

The Corliss valve gear is far from an easily understood piece of mechanism to one who has never placed a moment's thought on it until he meets it as part of a machine, which he must operate, but this is counted as no objection to it, for it can be understood, and, when once properly set and adjusted, is exceedingly reliable.

Judged from the standpoint of any form of the steam engine or the electric motor, these parts are not reliable in the sense mentioned, and there is nothing in either the steam engine or the electric motor which corresponds at all to them in this regard. It must not be inferred from this fact that the modern small gas engine is an unreliable motor, for it is not. But this does mean that it must receive attention and be accessible in a way that is not at all necessary with small electric motors.

The other points that should be mentioned here are as follows: In all makes of small gas engines there is but one impulse, acting on the piston in one complete revolution, and in the majority but one impulse in two revolutions, which necessitates a very heavy fly-wheel, and which results in a rather unsteady motion. Again, they are not readily started under load or otherwise. They can not be reversed and if loaded beyond their capacity will stop.

Unlike the gas engine, the electric motor is so well known in its construction and operation that it will only be necessary to point out the things that should enter into this discussion.

There are three materials entering into the construction of an electric motor, iron, copper and the fibrous materials used for insulation. This insulation is, in all forms, weak mechanically, but the enormous amount of experience which has been accumulated has made it possible to so introduce and protect this comparatively frail material that there is no mechanical weakness from this source. Motors will not stand moisture, however, unless especially built to do so. On the other hand, they give rotative motion directly, with but one moving part, they will start readily under any load up to full load and run with an almost fixed speed, with no impulses of any kind. They can be run in either direction and if properly designed will, for short intervals, stand overloads much in excess of their rated power. They can be run in any position whatever and can be set up, changed or removed in a very short space of time.

In all the good makes they are self-oiling and the absence of exhaust valves of any kind is of great importance in any small motor.

Where then is the place to put the small gas engine with reference to the small motor? Or, to put our question in another form (since the small gas engine is practically the newcomer), can the gas engine, in general, place a part of its sphere within that of the small electric motor? Let us sum up.

Gasoline is universally obtainable, electricity only partially so. This means there are thousands of small shops where the small gasoline engine has the entire field to itself. It is far superior to the small steam engine for such places, and so long as current is unavailable there can be no competition with electric motors. Absolutely constant speed is not at all necessary in this field and there is no question but the gas engine is here giving splendid satisfaction.

Next comes the same kind of a situation with the addition that current is available. This would include all kinds of small shops and places where small powers are used in cities and fair sized towns. Here the inflexibility of the gas engine as against the extreme flexibility of the electric motor comes into striking evidence.

Floor space is valuable. As a result the motor goes up on the ceiling, wall or an odd post. On a large job some distance from the shop it would save money to have a power tool or two at the building. Down comes the motor and in an hour is up again on the other side of the city. It is started and stopped with the machines, and if every advantage is taken of the flexibility available small individual motors will be placed on each machine, doing away with the use of shafts, pulleys or belts external to the machine.

Here enters in the plainest possible way that question of cost of power delivered at the machine. In cases where a few machines are run intermittently, but frequently, necessitating the running of a gas engine continually, the motor can readily compete in cost of power on account of the fact that the motor under the same conditions can be stopped and started as power is required.

The direct attachment to the machine of the power to run it opens up an exclusive field for the small electric motor, which, from all indications, is as free from intrusion as that of the small gas engine where current is not available.

In the intermediate field where both powers can be used, circumstances and taste will influence very largely which will be decided upon. If cost of running alone is considered the gas engine will be selected. If extreme regularity as to speed, or reliability without systematic inspection is required, the electric motor should be selected.

---

*A. R. Curtis in the Engineer.

Or again, if absolute independence of external sources of power is required, together with reliability, decide on a reliable make of gas engine, spend a small amount of time to systematically inspect the same, lay in a sufficient supply of gasoline and your independence will be complete and secure.

We conclude then that the small gas engine has created a field of its own in which it seems quite secure. Also that it has intruded and can intrude but little upon the broad sphere now firmly established by the small motor.

Keeping and Indexing Notes.

Written for the MINING AND SCIENTIFIC PRESS.

The keeping of notes is generally recognized among engineers as of great value, and, though attempted by many, is often given up, sometimes through the lack of a little perseverance, but more often because the system adopted does not meet the requirements. The ideal system permits of keeping and classifying notes in whatever form they are obtained—whether as personal memoranda, clippings, sketches or photographs. They must be indexed according to subject; must permit of easy reference; should not be too bulky; all notes relating to one subject should be together, and, finally, it should be possible to discard obsolete matter, or matter that is no longer of use to the engineer with his increased knowledge and experience.

Note books, with notes often accompanied by sketches, furnish a fairly convenient form, but the entries must be made consecutively, and not according to subjects. This makes indexing rather difficult, and may scatter information on any given subject through half a dozen books, which greatly impairs the usefulness of the system for reference purposes. Moreover, no convenient provision can be made for clippings, and they must either be copied or provided for separately. The same applies to photographs, which often serve to preserve a useful idea or suggestion.

The following system has been tried by the writer and has proved a success. It is simply an adaptation of card catalogues, which have lately come so much into vogue for similar purposes. The requisites are a box of catalogue cards, such as are now made a specialty of by many office supply houses; a note book with detachable leaves, preferably ruled in the same manner as cross-section paper, and a package of large envelopes. Even better than the latter are pieces of letter paper, cut to about 8½ inches square. By folding these in the middle, there results a package 4¼ inches wide by 8½ inches long, which I find a very convenient size. They are held together by a rubber band.

The envelopes, or folded pieces of paper, are now numbered on the outside consecutively near the top, and on each one is placed the heading under which its contents come, with such sub-headings or notes as may seem necessary. For example, we might have the following:

No. 1.—MINING, COSTS.—Bullion mine, Excelsior mine, stoping; John Bull mine, shaft sinking.

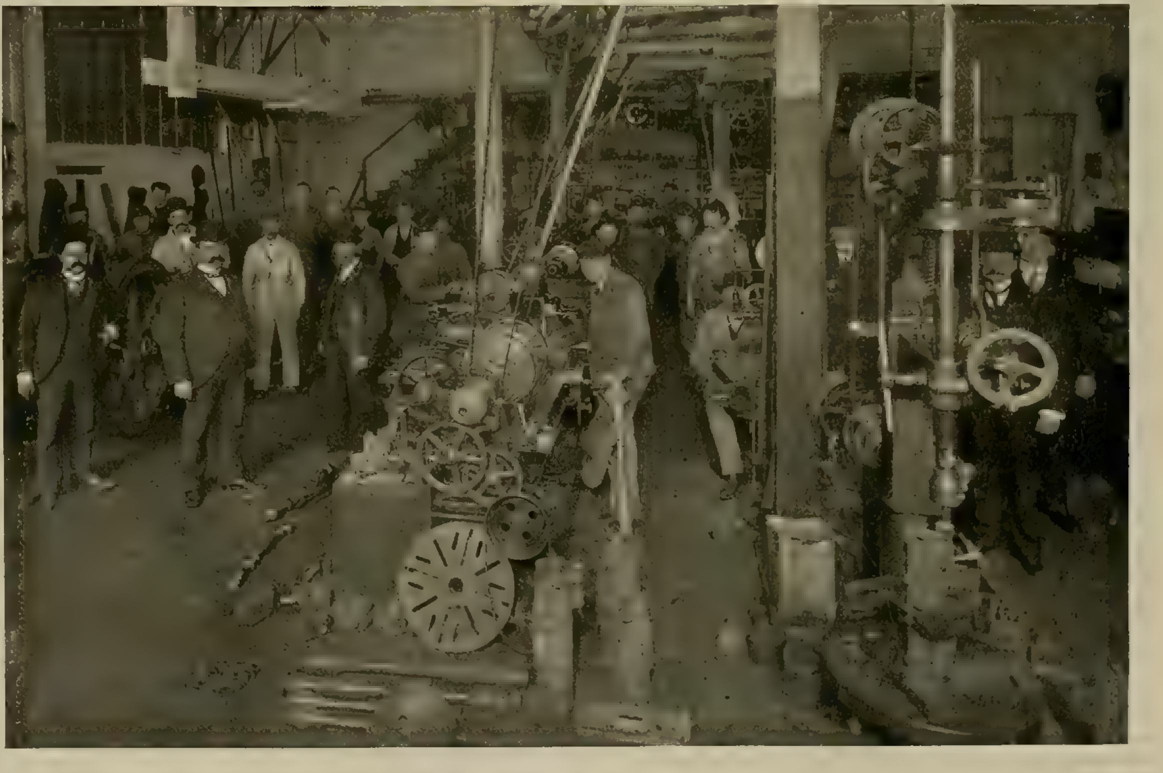
No. 2.—POWER, COSTS.

No. 3.—DYNAMITE.—Handling; composition.

Notes on the different subjects are slipped into the corresponding envelopes, entries are made on the cards as follows: MINING (to be written on the top line in the middle of the card), and COSTS (on the same line, but near the right hand edge), and then below. Notes on the cost of mining. See No. 1. And in the same way with the other subjects.

Since it very often happens that the cost of power depends on the amount of fuel used, the information might be sought for under the heading "FUELS." It is therefore best to put this heading on a card, and under it to write: Fuels, consumption of, etc. See under Power, Costs, No. 2.

For the same reason, one card is headed "DYNAMITE" and another "POWDER," but both will refer to the same envelope. As a rule, one heading will suffice, and it is seldom that more than two will be necessary. It is true that one objection to be urged against this system is that there will sometimes arise a doubt as to what heading an entry should be classified under, but the above method of double indexing will in a large measure remedy this trouble, and to this may be added the suggestion that it is usually better to classify under headings with a broad scope than to go too much into detail. For example, it is better to have one envelope for "ASSAYS," rather than to use a separate envelope for notes on the assays of each individual metal. Also, to occasionally look over the notes and to familiarize oneself with them, will make reference to them easier and will increase their usefulness.



A San Francisco Workshop Interior.

With each entry I think it very advisable to give its source. If a clipping, give the periodical from which it is taken, with date or number of the issue. If a personal memorandum, sketch or photograph, state when and where made, and give the authority for any statement included. It is then possible to know what weight to attach to the notes when they are made use of long after having been collected, and when the precise circumstances of each case may have been forgotten.

Short entries can oftentimes be advantageously placed upon the cards themselves. If in the form of short clippings, and folded papers are used instead of envelopes, it is well to attach the clippings by means of mucilage, otherwise they may easily be lost. With long clippings there is little danger of this.

Few, if any, men are interested in all branches of mining, or of any of the other engineering professions, and it is generally better for a man to confine the notes he collects to those relating to things in which he is interested, and not to include notes on subjects in which there is only a possibility that he may be interested in the future. In this matter every man must draw the line for himself.

The advantages of the system are manifest. It is compact, yet provides for all kinds of notes, and of various forms, and the information desired can be easily found. The one source of information is the box of cards, and it is found either on the cards themselves, or they refer to an envelope which can be quickly picked out by number. Everything is indexed according to subject, and all data on any one subject are to be found in one place, and not scattered. The system may be expanded to include an index of magazine articles, by subject and titles only, but this is of doubtful value. What is wanted is information that is available on the spot, and a list of magazine articles is seldom of use unless a library is within reach. If a library is near at hand, it is easy, when the occasion arises, to look over the files of the magazine, a task that is much facilitated by the index that most magazines print at the end of each volume. An index of books is of greater value, and less bulky. Wherever a man is, he can almost always send for a book. The cards should be arranged according to subject, and, if possible, should give author, title, name of publishers, size, edition, date of edition and date of entry, pages and price. It is true that many publishing houses issue lists of books, both of their own publications and that of other houses; but the lists are seldom all inclusive, and if a man sees or hears of a book that he is likely to want, it is better to make a note of it at once.

Zacatecas, Mexico, Aug. 20.

A San Francisco Workshop.

The accompanying engraving is a good interior view of the workshop of the Compressed Air Machinery Co., 11–13 First St., San Francisco, Cal., a concern that manufactures various devices used in the mining and mechanical world. The company has for years been making a specialty of the manufacture of the Giant rock drills and Giant air compressors, having opportunity to see the practical operation of their machinery in the mines on the Pacific coast, and make such improvements from time to time as suggested by their observations by practical miners. Their shop presents a busy scene, and steady demand exists for their machinery. They are filling orders for their machinery for mines on this coast, and have a demand for foreign trade, shipping to Mexico, British Columbia, Alaska, Australia and to some Eastern points. The Giant baby drill, which has attracted so much attention, is manufactured by The Compressed Air Machinery Co. They are the owners of patents pertaining to this class of machinery, and furnish information and estimates to those desirous of purchasing.

Paris Fair Awards.

Following is a partial list of awards to the State of California and California exhibitors. The grand prize is for products of mines and metallurgy:

GRAND PRIZE.

G.	C.	Name.	Address.	Exhibit.
11	63	State of California	Sacramento	Mines and mining
		GOLD MEDALS.		
11	63	New Almaden Q. M. Co.	New Almaden	Quicksilver
11	63	Cal. State Mining Bureau	San Francisco	Gold
		SILVER MEDALS.		
11	63	Pac. C. Borax Co.	San Francisco	Borax
11	63	D. Fricot	San Francisco	Gold specimen
11	63	F. Beaudry	San Francisco	Gold nuggets
11	63	Calaveras M. Co.	Calaveras Co.	Gold ore

Electricity in Various Things.

During a recent discussion at a meeting of engineers where boiler explosions were under discussion, the point was brought out that electrolytic action played some part in boiler explosions. One of those present gave his experience as follows:

"I had a novel experience in the gas plant of the San Jose Light & Power Co., which is not near the electric light works, and there are no lines which could bring in any electricity. Holding my hand near a leather belt a flame would come out near the knuckle. Go under a belt and you can feel your hair raised by frictional electricity. If you go on top of a boiler and put your knuckles near the drum you will see a blue flame. Your hand could not actually come into contact with the boiler because it was hot."

Another added: "There is no question but that static electricity may exist in anything under certain circumstances." While another said: "I have noticed practically the same thing under different circumstances. You cannot touch any of the wires of a transmission line in a great rain. In repairing you have to work with rubber gloves even when no machines are running."

"It is a well known fact," said a listener, "and probably familiar to all of you, that in those meteorological tests where experiments are made by flying kites in order to get observations in the upper air, they have to ground the piano wire which they send up. Otherwise they would get a current of electricity strong enough to knock a man down. The same thing occurs in building large steel vessels. They have to run a rod to the ground to carry off the electricity."—American Manufacturer.

MINING SUMMARY.

ALASKA.

The U. S. army transport Lawton goes on a relief expedition to Nome. About 600 extra berths are installed. She may make two trips conveying the sick and destitute people who are stranded at Nome.

Juneau Record-Miner: H. Hile, manager Last Chance G. M. Co., says the actual work in the basin is 815 feet of tunnel, 6x7 feet. The upraise will reach the gravel of the basin. In addition 2700 feet of flume, 4 feet 8 inches square, have been built, and an overflow flume 2180 feet long. Total length of main flume from dam to bulkhead 4160 feet. Wing dams will change the course of Gold creek from the south to the north bank of the basin. From these wing dams a new channel will be dug 1600 feet and from the end of this 300 feet of flume, 12x4 feet, will pick Gold creek bodily up and discharge it again into the old channel just below the bridge. This flume will be built on a 4% grade.

The steamer Humboldt reports a rich placer strike on the Chistochina river, one of the northern tributaries and formative branches of the Copper river. The diggings are 200 miles from Valdez and 240 miles from Eagle. This ought to give the transportation companies a few more to be carried north, and later carried back at government expense, though it comes somewhat late in the season.

ARIZONA.

COCHISE COUNTY.

The Dos Cabezas Con. M. Co. has an ore body 6 feet wide, assaying 25% copper, $350 silver and $25 gold per ton. The company will erect reduction works.

COCONINO COUNTY.

In the Buckskin mountains the new Nebeker fifty-ton stack smelter is running; the heavy machinery was hauled 200 miles from Belknap. The smelter is turning out bullion copper.

The sale is reported of the Central Arizona M. Co.'s property to Eastern men for $100,000. The property is in the Grand Canyon district, 40 miles north of Williams.

GILA COUNTY.

Development work has been resumed on the copper mines at Troy. T. Kavanaugh, foreman.

MOJAVE COUNTY.

Mineral Wealth: C. Gracey will erect a 100-ton stamp mill to treat the ores of El Dorado canyon, Nev.——The work of retimbering the main shaft on the Tennessee has commenced. The fire destroyed the timbers to a depth of 150 feet.

PIMA COUNTY.

On the Panama mine, in Old Hat district, J. D. Burgess has sunk a double-compartment shaft; the ore assays 213 ounces silver, $11.40 gold, 8 ounces copper, 39 ounces lead.

The Bradford mine, at Bloxton's, on the N. M. & A. Railway, is shipping to smelter copper and silver ore; F. W. Meade is Supt.

Breen & Peck will put a locomobile line between Nogales & Tucson; also, between Nogales, Washington and Duquesne camps.

PINAL COUNTY.

Supt. Blair of the Mammoth-Collins mines and mill, near Florence, finds increase of the water inflow in the lower levels, which necessitates an increase in the capacity of the pumping plant.

SANTA CRUZ COUNTY.

Wieland & Jund are shipping ore from the Lead Queen mine, near Harshaw.

YAVAPAI COUNTY.

Jerome News: The Brookshire group has a 34 H. P. gasoline engine at work. Supt. Treadwell is taking interest in road building.——The cyanide plant at the Copper Chief property, on Equator hill, is nearly completed. The ore will be roasted: capacity of plant, forty tons per day.——Men are developing the Iron King under the superintendency of W. E. Edwards.——Col. Bosworth, Pres. of the Verde Queen C. Co., has gone to New York; development is being pushed. Dr. King is in charge.——Gradually the copper miner is encroaching on the gold district of Cherry creek.

YUMA COUNTY.

The Crosby-Ehrich syndicate of Colorado Springs, which recently purchased 2000 acres, is building a dredger, with a capacity of 4000 yards per day, that will cost $50,000, to be towed to Pot Holes. The company is also prospecting its ground with a drilling machine.

The Colorado River G. D. Co. is making an examination of 10,000 acres at the junction of Yuma Wash and the Colorado river.

Arkansas men have a bond on 500 acres of dredgable placer land in the Laguna district, owned by the Y. C. R. G. D. Co. The prospective purchasers have thirty days to examine and prospect the ground: the bond calls for the payment of $20,000 in various installments. Prospecting has begun.

F. M. Barnes of Poncha Springs and other Colorado men are examining a tract of 40,000 acres above The Needles.

The Advance Gold Co. has launched its barge at Yuma and is putting in machinery. It will be completed in October and will cost $40,000.

The Cuchan G. M., M. & D. Co. is prospecting with steam power drills 640 acres of placer ground, to determine the character of machinery necessary to work the property.

CALIFORNIA.

AMADOR COUNTY.

Dispatch: Near Ball Rock, in Pioneer district, the ledge shows 14 foot wide, mostly quartz; average value $5.40 per ton.——The Defender mine, in Pioneer district, is a monthly gold producer. The Belmont discovery may outrival the Defender.——The Keystone mine at Amador City is operating forty stamps.——The South Spring Hill mine at Amador City is being worked by Supt. J. R. Tregloan. Twenty stamps of the South Spring Hill mill are crushing rock from the Lincoln mine for Supt. Voorhies at Sutter Creek.——At the Bunker Hill mine, near Amador City, C. R. Downs, Supt., unwatering the shaft progresses. A steam pump was used until the 500-foot level was reached, since which time, the pump being unequal to the work, water skips have been used. During last thirty-five days were hoisted 21,000 skips of water, the skips holding 250 gallons each. The biggest day's work was 909 skips. The shaft had to be retimbered. Timbers used are 14x14 inches for the first 200 feet of Oregon pine; now using the heart of red spruce from east of Amador. The shaft has two compartments and a manway, has an incline of 62°.——The new hoisting machinery for the South Eureka mine is being put in place. Supt. Parks is clearing for more powerful hoisting machinery at the east shaft on the Kennedy mine.

BUTTE COUNTY.

Judge Gray, at Oroville, has decided six suits brought by various holders of property along Feather river against Biggs, Bates & Freeland. In each case the judgment is in favor of the plaintiff. Biggs and associates located claims in the river bed near Oroville for dredging purposes; actions were brought for the recovery of the property. Judge Gray considers that his decision is in accord with other decisions, that the boundary line in such cases extends to center of the channel, where not otherwise expressly stated in patent or deed of conveyance.

Schuyler, Starr & Myers are inspecting the Spring Valley mine at Cherokee. A flume is to be laid in the main tunnel 5 feet wide, 3000 feet long.

The J. Wagner mine, Morris ravine, will be reopened and the shaft retimbered.

CALAVERAS COUNTY.

The Mokelumne M. Co. of Lancha Plana will work the bed of the Mokelumne river, using a big steam shovel, built in Toledo, Ohio, at a cost of $10,000.

J. Mora at El Dorado is examining the Live Oak mine.

The Tuttletown and Angels Aerial Tramway Co. will build from a point on the railroad of the Sierra Railway of California near Tuttletown to Angels Camp; capital $100,000; subscribed $25,000; A. Poniatowski, S. D. Freshman, W. Angus, W. Gregg, E. P. O'Brien.

At the Oriole mine the ore assays $20 per ton. At the bottom of the shaft, 429 feet, is found milling ore. It is the intention to sink 200 feet deeper. Stations have been cut at 100, 200 and 300 feet; fifteen men are employed.

EL DORADO COUNTY.

Georgetown Gazette: Men are at work on the Horseshoe Bar gravel mine, near Josephine.

The Little Gem mine, near Josephine, has suspended operations.

INYO COUNTY.

Albright & Skelton are developing a mine 5 miles southeast of Pine City, near Mammoth.

The Ballarat Co. has let two contracts for work in the mine. F. H. Verencamp is Supt.

R. F. Harrison, who bonded the Ratcliffe mine, will put on more men. A new engine and new air compressor will be put in place.

The Ballarat temperature has recently ranged from 115° to 127° daily.

Antimony ore from Wild Rose canyon is being shipped to New York.

Near Ballarat the Mineral Hill mill is closed down on account of insufficient water. Ten men are working in the mine. D. H. Chaplin is resident manager. The Mineral Hill and Ballarat companies are investigating Panamint canyon water supply, with intention to put in an electric power plant.

KERN COUNTY.

At Bakersfield the Standard Oil Co. is credited with intention to erect tanks and control the oil output of the Kern river oil district.

Near Kramer, V. O. Lyon, in six weeks' trip with a dry washer, saved $900 in coarse gold.

The pumping plant of the Yellow Aster Co. at Goler is completed. The system cost $50,000. In August 3894 tons of ore were mined and milled; average number of men, 62; average, 4½ tons to the stamp; cost of mining and milling, $2.36 per ton.

J. E. Miller of Amalie district has a mine 3 miles west of the Amalie, which assays 2094 ounces of silver to the ton, gold 117 ounces.

The Greenback Copper Co. has incorporated at Bakersfield; capital stock $5,000,000. J. Weringer, $2,500,000; J. M. Keith, $1,249,000; J. J. Mack, $1,249,000; R. S. Elwood, $1000; S. L. Mack, $1000.

Arguments in the case of the Cosmos Exploration Co. vs. the Gray Eagle Oil Co. was made in the Circuit Court at Los Angeles this week before Judge Ross. The case at bar involves the issues existing between the mineral locators and the scrippers. Both sides are confident; the Judge's decision will be regarded as a precedent. The present suit is an action for the appointment of a receiver, and it is supposed will be followed by others, whenever any scrip selections have been made in the Kern district.

Echo: Oil shipments from the Kern River district have reached about twenty carloads a day. Last Sunday a train of twenty-eight cars was pulled out of the field. This would show a daily production of over 3000 barrels. The prediction is now being made that within five months a daily production of at least 10,000 barrels will be reached in the Kern river fields alone. Twenty carloads of oil were purchased last Saturday by the Southern Pacific. The sale was made by the Kern River Oil Co., operating in the McKittrick field.

MARIPOSA COUNTY.

(Special Correspondence).—Capt. A. H. Ward has at last made satisfactory arrangements regarding the Hite mine. The old mine has yielded over $2,750,000 in gold, and, by the payment of $46,000 to Hite, the Hite Cove G. M. Co. takes possession. The 1100 shaft will be sunk 200 feet deeper, the ore chute will be drifted on and new appliances put in. The Miners' Loan & Investment Co. of Boston, Mass., is in the deal, and Capt. H. H. Todd of Alameda will probably have his headquarters, as manager, at the mine here, while the San Francisco office of the company will be at Capt. A. H. Ward's business office, 71 Stevenson St. All the parties mentioned have interests in the new organization, and work will now begin on a new lease of profitable life for one of California's oldest gold-producing properties.

Hite's Cove, Sept. 5.

It is reported in Mariposa that the ore from the Mariposa mine averages about $20 per ton. The management is credited with intention to erect a 10-stamp mill this fall.

L. E. Aubury is operating the Sierra Rica and Roma mines. The lower tunnel of the Roma is in on the ledge 900 feet.

Independent: Capt. A. H. Ward of San Francisco is preparing to resume work on his Pino Blanco properties.——Kenney & Gilbert have bonded four claims on Turnback creek, 9 miles from Sonora.——The owners of the Benvenuta, formerly the Virginia, have issued a prospectus of the property for a stock proposition. W. C. Randolph of Quartz Mountain has transferred his $150,000 bond on the mine to San Francisco parties.

NEVADA COUNTY.

The California G. & C. Co. is organized at Spenceville; A. W. Winberg, F. B. Yerby, P. Ehmann, C. C. Bitner, M. H. Jackson, J. H. Austin; capital stock, $40,000; subscribed, $2000.

ORANGE COUNTY.

The Olinda ranch, 440 acres, Fullerton field, has been sold to Los Angeles men; the Olinda Crude Oil Co. has been formed, capital $2,000,000. Four hundred acres is under lease to and being developed by the Columbia Oil Producing Co. and the Fullerton Con. Oil Co.; the royalties paid aggregate about $30,000 annually.

PLACER COUNTY.

The Sacramento folio of the U. S. Geological Atlas says: During the Neocene period the auriferous gravels accumulated on the slope of the Sierra Nevada, and at the same time there was deposited in the gulf then occupying the great valley a sedimentary series consisting of clays and sands to which the name "Ione formation" has been given. Beds of this age, which probably underlie the larger part of the Pleistocene or surface formations in the valley, are exposed only to a limited extent. At Lincoln there is a succession of white sand and clay beds containing a few seams of lignite. North of Rocklin the same series 50 to 100 feet thick is exposed in places below andesitic beds. The strata form characteristic flat-topped hills and consist of light colored clays and white or yellowish-brown sandstones. On top of the Ione formation there is usually a layer of reddish Pleistocene gravel a few feet thick. The highest point at which the beds are found is about 450 feet above sea level.

SACRAMENTO COUNTY.

The dredger on Sailor Bar is at work under the supervision of W. Stanton. The boat is 105 feet long, 40 feet broad, 7 feet deep. The various parts of the machinery are driven by separate electric motors so that each can work; actual working power of the dredger, 3000 cubic yards per twenty-four hours. All gears and working parts are made of steel; the back of each bucket is a steel casting. Five men on a shift run the machine, shifts changed every eight hours. The power for dredger and big centrifugal pump to keep the pond filled aggregates nearly 500 H. P., supplied from the electric plant of the Sacramento Electric, Gas & Railway Co. The Ashburton M. Co. is owner of the bar and dredger.

SAN DIEGO COUNTY.

The usual result of careless use of an iron bar in tamping is reported from the Queen mine at Hedges, by which D. Bean and W. Ames lost their lives. The men were on the morning shift and were tamping the powder preparatory to their first blast. In tamping they used an iron bar and the powder was ignited. The bodies of the men were badly mangled.

SANTA BARBARA COUNTY.

A lithographic stone is reported discovered in Loma Blanca range 20 miles northeast of the city of Santa Barbara, 5 miles long, 60 feet wide, in layers of 4 inches. A Los Angeles company to quarry the stone is organized, E. M. Ross president.

SHASTA COUNTY.

A 30-inch gauge railroad will be built from the bridge over Pit river to the Bully Hill mine.

A fifty-year franchise to conduct an electrical power plant, to furnish power and lights to mines and unincorporated towns of the county, has been sold by the supervisors to A. H. Davidson of San Mateo county.

The Bully Hill smelter will be in operation by Jan. 1, 1901.

SISKIYOU COUNTY.

At the Black Bear mine J. Daggett has developed ore in a new territory from the old workings of the mine. There are 10 miles of tunnel, shafts and stopes. The 10-stamp mill is steadily operating.

At Etna Supt. Foley is driving a tunnel at the Know Nothing mine.

J. E. Childers, foreman Pumpkin Roller quartz mine, says the ore assays $6.93 in gold, 8.6 ounces in silver.

TUOLUMNE COUNTY.

At the Mohican M. Co.'s property Lillian tunnel No. 2 is in 160 feet on the vein. The ledge shows 3 feet quartz on the hanging wall, 2 feet on the foot wall.

At Stent on the 3d in the double-handed drilling contest—first prize $125, second $50—there were four entries, two teams being from Amador county. L. Page and H. Wainwright won first money, drilling 33 inches in Rocklin granite in fifteen minutes; second money was won by R. Hurley and J. Burbank.

The Santa Ysabel assessment has been paid on every share of the 130,000. Stockholders representing about 129,000 others have assented to the plan of reorgani tion.

Sonora Democrat: The two-compartment shaft at the Confidence mine is down 200 feet.——The mill on the Dead Horse has closed on account of shortage of water.——Grading is under way at the App to make room for forty additional stamps.——At the Norwegian mine a 7-foot ledge that assays $23 per ton has been struck in the shaft on the 700 level.——The Old Tuolumne M. Co. has incorporated; capital $1,000,000; E. C. Dozier, D. Levy, W. J. F. Geary, W. O. Powers, E. A. Roberts.——Twenty miners are employed at the Shawmut mine. Two miles east of the mine a storage reservoir will be built. Supt Terry states that the 235-foot crosscut tunnel, when finished, will connect three other tunnels, opening up bodies of ore. A building for the 50-ton cyanide plant is nearly completed.

Independent: On the 4th the Green Con. G. M. Co. bought the Mount Vernon quartz mine for $38,000. The Mount Vernon is in the Sugar Pine mining district. The new company has its principal place of business in Phœnix, Arizona.——The Mount Jefferson is arranging to put in a new boiler plant. Ten stamps will also be added to the ten in use.——The Gem, near the Mount Vernon mine in the Sugar Pine district, is being vigorously developed by Sedge & Bottini, the owners.——Brown & Rodgers have bonded their two mines to J. G. Couch, formerly manager Merced G. M. Co. The property is an extension of the McAlpine on the south. Ore is being taken out for a mill test.

YUBA COUNTY.

The Marysville & Nevada Power & Water Co. proposes to build a ditch and flume from the Feather. Chief Engineer Engelbright's report gives figures for the construction from a point at the dam to a point 19 miles below: Ditch proper, 8 feet on bottom, 13 feet top and 5 feet deep, grade 7 feet to the mile, 15 miles, estimated cost $20 per rod; 4 miles flume, 8 feet wide, 5 feet deep. At upper or receiving end flume 9 feet wide, grade 9 feet to the mile, estimated cost $35 per rod. At a point 19 miles below the dam it is proposed to discharge 2000 inches of water under a pressure of 400 feet, to furnish 1800 H. P. From the above point it is proposed to construct a ditch and flume 6 miles that will carry 8000 inches of water: required dimensions of ditch: Bottom width 7 feet, top width 12 feet, depth 5 feet, grade 8 feet per mile; flume 7 feet wide, 5 feet deep, grade 10 feet to the mile; 3 miles of ditch, estimated cost $18 per rod; 3 miles of flume, cost $28 per rod. It is considered practicable to discharge 4000 inches of water into the Yuba river at this point under a pressure of 1200 feet, furnishing 1200 H. P. From this point the water must be carried through the divide separating North Yuba from Dry creek by a tunnel.

Levy, Canavan and Hilton are in Smartsville this week consulting with H. C. Stillwell, manager Blue Point Gravel M. Co. regarding drifting on the channel and working the gravel by a new process.

COLORADO.

BOULDER COUNTY.

The Boston mill at Ward is sold to the B. & M. Co.

CLEAR CREEK COUNTY.

Idaho Springs Gazette: Bids are being received by the Stanley management for the erection of a 100-ton concentrating mill in two sections, which it is proposed to build near the power station below the shaft building.——The Allan mill has been completely rebuilt for concentration of ores by jigs and tables.——The Little Richard shaft is down 622 feet, with stations at 300, 400, 500 and 600 feet, leaving a 22-foot sump. Drifts are being run from the 600-foot level each way; 17 inches solid mineral shows in the east drift and 5½ inches of a better grade in the west drift. In the 300-foot level west the streak is not so large, but the same character of ore, running $59.12 per ton.——The Big Chief shaft is down 374 feet. The streak varies from 6½ to 29 inches in width. The present contract will finish the shaft to a depth of 500 feet, and no drifting will be done till the 500-foot mark is reached. Stations will be at 200 feet and 500 feet. The mineral will average $14 per ton, although assays have ranged as high as $165 per ton.

FREMONT COUNTY.

The Rocky Mountain smelter at Florence will be ready for operation Nov. 1. It is an independent concern, is backed principally by Iowa people, and when completed will have a capacity of 550 tons of ore a day. It is to be a semi-pyritic smelter, drawing largely upon Cripple Creek district for silicious ores.

GILPIN COUNTY.

Register-Call: At the Running lode, near Black Hawk, drifting is carried on in the seventh or bottom level at a depth of 530 feet on both sides of the shaft. The west level shows a streak of rosin zinc and lead ore about 12 inches wide, which carries values of $109 per ton. Stoping is being carried on in the sixth level, where milling ore is being taken out, found in crosscutting by Supt. Dunstone. Two shifts are at work, twenty-four men; seventeen are day's pay men, the rest leasers. Enough ore is being shipped to keep three batteries going at the local stamp mills. It is being operated by the Gowers Mines Syndicate.

A shipment of smelting ore made at Black Hawk from the Freedom mine on Winnebago hill gave returns of 3.36 ounces gold and 4.40 ounces silver per ton for a lot of 11,840 pounds, and for another lot of 3400 pounds returns of 2.52 ounces gold and 2.50 ounces silver per ton were obtained.

GUNNISON COUNTY.

The Dale M. Co. at Midway has its 10-stamp mill completed. Twenty men are employed.

HINSDALE COUNTY.

Near Lake City, J. B. Brooks, manager San Cristobal G. M. & M. Co., at the Hiwasse mine, has thirteen men employed. A mill is to be run at Granite falls; capacity, 65 tons. A tramway from the mine to the mill would cover 3 miles.

LAKE COUNTY.

Two new furnaces for the enlargement of the Loder pyritic smelter at Leadville are being manufactured at the Denver Engineering Works, each capable of treating 200 tons daily.

Manager McMillan of the Sierra Blanca M. & R. Co., operating on the eastern slope of Sierra Blanca, has three tunnels started. He says his company contemplates the erection of a mill at the foot of the mountain and connected by a 1500-foot tramway with the mouth of the tunnel.

The work of broad-gauging the entire system of the Colorado & Southern Railway to Leadville has begun. When completed, all of the mines of the silver-lead belt will be reached by a broad-gauge line, which will do away with the necessity of hauling any ore after one loading. Under the present system it was necessary to reload the ore from the mineral belt narrow-gauge line to the broad-gauge cars.

Miner: At Leadville the Home M. Co. is sinking the Penrose shaft. The siliceous ores of the Penrose carry about 50 ounces in silver and 14% lead. The iron ores carry 12% to 18% in lead and paying values in gold and silver.

OURAY COUNTY.

The Ouray Herald says the Camp Bird property has not been sold. "The management does not seem cognizant of any unusual transaction and great preparations are being made for fall and winter work. The output will be doubled and 500 men will be working by Nov. 1."

SAGUACHE COUNTY.

Near Crestone the San Luis Valley L. & M. Co. have the machinery for their 100-stamp mill on the ground. The company has a 5-inch streak of hematite, carrying twenty-eight ounces gold and five ounces silver.

Four miles north of Crestone the San Isabel M. & M. Co. have a fifty-ton concentrator completed. Manager Granville expects to have it in operation by the 10th inst. He is building a tramway three-fourths of a mile in length to convey the ore from the mine to the mill and putting in a six-drill air compressor.

Bonanza reports the sale of the Eagle mine to Creede men for $60,000; cash, $15,000. New machinery will be erected.

Supt. Ashley of the Cliff mine is building a wagon road leading from Copper gulch to the mine.

Twenty-five men are employed on the Hanover mine breaking low-grade ore.

SAN MIGUEL COUNTY.

(Special Correspondence).—The Tom Boy mill in Savage basin is treating 180 to 200 tons of ore per twenty-four hours. This is quite distinctively a free milling proposition, as doubtless 85% of the saving is made on the amalgamating plates upon which the material, thirty mesh, discharges from the seven Huntington mills. The other 15% saving is made in the concentrates from Frue vanners, the product of the latter being unusually clean, perhaps carrying only from 5% to 7% of silica. The entire mill has been operated by electric power during the past year, same being transmitted from the plant of the Telluride Power & Transmission Co. at Ames. The seven mills are run by two motors of 50 H. P. each; the crushers and rolls by a motor of 50 H. P.; a 100 H. P. motor operates the six-drill compressor; at a point in the main tunnel, about 3000 feet from the entrance, a 100 H P. motor operates a hoister at the three-compartment shaft which extends from the 600-foot to the 800-foot level. Adjoining the motor room at the mill is a transforming station, by which the 10,000 volts from the main power house are transformed down to 110 volts for motor use. Rawhide pinions are to be brought into use on the gearing of the electric hoist to partially do away with the deafening noise produced by the metal gearing. The main tunnel and the principal drifts on the different levels are well lighted by electricity.

The Tom Boy Co. has a bond and lease on the Argentine property, which covers a well-defined lode almost parallel to that of the Tom Boy and extending through the range from Savage to Ingram basin. The outcropping of the Argentine is very conspicuous and the lessees, in driving a drift on the ledge from a point just below the Tom Boy mill, have run into ore of good values, and which thus far appears to be a sulphide of lead and iron. Further developments on the Argentine are likely to be important.

The Columbia lode lies farther southward and runs nearly parallel to that of the Argentine. The former was a producer a few years ago, but has been closed down during the past two years. Recently a reorganization was effected and the mine and mill were started up a few weeks ago under the name of the Menona M. & M. Co., with R. W. Davis, Jr., as Supt. The mill is operating ten stamps and five concentrators, from thirty to thirty-five tons of ore being put through daily. No plates are used. The concentrates run well in silver, lead and gold, making a product worth about $65 per ton. Present efforts are directed to cleaning out the drifts and levels and retimbering. The mine is opened through two tunnels—the upper going in 350 feet on the vein and the lower tunnel cutting 1361 feet as a crosscut to the vein. On the level of the lowel tunnel about 1500 feet of drifting has been done, which, it is claimed, shows the vein to range from 4 to 15 feet between the walls. The ownership of the Columbia, now the Menona, is in the hands of Eastern people.

The Japan concentrating mill is running very successfully and has some interesting features. The material, after passing through crushers and coarse rolls, is carried to a three-mesh screen, the oversize from the latter being returned to the rolls; but that which passes this screen goes to a four-mesh screen, the oversize from the latter passing to the coarse jigs. What passes the four-mesh is carried to an eighteen-mesh screen, the oversize from the latter going to the second jig. The material that goes through the last named screen is carried to a hydraulic separator, the heavy product therefrom passing to the fine jigs. The overflow from the hydraulic separator is converged to the slime jig. The tailings from all the jigs pass through a 5-foot mill, having one-millimeter screens. Then the product of the mill is carried to hydraulic sizers, the coarse from the latter going over a Wilfley table set to run 245 revolutions per minute. The heaviest material from the hydraulic sizer is drawn off to a second Wilfley table which runs 265 revolutions per minute. The overflow from the second hydraulic sizer passes to a Triumph vanner. The systematic, careful work in the Japan mill is due largely to the efforts of Supt. M. B. Pickel, who has had extensive milling experience in Montana, as well as in Colorado.

The Liberty Bell mill is steadily operating with batteries of forty rapid-drop stamps, crushing 120 to 160 tons of ore per day. To increase the amalgamating surface double-decked plates are in use. The material from the plates is carried by hydraulic distributors to double-decked Wilfley concentrators. The tailings from the tables are subjected to cyanide treatment and this constitutes one of the most interesting features of the mill, being a demonstration of the South African direct method. By means of Butters distributors the tailings pass from the tables to 300-ton circular vats, each 30 feet diameter and 8 feet deep, built of California redwood. The Butters distributor, one to each vat, is made to revolve by the force of the discharge, thus distributing the material to every part of the vat, the heavier particles constantly settling and the slimes, held in suspension in the water, overflowing at the six slime gates on the sides of the vat. By this means the flour-fine clays which would retard percolation are to a large degree drawn off, the distributors keeping the slime-laden water in a state of agitation during the process of filling the vats from the concentrator tailings. When the vats are filled with these settlings the moisture contained therein is drawn off by vacuum pumps. Then a weak solution of cyanide is applied and after a short-time treatment the entire mass from each vat is discharged through bottom gates into a vat of same dimensions immediately under it, where a stronger cyanide solution is applied; and after the leaching is complete the solution is drawn off into the zinc precipitating boxes in the usual way. After precipitating the solution is drawn into a sump tank where its cyanide strength is tested, thence it is taken to the regular solution tanks, where sufficient cyanide is added to bring the whole up to the requisite strength. About nine days are required from the time the material is distributed into upper vats till the refuse is drawn off from the lower vats. The management is now starting to treat 4000 tons of tailings collected last season. Forty additional stamps have been ordered and likewise additional vats and tanks. There are now three upper and three lower vats in use. When the mill capacity shall be doubled there will be five upper and five lower vats in use. The work of the mill is automatic and it is claimed the tailings have about equal value in gold and silver, and that the cost of treating them falls below 75 cents per ton. The main values, of course, are saved on the plates, though the close saving in concentrates and the tailings therefrom constitute a most interesting feature. The cyanide feature was designed by F. L. Bosqui, formerly at the Standard mine and mill at Bodie, Cal. J. W. Mercer is manager of the Liberty Bell mine and mill.

The new Smuggler-Union mill has been running since about the first of the present year. A quite complete description of its construction appeared in this paper in November, 1899, and an illustrated account of its workings was published in the MINING AND SCIENTIFIC PRESS in the early part of this year. It is now observed that practically no changes from the original plans and equipment have been found necessary. The eighty rapid-drop, 1000-pound stamps, twenty-four Gilpin county bump tables below the plates, four Chilian mills and four Wilfley tables set upon intermediate platforms between the amalgamating floor and vanner floor; the thirty-six Triumph vanners on the lower floor constitute the essential features of the equipment, with the exception of the power department. In the result about 40% of the saving is on the plates, 60% in the various concentrate products. The concentrate product runs high in silver; the bullion retorted from the amalgam runs only about $10 per ounce. The bumping tables perform an important part. By them three separations are made. The material in passing from the plates to the bumpers falls upon 18-mesh screens; that which fails to pass the latter is carried to Wilfley tables and Chilian mills. That which does pass the 18-mesh screen to the bumpers is separated into two classes—the first being the heavy concentrate which is saved off the bumpers, the second being the tailings which pass from the bumpers through laterals down to the Triumph vanners. The material in discharging from the Chilian mills comes in contact with amalgam plates before passing to the vanners below. A tank on the intermediate floor is supplied with hot water from the condensing engine for vanner use.

The new mill is operated by steam, but a large electric generator is being put in at the mill to be operated by water power, for which a pipe line is being run to convey water from Bridal Veil basin. The new generator will operate a 30-inch double cylinder air compressor already in place at the mill. This compressor will operate drills in the Smuggler-Union's Pennsylvania tunnel through a 3500-foot pipe line now being put in. Incidentally it may be noted that a connection is being made between this company's Bullion tunnel and Pennsylvania tunnel, a vertical distance of 750 feet. A winze from the former and an upraise from the latter are in progress. The two Smuggler-Union mills are handling between 12,000 and 13,000 tons of ore per month, and the gross output therefrom per month amounts to a little over $80,000, or at the rate of nearly $1,000,000 per year.

Among the properties in Gray's basin, between Ingram and Bridal Veil, is the Mayflower, operated by E. L. Davis and associates. The property has about 1000 feet of development, is working two shifts per twenty-four hours and taking out quite a tonnage of ore, which is carried by pack animals to the Smuggler-Union mill for treatment.

The Keystone placers near Vance Junction are being worked with a Ludlum elevator, by which the bedrock was reached a short time ago at 60 feet depth.

The Special Sessions, on Mt. Wilson, belonging to E. L. Davis and others, is a gold property at about 12,000 feet altitude, and is 9 miles from Rio Grande Southern railway at Wilson. The property is being developed, but is not shipping as yet. An upper tunnel goes in 300 feet on the ledge; a lower, crosscut tunnel cuts the vein 150 feet from entrance, there being drifts on the vein 250 feet each way from crosscut. From this level an upraise goes to the surface. A second crosscut extends from the Sessions to the Oasis vein, a distance of 200 feet. A 45-foot shaft has been sunk from lower level of Sessions, all in ore. It is claimed 6000 tons of ore are in sight, that the vein carries a pay streak about 1 foot wide, carrying values running $35 per ton. Some of the gold herein is free, but in the main it is a concentrating proposition. Mr. Davis thinks a mill may be built.

The Gold Run Extraction Co. of St. Louis, under the management of F. L. Bosqui, is operating a cyanide plant near Pandora, extracting the gold and silver from the placer tailings which have accumulated in banks and bars along Marshall creek during the last twelve or fifteen years. The deposits, in the main, consist of tailings from the Smuggler-Union, Tom Boy, Japan and other mills in Marshall and Savage basins. The plant was built last fall, but since Mr. Bosqui took charge, two months ago, it has been enlarged from 100 to 200 tons capacity per day. It consists of two storage solution tanks, 22x6½ feet; two gold solution tanks, 22x4½ feet; two sump tanks, 22x6½ feet; twelve leaching tanks, 25x5½ feet, of 100 tons capacity each. The leaching tanks are ranged in two rows, with a graded bridge, 18 feet wide, extending over each row of tanks, the bridge surface being of 2x4-inch scantling set on edge, 2 inches apart, permitting the tailings, which are hauled and dumped from wagons, to fall through into the tanks below. Each tank, after the leaching, is sluiced out through a center disk gate at the bottom. The company has a two years' lease on the tailings from the two Smuggler-Union mills. Within ten days the plant, now operating with only six tanks, will be running with the twelve tanks, or full capacity. Mr. Bosqui states that the values obtained will average about $4 per ton of tailings. WASCOTT.

Telluride, Aug. 23.

SUMMIT COUNTY.

A. B. Ogden, manager Excelsior mine and mill at Frisco, is also operating the Moose mine near Alma. A new shaft is being sunk on the Moose to reach an ore body found with a diamond drill several years ago.

At Breckenridge Manager Revett of the North American G. D. Co. will raise the sunken dredger and put it in operation.

It is proposed to drive the Prosperity tunnel 1 mile into the Ten-Mile range from a point on the Ten-Mile river, 4 miles above Frisco, where it would attain a depth of almost a mile, and, when completed, would be the deepest mine in the country.

TELLER COUNTY.

Cripple Creek's production for August was as follows:

Mills.	Tons.	Value.	Totals.
Colo.-Philadelphia	8,500	$40	$ 340,000
El Paso	1,500	25	37,000
Metallic	7,000	20	140,000
National	4,000	30	126,000
Arequa	2,400	20	48,000
Economic	3,222	30	64,440
Gillett	2,000	30	60,000
Smelters	13,000	70	910,000
Miscellaneous	....	..	25,000
Totals	41,822	..	$1,750,440

Victor reports that the Trachyte, south side of Bull hill below Altman, has made a strike of hard, fine-grained quartz of phonolytic character that carries a streak of sylvanite.

Dividends at Cripple Creek for August aggregate $806,000. This does not include the quarterly dividends of the Portland, Mary McKinney, Vindicator, Gold King, Stratton's Independence, Elkton, Isabella and several others whose total amount of distribution amounts to over $1,000,000 each three months.

Victor reports a plan for amalgamation of nearly all the properties on Raven hill, between the New Haven on the north and the Louisiana on the south, embracing the Louisiana, Bonnie Nell, Custer, Fido, Cranks, Mary Ann, New Haven and Joe Dandy, for concentrated development. A shaft 1000 feet in depth is projected in the center of the property.

The Temomj stockholders will dispose of their entire holdings to Stratton's Cripple Creek Development Co. for $250,000.

Over 2000 feet of electric wire has been strung in the Columbine–Victor tunnel and forty-five pound rails laid. The electric engine will be capable of hauling twenty-five loaded cars of ore. The Trail tunnel is to be fitted up the same; the ores mined in the Wild Horse will be hauled underground down to the Economic mill.

The Doctor mine has resumed work by putting on three shifts of miners—a total of 100 men.

The Detroit mill of Independence has also resumed.

M. Robbins, agent Armour-Haviland Co. of Chicago, says that he and associates have closed contracts for properties in Teller and Gilpin counties, calling for the payment of $2,000,000.

IDAHO.

ADA COUNTY.

The new mill on the North Star, the Shaw mountain property of the War Eagle Con. M. Co., at Boise, has started. The Jordan gravitation process is in use. The company employs seventy men.

Boise has news of a strike in Boise Basin on the Mattie property, owned by J. D. Small, operating under lease by Daly & Anderson—a streak 10 inches in width, running above $200 to the ton.

BOISE COUNTY.

A strike has been made in the Golden Star mine, Centerville. The ledge where cut shows 4 feet of ore, carrying gold.

R. Winters, Supt. Boston & Idaho Dredging Co., has a new dredge handling 1500 yards per day. The company is figuring on two more dredgers.

SHOSHONE COUNTY.

Recent rains assure sufficient run for the elevator at Murray for the Cœur d'Alene M. Co.

A copper ledge has been uncovered at Camp Seward, 18 miles northwest of Murray.

WASHINGTON COUNTY.

W. H. Dewey has bought the Caswell Bros. property at Thunder mountain for $100,000.

The first cyanide mill in the county is being erected at Black lake by the Idaho Gold Coin M. & M. Co., east of the Seven Devils copper mines, under the management of E. D. Ford.

The mining suit of Halter & Bullard vs. the American M. Co. and G. Stuart has begun in the District Court at Weiser. This is a suit for partition, and seven-sixteenths of the Peacock, Helena and White Monument mines in the Seven Devils, valued at $400,000, is involved.

MONTANA.

FERGUS COUNTY.

The New Year M. Co., Gilt Edge, says it has made successful application of the cyanide treatment to gold in the ores at Lewiston, which is rusty and very fine. A. S. Wright says the ore is mined, milled and treated with cyanide at an expense not to exceed $1.50 a ton.

G. M. Nelson says of the New Year mine near Lewiston that the last month's clean-up netted about $15,000. The cyanide mill on the New Year has been closed down preparatory to increasing the capacity to 200 tons, put in a new tramway to transport the ore to the mill and install an air drill plant for mining the ore more cheaply.

FLATHEAD COUNTY.

At Libby, Manager Edw. Murphy of the West Fisher M. Co., is credited with making arrangements to add thirty stamps to the 10-stamp mill on the West Fisher.

JEFFERSON COUNTY.

A committee of stockholders of the Basin & Bay State M. Co. are out from Springfield, Mass., to examine the interests and investments of the company at Basin. Receiver Berendes of Boulder, receiver for the company, says the committee will do something with the property, either dispose of it or raise additional funds for completing the mill and smelter and get them in operation.

The power company operating the electric plant at Canyon Ferry on the Missouri river projects transmission of power to Butte to be used in the mines and smelters there.

G. H. Platt and J. H. Longmaid of Helena have transferred to the Elkhorn Silver M. Co. the mining property at Elkhorn which they recently bought from the New Elkhorn Co., Ltd., of London. The transfer includes several quartz claims, mill and other buildings, town lots in Elkhorn with buildings thereon, ditches, water rights, etc. The consideration is $20,000, or in lieu thereof 20,000 shares of the capital stock of the new company, which is capitalized at $100,000, with shares at $1 each. It is thought the new company will begin work.

MADISON COUNTY.

Rouderbush, Gillie, Kane & Booth, representing the Amalgamated Copper M. Co., are credited at Pony with intention to buy the Clipper group, which includes the Boss Tweed mine, for $1,000,000. The Sentinel says the transfer will be made by Oct. 1st, and that they will build a concentrator 800 tons daily capacity on the site chosen years ago by the Pony G. M. Co., a tramway to be built from the mine.

The Parrot smelter at Gaylord is being dismantled and will be taken to Anaconda. This property cost $750,000 to build, but was never completed or a pound of ore crushed.

SILVER BOW COUNTY.

Near Butte work on the Smokehouse lode is resumed. The noise new electric hoist is operated, not to be subdued, as it is operated wholly by gearing, no leather belts being used. The new hoist is of 75 H. P. and has a sinking capacity of 700 feet. There was so little room to work that the company bought the lot on which the hoist stands, paying for it $22,000. The company owns fifty-two acres of ground in the heart of the city. The lot just bought will be used to cut the timbers on. The timber to be used will be 10-inch, as electricity will be used for blasting in the mine, and blasts caused by electricity will shake the smelter timbers out of position. The company intends to sink a shaft of three compartments on the Destroying Angel lode, one of their properties, 1000 feet deep.

The tax statements require the grade of the ore taken from the various mines. According to that the gross value per ton of Butte's ores was $14.61, of Anaconda's $13.18, of the Colusa-Parrot's $8.93.

NEVADA.

ESMERALDA COUNTY.

J. Siegel, general manager Vulcan C. Co., Sodaville, says he has cut another ore body east on the 100-foot level.

EUREKA COUNTY.

The Chloride, Climax and Crown Point copper prospects at Bald mountain are bonded to A. H. Tarbet of Salt Lake City, Utah.

LINCOLN COUNTY.

The Quartette M. Co. has seventy-eight men on the payroll.

Supt. Rose is working a full quota of men on his Searchlight group and is shipping carload lots to Barstow. It takes good ore to pay freight; on teams to Manvel, $8; railroad, $2.50; working charges, $5, and 90% returned; the Quartette mill proposes to buy ore in small lots.

STOREY COUNTY.

It is expected that Rheinold Sadler will press the button that turns on the electric current at the Gould & Curry mill about the 25th inst.

On the 5th Supt. Ryan wired: "No. 2 elevator ran twenty-three hours. It was stopped one hour, saving pressure water. At 6:30 this morning the water was 195 feet 6 inches below the 1950-foot level station."

WASHOE COUNTY.

The new 100-ton smelter of the Reno S. & M. Co., at Reno, is completed.

NEW MEXICO.

BERNALILLO COUNTY.

J. A. Coram, president Cochiti G. M. Co., says "sufficient water supply, including that required for economical emptying of the cyaniding tanks, will be in operation Sept. 1. The ore treated for last seven days averages $10.25."

GRANT COUNTY.

The Texas mine at Central, operated by the Bayard S. & M. Co., has a double-compartment shaft almost completed to the 500-foot level. The company is locally credited with intention to go down 2000 feet before they stop.

SANTA FE COUNTY.

The smelter of the Santa Fe G. & C. Co. at San Pedro is building. The air drills are kept at work night and day. Ten thousand tons of gold-copper ore are now ready for the smelter.

The Cerillos smelter will put in a roaster for refractory ores. Additional trackage room is being provided that the ore may be handled by gravity from the cars to the ore bins.

SOCORRO COUNTY.

The Deep Creek M. Co. (White, Sill & Smith, Denver, Colo.) has incorporated to operate 540 acres of copper lands, Mogollon district; capitalization $1,500,000. The company owns twenty-seven patented claims, twenty acres each, paying $60,000. A tunnel will be driven into the mountain.

TAOS COUNTY.

The rejection by the Supreme Court of the United States of the Cebolla grant makes all that mineral region surrounding Red River public domain. This decision restores 20,000 acres of land.

OREGON.

BAKER COUNTY.

The Golconda Co. is arranging to put in forty more stamps.

The Baby McKee mine, 35 miles from Baker City, has been bought outright by Capt. Regnier, a Cincinnati, Ohio, man.

The Badger mine at Susanville has thirty men; the shaft is sunk 300 feet and will be sunk 200 feet deeper.

Near Sumpter work will start on the Buffalo property near the Magnolia. R. T. Cox will be in charge.

JOSEPHINE COUNTY.

S. J. Fore of Cole's, Cal., has bought a seven-eighths interest in the Hungry Feeder and forty acres adjoining the property for $17,500.

On the Whitney ledge Supt. Mitchell has ten men at work. The ledge is 4 inches wide, the pay chute 40 feet long.

UTAH.

Salt Lake Tribune: Utah mine production keeps up at an unprecedented rate. The months so far this year have shown the following ore and bullion settlements:

January	$ 1,666,014
February	1,830,980
March	2,046,413
April	1,470,593
May	1,695,167
June	1,907,129
July	1,605,829
August	1,507,495
Total	$13,729,620

At this rate the ore and bullion settlements this year in this city will reach well above $20,000,000—a figure never before approached in a single year.

EMERY COUNTY.

Near Provo the controlling interest in the Copper Globe M. Co. has passed to men who intend to develop the property; the price was about 50 cents per share. The property consists of six claims, 25 miles southeast of Ferron; St. V. Le Sieur, president.

JUAB COUNTY.

E. H. Buchanan has a year's lease on the Picnic mine at Silver City, and promises to pay the stockholders a royalty of 25% of the net earnings of the mine.

The Spy mine is bought by the Carissa Co. for $50,000. Supt. Underwood will put it in condition.

The Miner reports a strike in the Yankee tunnel which assays 36 ounces silver, 55% lead, $10 gold.

SALT LAKE COUNTY.

The American Smelting & Refining Co. will blow out its gold-sampling rooms and cease the sampling of auro-cyanides west of the plant at Argentine, Kan., on Oct. 1.

SUMMIT COUNTY.

The control of the Sunbeam has passed into the hands of T. Kearns of the Silver King, who will put in machinery to sink 300 feet deeper.

Tribune: Connection with the main ore chute on the 1200-foot level having been accomplished, the management of the Silver King at Park City is opening up ore which shows, per ton, 35.2% copper, $38 in gold, 610 ounces silver, with lead values correspondingly high.

WASHINGTON.

FERRY COUNTY.

At Republic Supt. J. S. Wyatt is putting in a new set of tanks for treatment of ore at the Mountain Lion mill.

D. F. Hallahan has bought the Commercial and Ajax claims, near Sheridan camp, for $4000.

At Republic the strike on the Tom Thumb is considered important and locally justifies belief that in the next six months the mine will produce 200 tons daily.

At Republic the Republic mill will be in operation Nov. 1st; capacity 200 tons daily. There are sixteen tanks, each 22½ feet square and 6 feet deep, capable of treating 1600 tons of ore at one time.

SNOHOMISH COUNTY.

At Monte Cristo the Monte Cristo M. Co. has sixty men on the payroll. The concentrator is daily handling seventy tons. When there is more air and room, the force will be increased to 200 men.

STEVENS COUNTY.

In the copper belt west of Valley the King G. & C. M. Co. has incorporated to work the Anderson mine; J. B. Tuttle is Supt.

WYOMING.

CARBON COUNTY.

(Special Correspondence).—Recent forest fires have delayed progress as most of the companies have been compelled to use their men to fight fires, which have done considerable damage. After the State officials withdrew their men and when the fire was only 1 mile from here we fought the fire and whipped it out. We had a fire line 4 miles long, and after three nights and four days succeeded. At first the people shouted it would be useless, as it would take more men to whip the fire than to whip China. Had this fire got in it would have been death to this camp, as all the timber for miles around is destroyed. The Ferris-Haggerty lost 1000 cords of wood alone, beside other damage, and the fire is still burning around Battle lake. The Ferris-Haggerty is about 6 miles from there. Mr. Ferris' death has put a stop to the Manhattan deal which was pending. Sweet & Cling have located several iron claims within 6 miles of this mine and have found gold float 3 miles from here. The smelter is an assured fact. The contract has been let for the machinery. Before the contract could be let it was necessary for Chas. E. Knapp, manager of the Boston & Wyoming Smelter Co., to raise $100,000 cash. This he has done and the contract for the hauling of 146 tons of machinery from the railroad to Encampment has been let. Dr. Burger, manager Great Lakes mines, has his shaft house completed. The K. C. mine is about 5 miles from Encampment. The Great Lakes mine is taking out good copper ore. The fire near the Great Lakes mine was so fierce that the flames shot 100 feet in the air above the tree tops, but no damage was done to the G. L. M. shaft house.

Encampment, Aug. 31.

FREMONT COUNTY.

At South Pass the Carrisa mine has been incorporated under the name of the Federal G. M. Co. The lower level has been opened up and three ore chutes uncovered that carry ore.

FOREIGN.

AUSTRALIA.

In mining the rapid increase in the production of gold in 1897, 1898 and 1899 has so far this year been checked, and it is probable that the total will not much exceed that for 1899—say about 4,000,000 fine ounces. The expectations formerly held with regard to some of the Western Australian mines have hardly been realized. On the other hand, there is always the possibility of fresh discoveries to be kept in mind. The high prices of the industrial metals have proved of great advantage to the Broken Hill lead mining field, as noted on the editorial page, and the Tasmanian copper field. In several parts of Australia considerable development of copper properties is in progress, and there is no doubt that in time the production will be greatly augmented. There are large amounts of refractory ores in Australia of different kinds that still remain to be made commercially profitable.

BRITISH COLUMBIA.

Near Ymir it is stated that the Keystone has been sold to Spokane, Wash., men for $30,000.

B. C. Riblet of Nelson has finished the new tramway for the Ivanhoe, near Sandon.

The proposed increase of the Provincial duty from 1% to 2% on the output of the larger mines is meeting with considerable opposition from Kootenay mine owners.

A sheriff's sale is announced on the 15th, at Quesnelle, of the plant of the Cariboo Dredging Co.

British Columbia papers note the shipment of 1500 tons of lead ore concentrates from the St. Eugene mine in East Kootenay to Guggenheim & Sons' smelter at Autofagasta, Chile, as an indication that before long other markets than those in the United States and Canada will want the products of British Columbia mines. The deposits in East Kootenay are rich in lead—exactly what are required for fluxing dry ores.

A 20-stamp mill will be installed at the Engineer mine, on Taku Arm, Atlin.

Vancouver reports the transfer of the Brallamer copper mines, on Howe sound, to the Scott syndicate, on the basis of $2,000,000, with a cash payment.

Ainsworth reports that the Highland group is sold to the Highland M. Co., Ltd., for $100,000 cash. A 100-ton concentrator is to be constructed; a wharf will be erected at the mill site, on the lake. The concentrates will be sent by boat to the Hall smelter at Nelson. A 4000-foot aerial tram will connect the mine and concentrator and will be in operation by Nov. 30. A 480-foot head of water, brought by flume from Cedar creek, 1700 feet distant, will furnish power for the concentrating plant. Work on the flume is in progress. The office of the company is at Nelson.

CANADA.

In 1894 Canada produced 5,103,222 pounds of lead; in 1895, 16,461,794 pounds; in 1896, 24,199,977 pounds; in 1897, 39,018,219 pounds; in 1899, 21,862,436 pounds.

MEXICO.

The Mecatona Con. M. Co. has been organized to work properties at Parral, Chihuahua; W. H. Mealy president, D. L. Williams Supt. The mines are 3 miles from the Central station.

The Dos Cabezas gold and silver mine, in eastern Sonora, near Casas Grandes, Chihuahua, the southern terminus of the new Sierra Madre line, is reported bought by Strong, Sturgess & Co. of New York.

A new mining camp has been opened at Agua Caliente, 6 miles north of Chinipas, State of Chihuahua, by R. Gird, an old Arizona miner. The camp is called Guadalupe. The ore carries gold and silver, assaying $15 gold and twelve ounces silver to the ton.

The consolidation of the Avino mines with the Durango Copper Co. is reported ratified in London.

The Lewis Co., ore buyers, City of Mexico, have sold their interests to the National Metal Co., organized in New Jersey with $1,000,000 capital. J. B. Cottle, City of Mexico, is general agent.

At El Oro is organized the Santa Rosa M. Co.; managing owner, J. Corwin, formerly of the Esperanza Co. The property is the most southerly of all the El Oro mines.

THE KLONDIKE.

The N. A. T. Co.'s coal deposits on the Yukon are on Coal and Cliff creeks, on the Canadian side, 70 miles below Dawson. The veins vary from 5 to 25 feet, being very uneven. Very little has as yet been shipped to Dawson, but the boats plying on the lower river all use it, and it finds a ready sale at $30 per ton on the dump. The workings are under the management of J. Watson. About thirty-five men are employed. Wages vary, the regular coal miners getting $5 per day and board; miscellaneous labor is paid for at the rate of $100 per month and board.

Recently Declared Mining Dividends.

Mercur Co., Utah, 20 cents per share, $40,000	Sept. 1
Swansea M. Co., Utah, 5 cents per share, $5000	Sept. 10
Union G. M. Co., Colorado, $312,500	Sept. 5
Elkton Con. M. & M. Co., Colorado, $75,000	Sept. 10
Bunker Hill & Sullivan M. & C. Co., Idaho, $21,000	Sept. 4
Empire State Idaho M. & D. Co., 3%	Sept. 15
Wolverine C. M. Co., Michigan, $2 per share	Oct. 1

Personal.

BERTRAM HUNT has returned to San Francisco from British Columbia.

C. W. KEMPTON writes from New York that he has returned from Venezuela.

WM. NIVEN of the City of Mexico is examining mines in the State of Sonora.

GEO. H. KISLINGSBURY is in Chihuahua, Mexico, examining mining properties.

FRED BOECKMAN, Pres. Champion M. Co., Nevada county, Cal., is in San Francisco.

W. H. HILL is now general manager Idaho Little Giant M. Co., Ltd., Warren, Idaho.

AUGUST SAHLBERG is managing director Esperanza & Serio M. Co., El Oro, Mexico.

H. VAN F. FURMAN has returned to Denver, Colo., from a protracted sojourn in Alaska.

W. H. STORMS of the California State Mining Bureau is in San Francisco writing his report.

LEWIS T. WRIGHT, manager Mountain Copper Co., has returned from London to Keswick, Cal.

PHILIP DEIDESHEIMER of San Francisco is operating the Accident mine, Big Oak Flat, Cal.

R. M. DOWIE of the Keystone Driller Co., Beaver Falls, Pa., is visiting northern California.

WM. ORR of Salt Lake City, Utah, is at Deer Lodge, Nev., starting the Horse Shoe Co.'s new mill.

JNO. DERN, Pres. Mercur G. M. & M. Co., of Utah, arrived in New York from London yesterday.

SUPT. RALSTON, Melones Company, has returned from Calaveras county, Cal., to San Francisco.

WALDEMAR LINDGREN of the U. S. Geological Survey is examining the country around Sumpter, Or.

OTTO GRAMM, president of the Laramie Iron Works, Laramie, Wyoming, is visiting San Francisco.

C. C. BURGER, consulting engineer for the Cook–Turner Co., New York City, has returned from a trip abroad.

EMMET BOYLE of Nevada county, Cal., goes this week to the employ of the Esperanza G. M. Co., El Oro, Mexico.

P. P. BUSH, general Western agent Canton Steel Co., Canton, Ohio, is in Salt Lake City, Utah, from Denver, Colo.

F. G. FARISH, formerly assayer Grand Central M. Co., La Colorada, is now manager for the Japan Con. M. Co., Telluride, Colo.

R. C. MASON is succeeded as superintendent construction at the new stamp mill of Mass mine at Ogima, Mich., by Henry Key.

C. S. CURTIS, late assayer for the Guggenheims, Parral, Mexico, takes a similar position with the Mexico G. M. & S. R. Co., City of Mexico.

PROF. O. H. PACKER, a mining engineer of San Francisco, has returned from a trip to Michigan, where he examined some iron ore deposits.

S. F. EMMONS of the U. S. Geological Survey is spending his vacation at Greenwood, B. C., and giving expert evidence in the Center Star–Iron Mask case at Rossland.

DAVID CRAELIUS has returned from his European trip and has resumed his old position as general manager of C. A. Luckhardt Co.'s Metallurgical Works, 71–73 Stevenson St., San Francisco.

C. W. WHITELY, manager of the East Helena, Mont., smelter, is in Salt Lake City, Utah, in consultation about the new smelting plant to be erected by the American Smelting & Refining Co. at that point.

J. H. HAMMOND sailed for Boston from Liverpool on the 5th inst. London wires that as the representative of a syndicate composed of Werrnher, Beit & Co. and J. B. Robinson, the South African magnates, and J. Pierpont Morgan and other capitalists, he comes to examine a group of mines in Colorado, and that if he reports favorably it is asserted the syndicate has agreed to purchase the mines for $7,000,000.

JOHN W. GATES, formerly chairman American Steel & Wire Co., arrived last Saturday from Europe. The company's half yearly statement at a meeting last Tuesday showed net earnings for the six months ended July 1 of $6,300,000. Of this total it is stated $800,000 net were earned in the month of May, immediately following the cut in wire products and Mr. Gates' sensational revelations as to overproduction."

GARDNER F. WILLIAMS, the general manager of the De Beers Con. mines, is expected to arrive in London by the incoming mail steamer from South Africa, says the African Review. Mr. Williams was in Kimberley during the siege, and took a prominent part in its defense, and he is now taking, with Mrs. Williams and family, a six months' holiday, which will be spent mostly in America. It is understood that Mr. Williams will secure a number of mining engineers to reinforce his staff before he returns to Kimberley.

GRANT H. BROWN, London representative Flint–Eddy Co. of New York, has returned from St. Petersburg. He says: "Russia is now endeavoring to annex Manchuria and she is depending on American bankers to finance her war loan. Japan is the only power which will possibly object to the Czar's Manchuria programme, and unless the Mikado declares annexation a cause for war the Czar will issue a proclamation annexing Manchuria within sixty days. If Japan calls a halt Russia will immediately go to New York to secure the necessary war funds and place big orders for ordnance there. When everything is ready the Czar will occupy Manchuria and fight Japan. Russia does not anticipate any interference from the other powers in her Manchurian move."

Commercial Paragraphs.

A FORTY H. P. Hercules gasoline engine is being put in at the Mammoth–Collins mine, near Florence, Arizona.

A 16x17 LEYNER COMPRESSOR, manufactured by J. G. Leyner, Denver, Colo., has been bought by the Red River M. Co., Lake City, Colo.

THE Crown Gold Milling Co.'s, 23 Stevenson street, San Francisco, California, new dry process for sizing and concentrating refractory ores is reported to be occasioning interest among practical mining men.

LOUIS FALKENAU has removed his laboratory and school of assaying from 434 California St. to 538 Sacramento St., San Francisco, Cal. His new place occupies two commodious floors and is equipped with suitable apparatus, giving it greatly increased capacity.

AT Houghton, Mich., on Aug. 30th, the Michigan College of Mines graduated a class of twenty-two mining engineers and granted twenty diplomas as bachelors of science. The graduating class includes one member from British Columbia, one from Russia and two from Mexico.

W. F. WAGNER, general manager New York office of Jessop & Sons, Ltd., Sheffield, England, is informed that Jessop's steel has been awarded the grand prix at the Paris Exposition. The firm's exhibit was much the same as that made at the Chicago World's Fair and attracted a great deal of attention.

THE Jeffrey Manufacturing Co. of Columbus, Ohio, was awarded a gold medal at the Paris Exposition covering its line of elevating-conveying and mining machinery. No doubt many of our readers who have enjoyed a visit abroad this summer have had the pleasure of seeing the exhibit of this company.

D. CAMPBELL DAVIES & CO., Durango, Mexico, have established in that city a general agency for mining and smelting machinery and supplies for Mexico, Central and South America, with intent to place orders on a commission basis at the minimum of expense to the manufacturer. They have a system of securing advance information concerning these matters that they consider of value to manufacturers and dealers placing orders through them.

List of U. S. Patents for Pacific Coast Inventors.

REPORTED BY DEWEY, STRONG & CO.,
PIONEER PATENT SOLICITORS
FOR PACIFIC COAST.

FOR THE WEEK ENDING AUG. 28, 1900.

656,801.—RIVETING MACHINE—J. H. Batcher, Sacramento, Cal.
656,767.—BALING PRESS—C. Dodge, Davisville, Cal.
656,815.—RIVETING MACHINE—S. Forman, Sacramento, Cal.
656,776.—GAGED FEEDING JOGGER—R. H. Pratt, Portland, Or.
657,037.—HOSE COUPLING—A. M. Spickelmier, Tualitin, Or.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

MACHINE FOR SPREADING, TRUING AND GAGING DRILLS.—No. 656,415. Aug. 21, 1900. David G. Morgan, Quartz Mountain, Cal., one-half assigned to R. H. McNamara, same place. This invention is designed to spread, true and gage rock drills of that class in which the cutting bits are formed at right angles with each other. It consists of tools or formers, the first of which has separable channeled jaws, means for holding the drill in contact with the jaws and operating them so as to spread the bits, a die follows by which the ends of the bits are squared or straightened after being spread, and finally a gage or sizer into which the bits are successively inserted to bring them to the proper size. The hammers which act to produce these various operations are preferably actuated by fluid pressure. The device is rapid and economical, as it makes it possible to do the whole work at a single heat.

PROCESS OF LEACHING ORES OR TAILINGS.—No. 656,395. Aug. 21, 1900. Edward H. Dickie, Bodie, Cal., one-third assigned to James Kane, same place. This invention relates to improvements in the leaching of ores, tailings and like material containing valuable precious metal in conjunction with a cyanide solution, and is especially designed for use in connection with such ores or tailings as contain base substances which act upon the cyanide in the solution and render it unfit to dissolve the precious metals. This solution prevents the base substances from uniting with the cyanide to destroy its power of dissolving gold and silver. The result is obtained by adding to the cyanide solution a substance which will unite with the base metal forming a salt thereof, and which has little or no affinity for the precious metals, thus allowing the solution to act directly upon the precious metals. The ores are leached in the usual manner.

Catalogues Received.

"ELECTRIC POWER" is an edition de luxe of a volume portraying Westinghouse electric motors applied to stationary service. It is intended for distribution at the Paris Exposition, and is printed in French, English, German and Spanish. It is a handsome specimen of typographical excellence, showing the electric motor operating machinery of every kind all over the world. There is no "talk," or description, merely pictures and an explanatory title to each. The pictures are works of art. The one on page 129 is about as finely executed a half tone as any seen.

Obituary.

NEAR Glendale, Or., on the 3rd inst., E. W. Dana, a mining superintendent, was killed at a shaft on the Copper Stain mine, of which he was in charge. A whim was being worked by a horse, when the harness broke, allowing the bucket to start down at great speed, and Dana, in his effort to stop it, was struck by a harness hame over the heart, killing him instantly.

Latest Market Reports.

SAN FRANCISCO, Sept. 6, 1900.

SILVER—Per oz., Troy: London, 28$\frac{1}{10}$d (standard ounce, 925 fine); New York, bar silver, 62⅝c (1000 fine); San Francisco, 62⅝c; Mexican dollars, 50¼c.

From Jan. 1 to Sept. 1, 1900, silver shipments from San Francisco compare as follows:

	1899.	1900.
Fine silver	$2,645,283	$3,204,442
Mexican	1,550,115	5,424,922
Totals	$4,195,398	$8,629,364

The greater part of the above went to China.

COPPER.—New York: Lake, 1 to 3 casks, 17.00 cash; carload lots, 16.75; Electrolytic, 1 to 3 casks, 16.87½; carload lots, 16.75; Casting, 1 to 3 casks, 16.75; carload lots, 16.50. San Francisco: 18. Mill copper plates, 20c; bars, 22@23c.

Exports of copper during August, according to returns by the N. Y. Metal Exchange, were 13,850 tons. July shipments were about 11,000 tons.

LEAD.—New York, $4.37½; Salt Lake City, $4.20; St. Louis, $4.32½; San Francisco $5.00, carload lots; 5½c 1000 to 4000 lbs.; pipe 6¾, sheet 7½, bar 6c. London, £17 12s 6d=3.80c per ℔.

The New York Report says the recent advance in the price of pig lead by the A. S. & R. Co. is said to be coincident with an agreement entered into by them with the principal Western miners of lead ore. In accordance with this agreement the A. S. & R. Co. are reported to have agreed to pay the lead ore producers a flat rate based upon a price of 4 cents per pound, New York, and to maintain this rate for the balance of the year 1900. Heretofore the price paid by the smelting company has been based on what is known as the brokers' or bullion price which was fixed by the most recent sale of fifty tons of lead delivered New York. The bullion price was usually from $2 to $5 per ton under the actual selling price of the metal, a special sale of 50 tons of lead being made at the close of each day in order to keep the bullion price at such a discount. The lead market to-day is more active, consumers apparently making freer sales of their manufactured products and not being willing to do so without covering them with purchases of A. S. & R. Co.'s quotations of raw material.

The new prices of the A. S. & R. Co., 50-ton lots, are as follows:

Delivered.	Desilverized.	Corroding.
St. Louis	$4 32½	$4 42½
Chicago	4 32½	4 42½
Cincinnati	4 37½	4 47½
Pittsburg	4 47½	4 52½
Philadelphia	4 42½	4 52½
New York	4 37½	4 47½
Boston	4 45	4 55

On carload lots 5c. per 100 lbs. higher.

SPELTER. — New York, $4.10; St. Louis, $4.05; San Francisco, ton lots, 5½c; 100-lb lots, 5¾c.

ANTIMONY.—New York, Cookson's, 10½c; Hallett's, 9½c; San Francisco, 1000-lb lots, 12c; 300 to 500 lbs., 13@14c; 100-lb lots, 15@18c.

IRON.—Pittsburg, Bessemer pig, $16; gray forge, $14.50; San Francisco, bar, per lb., 2.55c in small quantities.

STEEL.—Bessemer billets, Pittsburg, $18.50; sheet bars, $23.50; San Francisco, bar, 7c to 12c per lb.

QUICKSILVER. — New York, $50.00; large lots: London, £9 5s; San Francisco, local, $48.50 ℔ flask of 76½ lbs.; Export, $45.50.

MAGNESIUM.—New York, $3.00 ℔ lb.; San Francisco, $4.00.

ZINC.—San Francisco, 5½c; slab, 6c; bar, 7¾c.

SOLDER. — Half-and-half, 100-lb. lots, 21c; San Francisco, Plumbers', 100-lb. lots, 17¾c.

BABBITT METAL.— San Francisco, No. 1, 10c.

ASSAY LITHARGE.—San Francisco, 10c ℔ lb, small lots.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 35c.

NICKEL.—New York, 50@60c ℔ lb.

PHOSPHORUS.—F. o. b. New York or Philadelphia, 45@50c ℔ lb.

POWDER.—F. o. b. San Francisco: No. 1. 70% nitro-glycerine, per lb., in carload lots, 15¼c; less than one ton, 17¼c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11¾c; less than one ton, 13¾c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2 per keg.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9, in lots not less than 1000.

FUSE.—Triple tape, $3.60 per 1000 feet; double tape, $3.00; single tape, $2.65; Hemp, $2.10; Cement No. 2, $3.00; Cement No. 1, $2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 12¼c ℔ set; 14 oz., 40s., 11¼c.

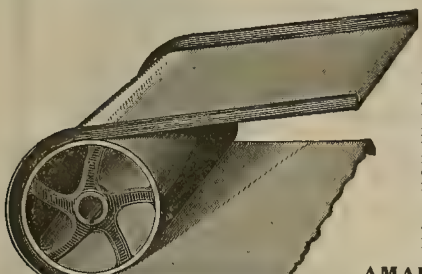
SPADONE'S CONCENTRATOR BELTS.

PATENTED.



This illustration shows the edge flanging outwardly as it passes over the pulley. This relieves the strain from the top and bottom of the edge by directing the strain automatically to the inside face surface of the edges. Heretofore all belts have been so constructed that when they pass over the pulleys or rolls, a direct strain comes upon the top or at the base of of the edges, causing the edges to break away from the body of the belts in a very short time. *We avoid this Mechanical Defect by our Spadone Curved Edge.* Belts made to fit any machine—4, 5 and 6 feet wide. Prices and samples on application.

AMALGAM PLATE CLEANERS.

Our Amalgam Plate Cleaners are made of Pure Rubber in moulds, thus insuring a plate cleaner which will not scratch the plates and a perfect edge which will clean the Amalgam plates evenly. They are made 6 inches long, 3 inches wide and ½ inch thick, making a convenient size to handle. Price by mail to any address, each 75 cents. Correspondence solicited.

Send us your order for Water, Air Drill, Steam, Suction and Fire HOSE, RUBBER BELTING, RUBBER PACKING and LEATHER BELTING.

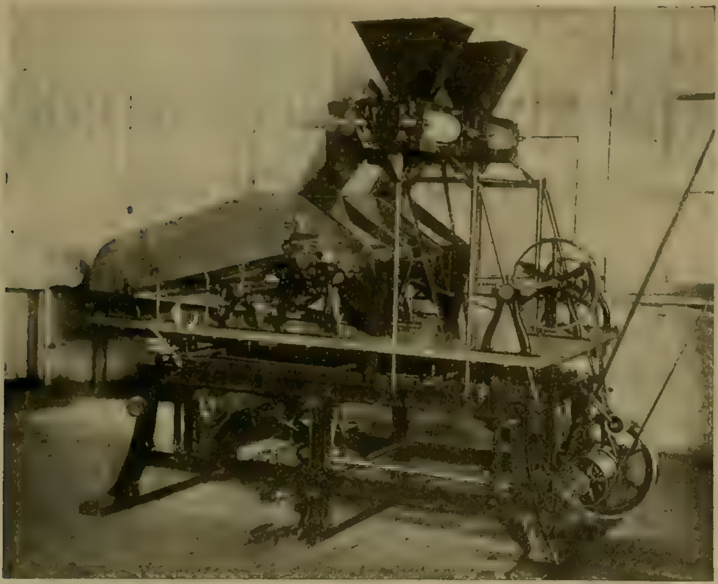
CROWN GOLD MILLING CO.

Manufacturers of the "CROWN" CONCENTRATOR and CROWN ORE SIZER. A dry process of sizing and concentrating ore, sand or gravel. Designed to accord fully with the laws of specific gravity, and especially adapted to refractory ore or localities where there is no water.

The chief claims for the Crown Concentrator are that it occupies less floor space and has nearly four times the capacity of any wet concentrator; that it will concentrate ores containing base and refractory metals that ordinarily slime and carry off values; that it effects a saving of values far above the ordinary methods of concentration.



We have, now in operation, a complete plant for crushing, sizing and concentrating ores by the

Crown Dry Milling Process.

Mine owners desiring tests made can forward us, freight prepaid, not less than 1000 lbs. nor more than 4000 lbs. of sample, for which a charge of $20 will be made. (This amount includes assaying, etc.)

Ores for which this process is adapted and of which consignments are solicited are any concentratable ores, pulps, tailings, or sands, carrying sufficient values, whether they have heretofore been profitably concentrated or not.

THE "PELATAN-CLERICI" PROCESS

OF TREATING REFRACTORY ORES

General Arrangement of Pelatan-Clerici Plant.

Saves the precious metals by the simplest, most economical and most efficient process known. No roasting or previous treatment, except ordinary crushing. Extraction complete in from 6 to 12 hours. Extracts equally well both fine refractory gold and coarse gold in the form of amalgam. Makes a greater saving of gold than any other process from raw material at less cost. The electric current and dissolving agent promptly dissolve the precious metals, both gold and silver. Samples of ore tested free of charge. Several mills saving over 90 per cent of values by bullion returns. Simplicity. Economy. Efficiency.

LOS ANGELES, CAL.

SMOOTH-ON TRADE MARK **CASTINGS.**

An iron cement for repairing leaks or fractures in steam or hydraulic work. When hard it will withstand a red heat, steam, water or oil, and expands and contracts with heat and cold the same as iron, insuring a tight joint at all temperatures. Difficult flange connections can easily be made with Smooth-On, as it adapts itself to the flanged faces whether parallel or not. Connections are easily taken apart. Unequaled for boiler patching, and repairing blemishes in iron castings. Write for catalogue and prices. Sole proprietors and manufacturers: Smooth-On Mfg. Co., Jersey City, N. J., U. S. A.

MINE BELL SIGNALS. Adopted, Used and in Force in Accordance with Law.

We print in legal size, 12x36 inches, the Mine Bell Signals and Rules provided for in the Voorhies Act passed by the California Legislature. The law is entitled "An Act to Establish a Uniform System of Bell Signals to Be Used in All Mines Operated in the State of California, for the Protection of Miners." We furnish these Signals and Rules, printed on cloth so as to withstand dampness. **50 Cents a Copy.**

MINING AND SCIENTIFIC PRESS, 330 Market St., San Francisco, Cal.

THE FULTON Variable Motion Continuous Flow PUMPS

are made in four sizes with capacities up to 30,000 gallons per hour. THE FULTON DOUBLE PLUNGER CYLINDERS to work in connection with them, in 20 different sizes and lengths.

THE FULTON SINGLE ACTING PUMPS are made in 25 different sizes and lengths. The Valves and working parts of both Single and Double Acting Fulton Pumps can be removed, repaired and replaced without disturbing either the Column Pipe or Cylinder.

Manufactured by A. T. AMES, Galt, Cal.

GATES FINE CRUSHER.

The result of ten years' solid work. Success at last. What we wanted, and the public demanded, was a Gates Gyratory Rock and Ore Breaker (always adjustable and indestructible) so modified in design as to make one-half-inch product from three-inch sizes, rapidly and cheaply. The H. Fine Crusher will do this work. It takes the place of expensive big rolls and often prepares ore, without further crushing, fine enough for coarse concentration or cyaniding. In any event, it is the greatest and best intermediate machine between the coarse breaker and the pulverizer.

THE COPPER FURNACE

Here illustrated has OUR PATENT

WATER VAPORIZING ATTACHMENT.

Experience has proven this to be the best of all methods for applying water for the cooling of jackets. It has the further great advantage of using only about one-eighth the usual amount of water needed for that purpose, and all jackets are kept at the same temperature.

We Manufacture Smelting Furnaces and Equipments

FOR THE TREATMENT OF

GOLD, SILVER, LEAD, COPPER and NICKEL ORES.

of any desired tonnage capacity above forty tons per day, and put them into successful operation under guarantee. Write for catalogue showing different styles of furnaces.

We also design, manufacture and erect Smelter Sulphide Mills for crushing and sampling ores. We are the originators of the Narrow Face, Large Diameter, High Speed Crushing Rolls. A full description of our Crushing Machinery is given in a special catalogue, which will be sent on application.

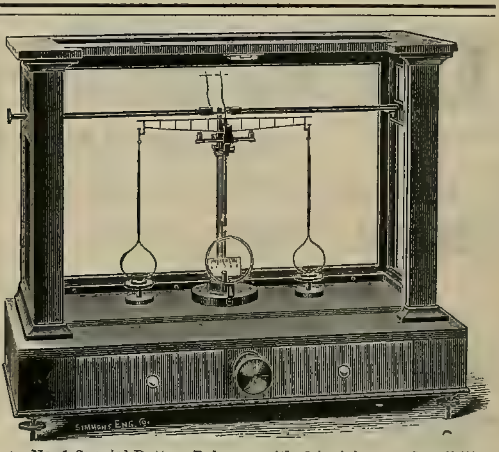
The above illustration shows the method of holding and sighting BRUNTON'S PAT. POCKET MINE TRANSIT, when taking courses or horizontal angles. The construction is such as to permit of simultaneous sighting and reading. No tripod or Jacob's staff is necessary, and an operator, after becoming accustomed to its uses, can take the Transit from his pocket, take a reading and replace the instrument before a sighting compass can be placed. The most accurate and relibale pocket instrument on the market. Send for illustrated Catalogue B to



SIMMONS ENG. Co.

No. 1 Special Button Balance with 8-inch beam. Sensibility 1-200 Milligramme. For very accurate weighings. Among the well-known smelters using this balance are the following: GLOBE SMELTING & REFINING CO., Denver, Colo., U. S. A.; CANADIAN SMELTING WORKS, Trail, B. C.; MT. LYELL MINING & RAILWAY CO.'S Reduction Works, Penghana, Tasmania.

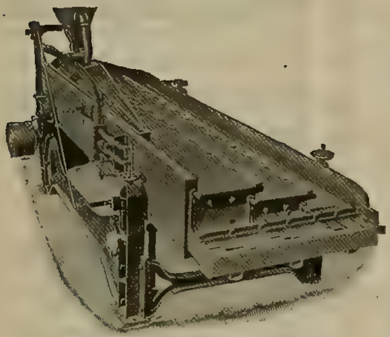
THE IMPROVED BARTLETT CONCENTRATING TABLE.



The BARTLETT CONCENTRATING TABLE has been GREATLY IMPROVED recently by the substitution of iron in place of wood wherever possible. It is now built with SOLID IRON TOP, PLANED TO A TRUE SURFACE AND POLISHED; all parts are made by template and EACH PART BEING INTERCHANGEABLE. As now constructed, the table has no special wearing parts and will last for many years. It has a CAPACITY OF FROM FIFTEEN TO FORTY-FIVE TONS IN TWENTY-FOUR HOURS, according to the class of ore worked. It is the only table in the world which will take the place of jigs and do away with all costly and complicated machinery.

It is Especially Designed for Separating Zinc from Lead.

Send for our illustrated catalogue, containing all the latest information on the concentration of ores.

THE GRIFFIN
THREE ROLLER
ORE MILL.

The Griffin Three Roller Ore Mill is a simply constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilian Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

ASSESSMENT NOTICES.

GOULD & CURRY SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 6th day of August, 1900, an assessment (No. 91) of fifteen (15) cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room No. 69, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 8th day of September, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 1st day of October, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

ALFRED K. DURBROW, Secretary.

Office—Room No. 69, Nevada block, No. 309 Montgomery street, San Francisco, California.

ALLIANCE EXPLORATION & MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Ophir, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 3d day of August, 1900, an assessment (No. 3) of five (5) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 236 Sutter street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 11th day of September, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 2nd day of October, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

S. GOLDSMITH, Secretary.

Office—236 Sutter street, San Francisco, California.

EUREKA CONSOLIDATED DRIFT MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Forest Hill, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 9th day of August, 1900, an assessment (No. 26) of one (1) cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 214 Pine street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 8th day of September, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on SATURDAY, the 29th day of September, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

GEO. W. DIXON, Secretary.

Office—214 Pine street, San Francisco, California.

MARIPOSA COMMERCIAL AND MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Mariposa County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 31st day of August, 1900, an assessment (No. 18) of Ten ($10) Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 320 Sansome street, room 24, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 10th day of October, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on THURSDAY, the 8th day of November, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

JOSEPH H. MOOSER, Secretary.

Office—320 Sansome street, room 24, San Francisco, California.

SAVAGE MINING COMPANY. — Location of principal place of business, San Francisco, California; location of works, Virginia, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 13th day of August, 1900, an assessment (No. 101) of ten cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Rooms 20-22, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 18th day of September, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 8th day of October, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

JOHN W. TWIGGS, Secretary.

Office—Rooms 20-22, Nevada block, No. 309 Montgomery street, San Francisco, California.

AMERICAN OIL AND REFINERY COMPANY.—Location of principal place of business, San Francisco, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 21st day of August, 1900, an assessment of ten (10) cents per share was levied upon all the subscribed capital stock of the said corporation, payable immediately to J. C. Anthony, secretary of said corporation, at its office, at room No. 323 of the Parrott building, Nos. 825 to 855 Market street, in the City and County of San Francisco, State of California.

Any stock upon which this assessment shall remain unpaid on the 26th day of September, 1900, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on MONDAY, the 29th day of October, 1900, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

J. C. ANTHONY, Secretary.

Office—Room 323 Parrott building, Nos. 825 to 855 Market street, San Francisco, California.

DELINQUENT SALE NOTICE.

COLUMBIA ATHLETIC CLUB (INC.)—Location of principal place of business, San Francisco, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 4) levied on the 27th day of June, 1900, and payable Saturday, June 30, 1900, the several amounts set opposite the names of the respective shareholders, as follows:

Name.	No. Cert.	No. Shares.	Amt.
Daniel F. Crowley..............		15	$50 00

And in accordance with law, and an order from the Board of Directors, made on the 27th day of June, 1900, so many shares of each parcel of such stock as may be necessary, will be sold at public auction at the office of the club, 1200 Market street, San Francisco, California, on THURSDAY, the 30th day of August, 1900, at the hour of 12:30 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

JNO. H. EFFINGER, Secretary.

Office—1200 Market street, San Francisco, California.

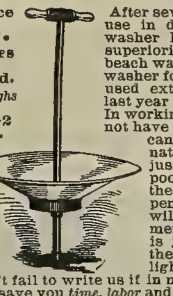
PATENTS

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & CO.'s Patent Agency will have the benefit of a description in the *Mining and Scientific Press.* We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

DEWEY, STRONG & CO.,
PATENT AGENTS,
330 Market Street, San Francisco, Cal.

THE LITTLE ALASKA GOLD WASHER.

Price **$6.** Saves the Gold. *Weighs only* 7 1-2 Lbs.



After several years' practical use in different fields, our washer has established its superiority over all placer or beach washers. It is just the washer for Cape Nome; it was used extensively in Alaska last year with every success. In working the operator does not have to wet his hands and can stand in an upright natural position. It is just the washer for the poor man who has not the money to put in expensive machinery. It will do the work of ten men with gold pans. It is just the washer for the prospector, being light and easy to pack. Don't fail to write us if in need of a washer; we can save you *time, labor* and *money.* RUSSELL & KINSEY, 1237 Magnolia Ave., Los Angeles, Cal.

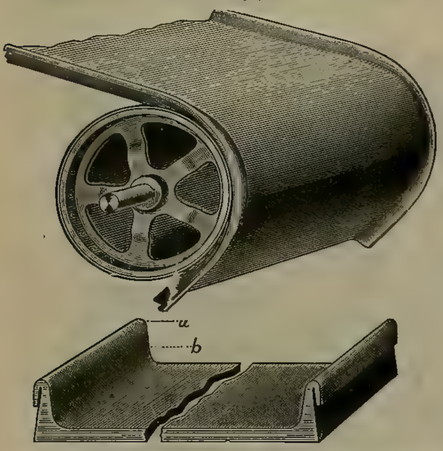
THE BROWNELL "PATENT LIP" FLANGE FRUE VANNER BELTS.



It has taken years of ceaseless testing and experimenting to produce the superior belt which we now offer, with elastic flanges and pliable body reinforced with specially woven duck. Every belt is manufactured by experienced workmen, and carefully tested on machines especially built for that purpose; consequently we are to-day manufacturing the best belts that mechanical ingenuity, combined with honesty of construction, can possibly produce.

RAWHIDE GOLD MINING COMPANY,
JAMESTOWN, TUOLUMNE CO., CAL., Feb. 21, 1897.

J. S. BROWNELL, ESQ.—DEAR SIR: Replying to your query of Feb. 15th, will say that I have used your Patent Lip flange belt more than one year, and judging from their appearance after more than one year of hard service, I do not hesitate to say that they are the best belt I have ever used and I take great pleasure in testifying to the fact. Yours truly, W. A. NEVILLS, President.

AMADOR CITY, CAL., Feb. 18, 1897.

MR. J. S. BROWNELL—DEAR SIR: I take pleasure in saying that I have used your Patent Lipped flange belt for several years while connected with this company, and I consider them the best that we have used. The quality of rubber in the flange seems to be the best, and we are not bothered with the flange cracking and thereby destroying the life of the belt. At present we are using 14 concentrators, and have in use several kinds of belts. We consider your Patent Lipped flange the best. Yours very truly, THE CONS. SOUTH SPRING HILL G. M. CO.
By JOHN R. TREGLOAN. Superintendent.

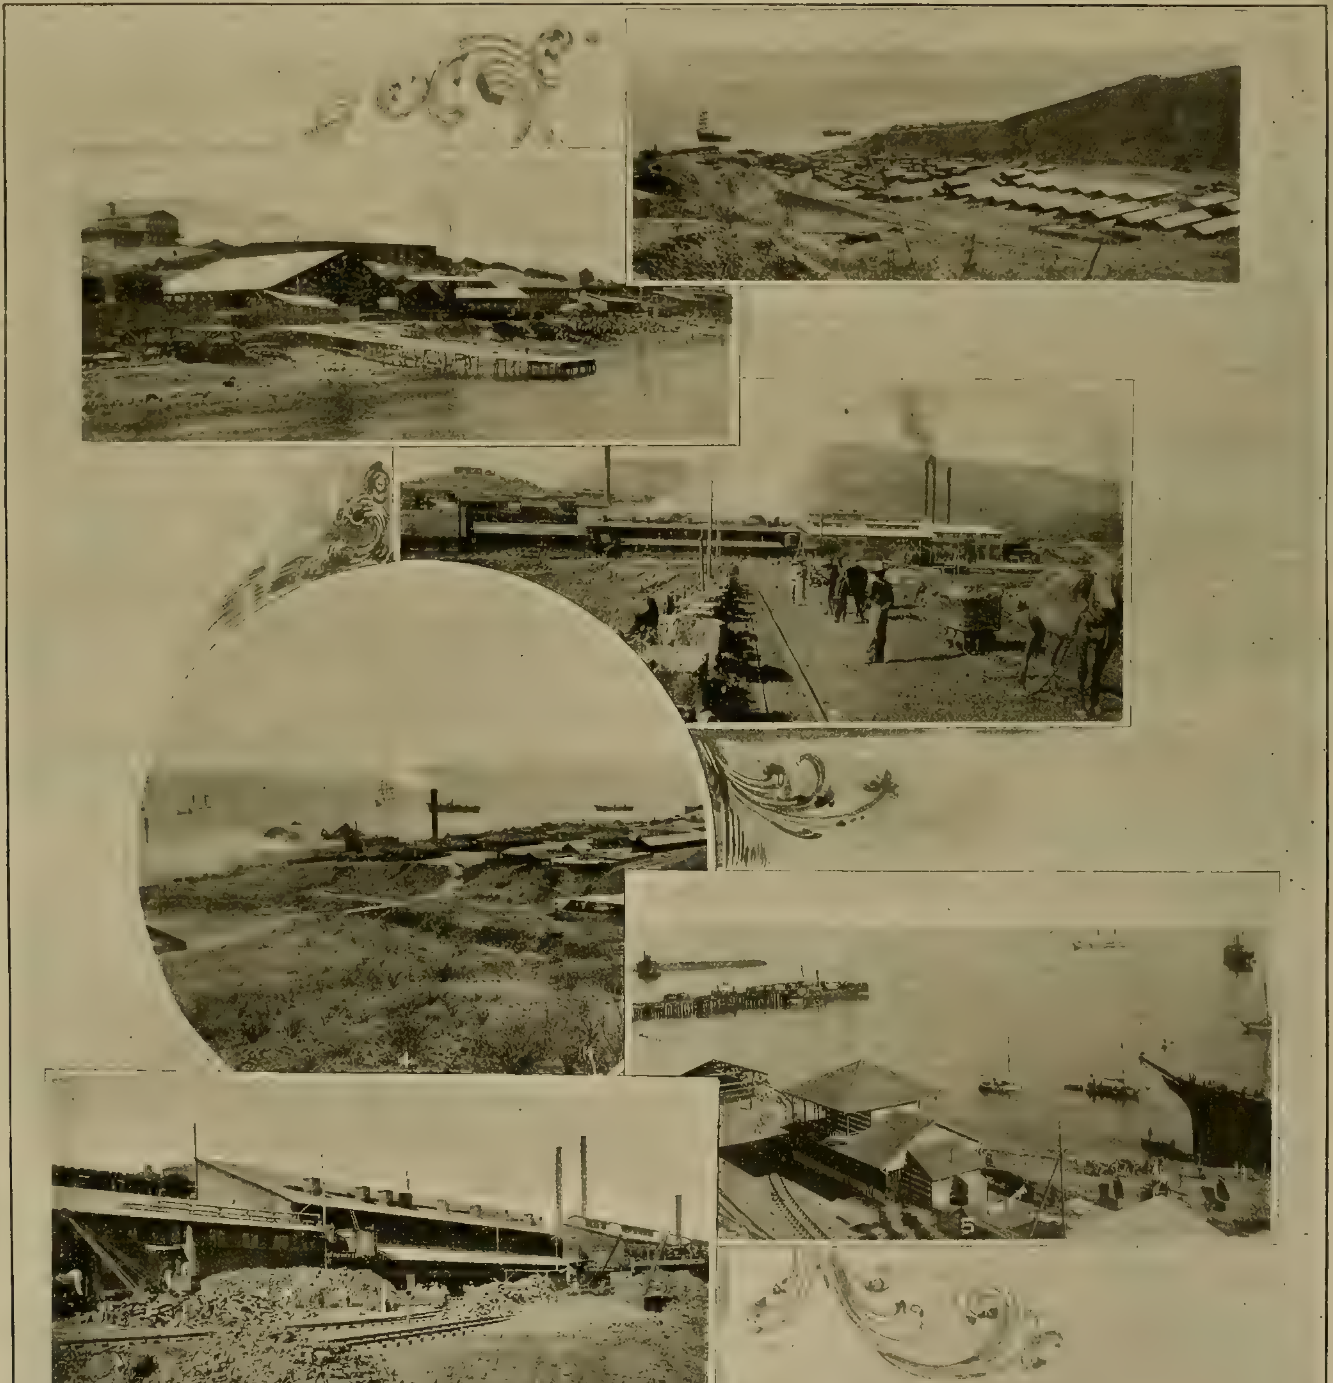
MINING AND SCIENTIFIC PRESS.
AND PACIFIC ELECTRICAL REVIEW.

No. 2095.—VOLUME LXXXI. Number 11.
SAN FRANCISCO, SATURDAY, SEPTEMBER 15, 1900.
THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.



VIEWS OF THE WORKS OF THE COMPAGNIE DU BOLEO, SANTA ROSALIA, BAJA CALIFORNIA.

1.—Company's Offices and Warehouses. 2.—Houses of Employes, Santa Rosalia. 3.—Smelter, Electric Power House, and Construction of the Dike. 4.—General View of Plain and Houses of Employes. 5.—Port of Santa Rosalia. 6.—Smelter Deposits of Copper and Matte.

Campagnie du Boleo.

At Santa Rosalia, Lower California, are the headquarters of the Compagnie du Boleo, a large mining and metallurgical concern, that has spent several million dollars, employs thousands of workmen, and produces large quantities of copper matte. It is distinctively a European enterprise, owned and operated by Frenchmen, and nearly all its transactions are carried on with France and England, though, of course, the mining, smelting, and electrical machinery is of American construction. The company was organized in 1885; its operations are carried on in a paternal sort of way, suited to the environments; good wages are paid, the most modern appliances are in use, and the three groups of mines—the Soledad, Providencia and Purgatorio—constitute an unusually large and extensive body of copper ore.

The accompanying illustration graphically portrays the surface conditions. In the smelting works there are twelve furnaces, with a daily capacity of 1000 tons; the railway is 35 kilometers in length, and, alone, employs 100 men. The company has completed a massive breakwater for its extensive fleet.

EDITORIAL.—Compagnie du Boleo, 309. A Great Danger; Magnetic Separation; Miscellaneous, 310.

MINING SUMMARY.—317-318-319.

LATEST MARKET REPORTS.—319.

MISCELLANEOUS.—Concentrates, 311. California Crude Petroleum as a Fuel; The Estimation of Copper in Ores by the Modified Cyanide Process, 312. Branch Carrying Pipes; California Oil Wells; Location of Mining Claims; Mills and Mill Sites, 313. Boiler Explosions - Cause and Remedy; Assay of Copper Materials for Gold and Silver, 314. Options; Mining and Metallurgical Patents, 315. Mine Bell Signals; Modern Boiler Making; Lithographic Stone; Two Kinds of Brittleness; Cable for Bering Sea, 316. Personal; List of U. S. Patents for Pacific Coast Inventors; Notices of Recent Patents; Books Received; Catalogues Received; Commercial Paragraphs; Recently Declared Mining Dividends, 319.

It is evident that when active mining is renewed on the Rand, South Africa, that the old system of hand drilling by natives will give way to machine drilling, as a measure of economy, doing away with all the list of losses occasioned by the costly and annoying system formerly in vogue.

The progress in metallurgy is one of the greatest achievements of applied science. In Utah silver has been produced at a cost of 23½ cents per ounce; in Montana copper is produced at a cost of 6 cents per pound; in California ore averaging 84 cents per ton in gold has been worked at a profit of 6 cents per ton.

Mention has previously been made herein regarding the hampering effect on mining development of the recent unwise order of the Interior Department concerning the cutting of timber on mining claims. The order bears particularly hard upon that worthy class of claim owners who evince honest effort to develop their claims. In its general wisdom and application it resembles the time-hallowed command not to go near the water till one has learned to swim. The order ties the hands of many miners and is considered simply as one of the usual official mistakes.

This paper is always pleased to publish declaration of mining dividends—receive the name of the company, locality, amount of dividend, and when payable—without charge, and has so done through the years, but can not undertake to announce that any company "will pay" a dividend at any future date. The statement as alleged might be borne out by the fact, but it is deemed better to chronicle the dividend announcement after declaration, and not till then. In this, as in many other things, the character of a paper is largely determined by the statements that do not appear in its columns.

In January, 1898, California celebrated in San Francisco the fiftieth anniversary of the discovery of gold in the State, and during the past week has as enthusiastically celebrated the fiftieth anniversary of the admission of the State into the Union. In the great street paintings and decorations during the week mining scenes and appliances had first rank, and in the procession and display the mining men of the State had equal prominence. About 100,000 "native sons" came to San Francisco to celebrate the event, and about 400,000 more looked on. Men who thought the great celebration of 1898 would not soon be outdone said that the parade that then cost $1000 a minute during its passing was only a fading memory compared with the gorgeous and overshadowing present.

A Grave Danger.

A recent decision of a State Supreme Court in an important mining case overrules the lower court and gives justice by a majority vote of four to three; that is, four of the supreme judges think one way and three think the other way, somewhat after the fashion of a public vote. The three dissenting judges set out at learned length their opinions, arguing diametrically opposite to the other four equally learned judges, and as it happens that four think one way—one more than thinks the other way—the scales of justice incline that way. Probably an easier and less expensive method of securing justice in a court of last resort would be to have a well balanced scales, and pile the briefs, appeals, rejoinders, surrejoinders, arguments and other legal accompaniments for plaintiff and defendant in either side thereof, and award the decision to the party having the weightiest pile.

A verdict of four to three, which would not be allowed in a jury box in a justice's court, is beneath the dignity of a high appellate court and seriously tends to undermine its influence. No State is alone in this degrading practice; nearly every State in the Union has similar experiences, and even the Supreme Court of the United States—the highest tribunal on earth and the most respected—in some instances is itself guilty of what might appear to be trifling with the grave requirements of the nation, as in the case of the decision on the income tax, where the court was divided, one justice changing his mind over night, reversing his opinion of the day before, and thus giving a bare majority to the decision.

We speak of the Supreme Court of the United States as being "the highest tribunal on earth." But there is a still higher one—public opinion—and before that great tribunal all things human are judged and by its standards all things human rise and fall; continue or are overthrown; subsist or are smashed. There never should be a dissenting opinion in the Supreme Court of the State or nation. The decision handed down should be the decision of the court, and not of any judge; any other course is indirectly a blow at its own dignity, at public respect and regard for it, and constitutes a menace to our institutions. People have none too high an opinion of courts now that the courts themselves can trifle with their great positions in reducing regard for what they say to a point even below its present condition. The dissenting opinion of a judge can have but one motive, and that is to give him his little chance of airing his individual views and opinions. No one cares what Brown, J., or Smith, J., thinks about the case in point; the question is, what is the decision of the court, so that men may know what that decision is and govern themselves accordingly. When the curtain is raised and the public is shown the little individual discord and unharmony, it does not tend to enhance public respect for the source of justice which is supposed to flow pure and undefiled.

As it is to the interest of the public that there should be an end to litigation, so also is it to the public interest that when a question is settled by the highest tribunal it should remain settled for all time. The result of the one or two or three dissenting opinions in a Supreme Court decision is simply to open up for future discussion, litigation and bickering, the very question that is supposed to be finally settled by the decision of the tribunal. It must be settled somewhere. In that Supreme Court is the place for settlement; that tribunal was selected as the final arbiter, and for one or two or three of those constituting such final arbiter to publish an opinion favoring the very cause that is decided against by the court of which they are constituted members, is, to say the least, poor policy. When the public reads those dissenting opinions the public naturally gets the idea that justice has not been done by the court; that there is no justice about it; that it simply happens to be four to three, and that if one of the four had happened to have a bad night, or a poor dinner, he might have joined the ranks of the dissenters and then the verdict would have been the other way. This is too slight and tender a pivot upon which to hang the scales of justice, and tends to weaken the court in public esteem, for the common, ordinary lay reader cannot help having the idea, however mistaken, that the court has lent itself to injustice and inflicted a wrong. Some of the dissenting opinions are models of what they should not be in an explanatory and argumentative way. All that is required is a concise, well-written summing-up of the points decided and the reasons therefor, the whole being the opinion of the court unanimously.

There are currents in the streams of time and of national life, which though sometimes broken and temporarily checked, yet turn and double in their course with increasing power and injurious effect. Such currents are flowing noiselessly yet powerfully throughout this nation to-day and threaten to smother in foul depths the fair growth of our institutions. These currents cannot be wholly checked nor smothered, but they need not be augmented. A growing disregard for and disbelief in judicial decisions is among the fountains that feed those currents, and the continuous practice and manifest folly of dissenting judicial opinions and constant weakening regard or belief in the justice of judicial decisions constitutes a grave danger.

Magnetic Separation.

The Wetherill process of magnetic separation is receiving present attention, having a scientific basis of calculation in its theory and practice that entitles it to consideration. O. Bilharz of Berlin goes into its discussion in detail, in connection with the general subject of wet concentration, arguing regarding substances possessing about the same approximate specific gravity, if one of the minerals to be separated is magnetic, that would constitute adequate means of such concentration. In the Wetherill process it is aimed to utilize the smallest amount of magnetism inherent in any ore. In Germany the process is chiefly applied to the separation of spathic iron ore and zinc-blende without any preparatory treatment of the material. The Friedrichssegen Co. estimates a saving of working expenses over former methods of about 35%. At Franklin, N. J., the New Jersey Zinc Co. use the Wetherill process on a large scale, separating Franklinite from red zinc ore and Willemite, treating 400 tons crude ore daily. To mines producing quantities of spathic blende the Wetherill process appears economically applicable. It is maintained that by the use of the Wetherill separator an argentiferous zinc-blende containing 40% zinc can be satisfactorily produced.

The United States Supreme Court, in the case of Black vs. Elkhorn M. Co. (163 U. S., 445), has decided that "the interest in a mining claim, prior to the payment of any money for the granting of a patent to the land, is nothing more than a right to the exclusive possession of the land based upon conditions subsequent, a failure to fulfill which forfeits the locators' interest in the claim. To sum up as to the character of the right which is granted by the United States to a locator, we find: (1) That no written instrument is necessary to create it. Locating upon the land and continuing yearly to do the work provided for by the statute gives to and continues in the locator the right of possession as stated in the statute. (2) This right, conditional in its character, may be forfeited by the failure of the locator to do the necessary amount of work; or if, being one among several locators, he neglects to pay his share for the work which has been done by his co-owners, his right and interest in the claim may be forfeited to such co-owners under the provisions of the statute. (3) His interest in the claim may also be forfeited by his abandonment, with an intention to renounce his right of possession. It cannot be doubted that an actual abandonment of possession by a locator of a mining claim, such as would work an abandonment of any other easement, would terminate all the right of possession which the locator then had."

The leading mining schools and colleges throughout the country report large accession to the number enrolled. The drift of young men toward mining engineering is illustrated in the increase in the number taking the mining course in the University of California, at Berkeley, Cal., which from 5 in 1892 has grown to 190 in 1900.

Concentrates.

COIN SILVER contains 7% copper.

A 10-FOOT head of water would give a pressure of about 4⅓ pounds per square inch.

THE census of 1900 gives Idaho about 160,000 population.

A CISTERN 9½ feet inside diameter and 12 feet deep will hold 200 barrels.

SIXTEEN gravity oil could be sold f. o. b. Los Angeles, Cal., at $1.25 per barrel.

THERE is no California State tax on the issue of certificates of corporation stock.

THE temperature of steam at 125 pounds per square inch gauge pressure is about 352° F.

BETWEEN 60° and 70° F. is by some millmen considered the best temperature for battery water.

A "MACHINE" may be defined as a mechanical device that will transmit and modify motion and force.

LEAD and aluminum do not alloy. Equal parts by weight of silver and aluminum give an alloy as hard as bronze.

TO RUN 2500 miner's inches of water, a sluice box set on a 5% grade should be 5 feet wide, 32 inches deep and 14 feet long.

THERE is an unavoidable loss of gold in all placer mining. Where it is extremely fine, such loss has run as high as 40%.

IN making steam, weight for weight, it is the result of experiment that wood has two-fifths the evaporative power of coal.

A LOSES: $1000 in silver quarters, halves and dimes weighs 803¾ ounces; $1000 in standard silver dollars weighs 859⅜ ounces.

THE American-built Russian cruiser Variag is the fastest vessel afloat of any considerable size. She has a record run of 27.25 miles per hour.

A MINING LOCATION can not be considered other than a prospect until it is proved susceptible of yielding a profit by being worked. Then it may be styled a mine.

THE price of borts for diamond drills has greatly appreciated. Formerly $12, $14 and $16 per carat were the ruling rates. They are now quoted in some cases as high as $50.

WITH the $20 payable on the 28th inst.—the 116th dividend declared by the Calumet & Hecla Co.—the total dividend disbursements of that company will aggregate $70,850,000.

SILICON COPPER is an 85% copper alloy with metallic silicon 15%, and is usually added to molten copper before casting to preclude any blowholes or flaws in the ingots or wire bars.

SUBJECTED to the action of liquid air, lead becomes elastic and can be made to rebound or serve as a spiral spring during the continuance of such extraordinarily low temperature.

THE American Nickel Works, Camden, N. J., reduces cobalt ores. The chief market for it is as cobalt oxide for coloring. The prepared article, 98%, is worth about $8 per kilogram.

WITH an 8-inch drop a stamp will take .22 second to drop. With a cam lift, 7 inches, ninety drops per minute, the time of the lift is .297 second; of the lift and drop together .667 second.

IN Colorado a mining claim must be recorded within ninety days of the date of discovery with the county clerk and recorder of the county in which the claim is located. The matter of record is subject to local laws.

THE economy of a gas engine is exemplified in the fact that the gas consumed in one sixteen-candle power gas jet, if consumed in a gas engine, is capable of producing three sixteen-candle power incandescent electric lights.

AIR at sea level at a temperature of 80° F., half filled with moisture, has 11 grams of water vapor to each kilogram of air. If the temperature be lowered 15° through a change in the pressure, the air will become saturated with water vapor.

A MILLSITE can be legally located on non-mineral land. If, before patent issues, mineral is discovered on a located millsite, a valid mining location could be made thereon, if solely for that purpose, peaceably and in good faith. See page 313, "Mills and Mill Sites."

THERE are two kinds of men: those who go ahead and do the things they are expected to do, or are paid to do, and those who always have the best of excuses for their continued failures. And the man who is good at making excuses is rarely good for anything else.

TO keep machinery from rusting dissolve one ounce camphor in one pound melted lard; remove the scum; mix in as much fine black lead as will give it "an iron color"; clean the machinery, smear with the mixture; after twenty-four hours rub off and polish with soft cloth.

THE dry sheet on a tubular boiler is that part of the first sheet in a boiler that is not covered by water on one side, and is supposed to be protected from the fire on the other side by the brickwork in the furnace, but which is sometimes moved on account of the arch having partially fallen down.

PUNCHED-SLOT STEEL SCREENS are recommended by some millmen for battery service in amalgamating fine gold. Experiment best determines the most economical requirements, "economy" meaning that which gives the most profitable results.

IN the production of phosphorus by means of the electrical furnace a mixture of phosphate of lime and coke is first reduced to powder and then heated. When the mass becomes pasty all the openings of the furnace are sealed except one through which the vapor passes. This vapor is collected and distilled.

ANY good mining machinery firm will gladly furnish a fine catalogue or trade treatise on any specified requirement upon request, and, if the writer means business, will also furnish detailed information as to individual needs, with estimates. Where the contemplated plant is of magnitude a personal visit is more satisfactory.

STEAM at five pounds gauge pressure has a temperature of 228° F.; at sixty pounds gauge pressure, 307°; the difference is 79. As the specific heat of steam is .475, the temperature will be raised as many degrees as .475 is contained in 79, or 165; the temperature of the steam after it passes the reducing valve is thus $228+165=393°$.

ONE of California's "dead rivers" is the "Big Blue Lead," the course of which has been traced about 65 miles, paralleling the main divide of the Sierra Nevadas and about 30 miles west. It trends at right angles to the course of the present streams. It is capped with lava at various depths, and has yielded about $100,000,000.

A GOOD formula for making blue prints of maps is as follows: Take iron and ammonium citrate saturated, 1 ounce; water, 4 ounces. Mix this solution separately; then mix another solution composed of potassium ferrocyanide and water, 4 ounces. When desired for use, mix equal quantities and float the paper therein for two minutes.

ALUMINUM may be silvered or gilded as follows: The article is first covered with a coating of the following liquid: One quart water, 2 ounces glycerine, 1 ounce cyanide of zinc, 1 ounce iodide of zinc. After being in contact for an hour, the article is heated red hot (752° F.). It is then cooled, washed in water with a hard brush, and then put into a silver or gold galvanic bath.

PATENTS have been granted on hardening copper, and the claim has been made that the hardened copper can be tempered. The last patent so granted was No. 587,861, to J. Reuter, Aug. 10, 1897, which, in brief, is to enclose the piece of copper to be hardened in a covering of clay, saturate with vinegar, subject the clay containing the copper to a high degree of heat and finally submerge the whole in water.

AS A SUBSTITUTE for hydrochloric acid in the Etard process of gold recovery, Dr. Black of Otago, N. Z., says that sulphuric acid, together with common salt in combination with permanganate of potash, will extract gold as well as the Etard process, and more quickly. In working gold ores, he claims to have extracted 92% of the gold contents in fifteen hours by percolation and in five hours by agitation, using the solution specified.

THERE is no claim to absolute correctness nor any assumption of infallibility in any statement made at any time on this page. The brief condensations that weekly appear are mainly in answer to numerous questions, and are designed to give in as concentrated form as possible suitable answer to those who evidently want information on questions they send that arise in their daily working life. There are doubtless mistakes and misstatements, but probably the percentage of such incorrectness is as small as in any other effort of the kind. There is no pride of authorship, and "Concentrates" at all times takes it as a favor and a kindness to have indicated where in any item there is a manifest lapse from accuracy or correct statement. The main point is to get things right, and everybody is wiser than anybody.

WITH belts to transmit a given power there must be so many cubic inches of belt pass any given point in a given time. To do this one must either run a large belt slowly or a small belt quickly. The product of area and velocity must be constant. The bending force varies as the breadth and as the square of the thickness and as the amount of bend, a 2-inch belt offers simply twice the resistance of a 1-inch belt; a belt ¼ inch thick offers four times the resistance of one only ⅛ inch thick. Hence a 1-inch belt of a quarter thickness has double the resistance of a belt 2 inches by one-eighth. Yet they are equal in area. In respect of shafts their resistance varies as their speed and diameter, and their power varies as their speed and as the cube of their diameters. Thus, a 2-inch shaft is eight times as powerful as a 1-inch shaft.

THE essential difference between a marble and a compact common limestone is that the first has undergone, through the combined action of heat and pressure, just the right degree of change, or metamorphism, to develop in it crystallization and color. The essential difference between a brick or fire clay, and a cleavable slate used for roofing, is that the first named still retains its plastic condition as it was laid down in the form of fine silt on a sea bottom, while the slate has, by geological agencies, and by actual movements of the earth's crust, become so squeezed and compressed as to have lost all resemblance to its former self, and to become the cleavable article of commerce we now find it. Since these processes of change are dependent very largely upon the actual movements, warpings and foldings, as may be said, of the earth's crust, and the heat and chemical action which is thereby generated, and since these movements only take place with extreme slowness, whole geologic ages being occupied in their conception and completion, it follows, as a matter of course, that metamorphic rocks, like granites, marbles and slates, are found only among the older rocks, and only in those portions of the country where this crust has been wrapped, compressed and folded, as in the process of mountain making. In other words, these rocks are to be expected in their best development only in places bordering along more or less extensive mountain ranges.

A "SIPHON" whose diameter is probably as large as any in the world is located near Boise City, Idaho, and carries the water of Sheep creek across the Boise river. This 48-inch siphon is inverted; is 1700 feet long, maximum depression 350 feet; cost $36,700 and took four months and twenty days to build. Owing to the topography of the country, everything used in its construction had first to be raised 700 feet and then lowered 450 feet. The lightest piece of material handled weighed 3100 pounds. The whole force of water was turned on into the siphon suddenly and at once, not gradually, as is the usual custom. The pipe line of the Spring Valley Hydraulic M. Co. at Cherokee, Cal., has an approximate inner diameter of 30 inches, discharging 52 cubic feet of water a second. At its greatest depression the Cherokee siphon sustains a depression of 887 feet—530 feet greater than at Boise City, where the greatest pressure sustained in its lower portion is 167 pounds to the square inch. In the Boise City line there never has been any tendency to move or any leak, in spite of the pressure. To admit of contraction and expansion without any derangement in position, the engineer invented expansion joints placed between each two elbows, the average movement during the course of construction of the pipe line in all of these expansion joints was ⅞ of an inch between the extremes of temperature of night and day. The pipe being laid on the side of the hill, part of it at an angle of 45°, this movement in the pipe line, if these expansion joints had not been used, would either have deranged the position of the pipe or strained its riveting.

WIRE ROPES are as flexible as new hemp ropes of equal strength and more efficient as standing ropes, being uninfluenced by weather and more durable in hoisting. It is always advisable to use the largest practicable drums, sheaves or pulleys, and to avoid high velocities, as ropes so used will last much longer. A strain of one-seventh of the breaking strain may be taken as a safe working load, though for standing ropes this may be exceeded. The durability of steel wire rope is estimated to be 30% greater than that of ropes made of iron wire. To preserve wire rope from wear or exposure cover it thickly with linseed oil, or with paint formed of equal parts linseed oil and Spanish brown or lampblack. If used under water or under ground a good preservative is made by adding to one barrel of Swedish or Stockholm tar one bushel of fresh slacked lime; boil well, and while hot saturate the rope. Sawdust or oat meal is sometimes added with good effect. Wire rope must not be coiled or uncoiled like hemp rope. It should be unwound as from a reel, to prevent kinking. It is always advisable to line the grooves of the cast-iron pulleys in which the rope runs with wood (set on end), leather or rubber. In the use of wire rope for transmitting power this is imperative, because of the great velocity with which the ropes run. Avoid, if possible, overlapping of wire rope on drums. For shafts and elevators the load lifted should not be more than one-tenth of the strength of the rope. For wire rope to be exposed to intense heat wire core may be substituted for the ordinary hemp center. The grooves on drums and sheaves should be a trifle larger than the rope, perfectly smooth and uniform to the surface of the rope. Wire ropes should run around all sheaves without chafing the sides of the grooves.

WHAT is sometimes called "verdigris," a green or green-gray film forming on copper plates, often showing various colors, is due to the oxidation of copper in the amalgam; or it may be due partly to the effect of sulphates in the ore, in which case it would be partly a basic sulphate of copper. On good electro-silver plated copper plates it is rarely seen. It tends to cause a loss of gold in amalgamation. When it appears the stamps should be hung up and the copper plates cleaned. This may be done with ammonia, a solution of caustic soda or potash, or a dilute solution of cyanide of potassium. After removal, a little more quicksilver should be rubbed in. If it then appears it should be removed as before, all the amalgam scraped off and a good coating of silver amalgam rubbed in. If pure silver can be obtained, this silver amalgam can be easily made by using about three parts of silver to one of quicksilver. It requires about one-fourth ounce of amalgam to each square foot of surface to be amalgamated. If pure silver cannot be obtained, a good way to make it is to use silver dollars. Dissolve them in a porcelain evaporating dish, or any chinaware dish if such be not at hand, in dilute nitric acid, and evaporate it to dryness over hot water, or a water bath. Heat the dry mass gently till it fuses, and all the bluish tinge in it is changed to a grayish black. When this point is reached the copper alloy in the silver coin will be changed to an insoluble oxide. Then dissolve all that will dissolve in a very little water, and filter into a glass jar. To this add the quicksilver required, and drop in a few bright nails or other iron. The silver will be deposited as metallic silver and form amalgam with the quicksilver, and in two or three days it will be complete and ready to use without other care. It is a good idea to always use silver amalgam on the plates, rather than pure quicksilver, as it keeps the surface cleaner and, some mill men say, causes a better saving of the gold.

California Crude Petroleum as a Fuel.

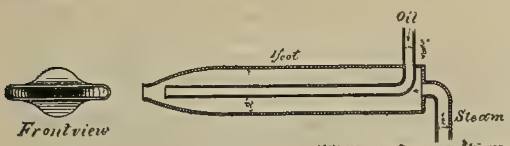
By ERNEST H DENICKE, College of Mining, University of California.

When crude oil was first used as a fuel the flame was shot directly against the flues, which in a short time seriously injured them, and it was thought that oil could not be successfully used. It was also looked upon as a dangerous substance, and these things, together with the usual aversion to adopting entirely new methods, made the adoption of oil as a fuel slow. The pioneers in the use of crude oil as fuel on this coast probably are the California Powder Works; oil has been burned with commercial success at their works, near Pinole, for over thirteen years. At first Peruvian oil was used, but now California oil is used and preferred for several reasons.

The oils of California can be roughly divided into three classes: the thick, heavy oil of the Los Angeles district; the lighter oil of Ventura, and the very light, liquid oil of Coalinga, southwest of Fresno. The first two are carbon oils (because of their high carbon content) with an asphaltum base, unlike the Eastern oil, which has a paraffine base. The California oils have some paraffine, but very little. The Coalinga oil is peculiar, in many respects resembling the Peruvian oil. It is remarkably light and liquid—nearly as liquid as refined coal oil—very volatile, evaporating nearly 10% per day, and does not seem to be a mixture of several hydrocarbons, as most coal oils are. It is a hydrogen oil.

The gravity of the Los Angeles oil is from 12° to 19° Baume, and sometimes as low as 10°; the Ventura oil is 21° to 24°; Coalinga oil about 35°, and the Peruvian oil about 30° Baume. The volatility of the Coalinga oil as compared to the Ventura oil is as 11 to 6. Oils that evaporate to a marked extent are in a measure dangerous, for the vapors are explosive; therefore, it is best to store crude oil in gas and oil-tight tanks of steel.

There is difference of opinion as to which is the best method of burning the oil, and no one method can be called the best, because of the great variety of conditions and boilers. Many patents have been taken out on oil-burner designs, and some of these will work well in one furnace but fail in another. So, in selecting a burner, it is best to experiment, for one will meet existing conditions better than another. Mr. Palmer, the manager of the Union Oil Refinery, who is an authority on fuel oil, claims that the simple pipe burner will give the best "all-around" results. This burner is of simple construction and can be made of a few pieces of ordinary pipe by any good machinist. (See Fig. 1.)

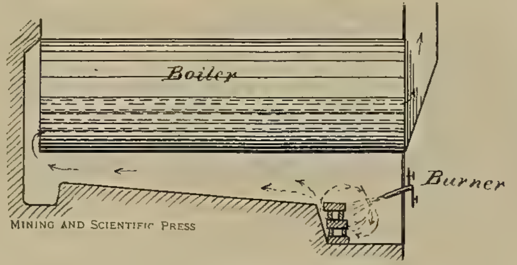


MINING AND SCIENTIFIC PRESS

FIG. 1.

The end of the outer pipe is drawn out and flattened, so as to make a fan-shaped slit, a little larger than the cross-section of a 25-cent piece. Mr. Palmer also claims that the highest efficiency will be gotten out of the Los Angeles and Ventura oils when they are forced into the burner under a head of 20–5 feet and when about 5% of the generated steam is used to blow the oil. These figures will vary, of course, with the kind and quality of the oil. When 5% steam is used with the above oils, a good "white" flame is obtained, and a less amount of steam will give a red, smoky flame, in which little particles of oil can be seen burning. Different oils vary greatly in their heating effect, dependent upon their chemical composition. In rough figures, 130 gallons of Eastern oil — 1 ton of coal; 600 gallons = 11 cords of wood, (maple, which is about the same as California mountain oak). At the California Powder Works it was found that 1 pound of Ventura oil = 1.7 pounds good coal. The calorific intensity of a carbon oil is higher than that of a hydrogen oil. Temperatures obtainable by burning in air with close adjustment are about 2000° carbon and 1750° hydrogen. An excess of air must be used in practice.

At the California Powder Works oil is used as fuel for making steam and in the manufacture of chemicals for dynamite making. The oil is pumped through an underground pipe from the Union Oil Company's Refinery, above Rodeo, and is stored in tanks made of old glycerine tanks. These tanks have one end cut out and are loosely closed by a wooden top, covered with burlap. From here the oil is discharged to the various furnaces at a head of about 22 feet. About 5% of steam is used to blow. Saving is effected in both price of fuel and in the amount of labor needed. When the furnaces are once lit they need practically no attention, except an occasional glance to see that the proper flame is obtained. The boilers are ordinary tubular boilers, four in number. The flame is shot under the boilers into what might be called a brick box against a target, consisting of a grating of firebrick. The accompanying sketch will explain. (See Fig. 2.)



MINING AND SCIENTIFIC PRESS

FIG. 2.

Mr. Palmer recommends this type of construction, but says that the grating of firebrick is not necessary. He says that the burner should point down, as in the accompanying sketch, and should strike against the back of the box as a target. The effect of the deep box is to form a vortex, as indicated by the arrows, and gives plenty of time for complete combustion. Complete combustion is an important factor and deserves more attention than is given to it. To make a test of this, it is necessary to use a pyrometer at various places in the boiler and furnace and to analyze the escaping gases. When this is done many defects of the furnace can be remedied, the loss can be located and a great saving of fuel effected.

The only objection to the above method of furnace construction is that it necessitates the removal of the grate bars and a partial bricking-up of the firebox. Should the supply of oil be accidentally stopped, the boilers would have to be shut down so as to allow the rebuilding of the firebox to suit coal burning. Where the grating and layer of firebrick are laid directly upon grate bars, it takes half an hour at the utmost to change back to coal burning. Of course, the latter method is not as economical as the first, but, on the whole, it is preferable, and the slight increase in cost may be set down as insurance on the oil supply.

The Western Sugar Refinery of San Francisco probably uses more crude oil than any other establishment on the Pacific coast, for there 700 barrels of Coalinga oil are burned per day, and the consumption will be largely increased within the next few months. The boiler plant consists of thirty-two modified Gallaway boilers; twenty-two of these are 6 feet 6 inches in diameter by 21 feet long, and have 27½ square feet of grate surface. Each boiler has 113 3-inch tubes, giving 688 square feet of heating surface. The ten other boilers are 6 feet 6 inches in diameter by 26 feet long, have the same grate surface and ninety-six 3½-inch tubes, giving a heating surface of 1098 square feet. The plant is rated at 2540 H. P., but 4340 H. P. are obtained. There are also three Green economizers, which heat the feed water—two with 432 pipes and one with 360 pipes.

While coal was being burned, forced draught was supplied by a 4x6-foot Sturtevant blower, driven by two 11½x16 engines. One of these engines was used as an auxiliary. The oil is received in tank cars direct from Coalinga, the cars containing from 6000 to 6500 gallons. The Southern Pacific cars are all uniform, containing 6525 gallons, and the Union Tank Line cars vary as above. Contract price for the oil is $1.30 per barrel, delivered, (42 gallons per barrel, weighing 301.33 pounds).

Seven cars are coupled on to pipes along the track and the oil flows by gravity to a small centrifugal pump, driven by an electrical motor, which pumps the oil into closed steel storage tanks of 10,000 barrels each. These storage tanks are surrounded by a concrete dam wall, the space enclosed containing a little more than the contents of one tank. From these main storage tanks the oil flows by gravity to a small underground tank near the fire-room. Here the oil is pumped into two 3-inch stand pipes by two pumps. The stand pipes overflow at 52 feet, the oil running back to the tank; but the pumps are regulated to 48 feet by Mason regulating valves, which regulate to 6 inches. Larger stand pipes are not allowed by the insurance companies. The boilers are arranged in two rows, facing each other, and the oil pipe, from stand pipe, runs along the front of them. Each stand pipe supplies a separate row, but could supply both rows in case of accident. At a distance of every three boilers these two feed pipes are connected with a cross-arm pipe, so that in case an accident happens to one of the boilers three of them can be instantly cut out without stopping the plant for a moment. This alone is a great advantage over a coal fire, for it takes some time to "pull" a big fire. The stand pipes, pumps and feed pipes are all set up in duplicate, so that an accident can not stop the plant. A network of firebrick set on edge is laid directly upon the grate bars, and against this the oil flame is shot. If anything should happen to the oil supply, this network can be removed and a coal fire started within twenty-five minutes, by actual practical trial. When oil was first used it was blown with 2% or 3% of generated steam, but this gave an imperfect flame and set up a vibration. Now 8% is used and a bunsen flame is obtained with little vibration.

As can be seen by some of the following tables, the fire-room cost of handling the oil is less than a third of that of coal. Besides, there are no ashes, no smoke, absolutely no dirt, and less heat is lost by radiation. The furnace doors are never opened, so no cold air is allowed to strike the boiler, which makes a difference in boiler repair. The flues need practically no cleaning, and the absence of soot gives a better heating power. When coal was used as fuel, twenty-six firemen were employed; now, twelve are needed. Oil fuel allows the use of a peculiar little device which makes a saving in fuel. It is known as a "retarder," and consists simply of a strip of twisted sheet iron, which is placed in the boiler flue. (See Fig. 3.) This not only retards the draught and allows the flame more time, but also revolves and "stirs," if the term may be used, the heated gases. Gases are very poor conductors of heat, and, if they are allowed to go straight through the flues, only a little more than the outer part of the currents is cooled; but the retarders twist the gas currents, bringing more of the heated gas into contact with the flues. They can not be used in a coal fire on account of the soot.

(TO BE CONTINUED.)

The Estimation of Copper in Ores by the Modified Cyanide Process.

Written for the MINING AND SCIENTIFIC PRESS.

The general activity in copper mining of late years has revived interest in the methods for determining the amount of copper in copper ores. After several years' experience in actual practice, and in the class room as a teacher, I am convinced that the method hereinafter described is the simplest and most accurate method known for determining the amount of copper in an ore. The majority of persons called upon to determine copper are not expert chemists, and it is with reference to this class of workers that I make the above statement.

There are several well-known methods for quantitative copper analysis, the most generally accepted method being the electrolytic method.

ELECTROLYTIC METHOD.—This is generally credited with being a more reliable method than it really is. For years it has been considered the standard method, and it may still be so considered when manipulated by acknowledged reliable chemists. The following list of restrictions and limitations will make the latter statement more convincing:

1. A uniform voltage must be maintained throughout the determination.
2. Do not use too high a voltage—it will deposit spongy copper. Zinc will also be deposited if present above 3%.
3. Do not stop before all the copper is deposited.
4. Do not continue after all the copper is deposited.
5. Do not have the solution too strong with nitric acid—it will keep some copper in solution indefinitely.
6. Do not use too much sulphuric acid—it will deposit spongy copper.
7. Remove bismuth if present, otherwise it will deposit with the copper.
8. Lead is deposited with copper if present.
9. Arsenic must be removed or it will be deposited with the copper.

It is evident that one must know all the mineral constituents of his ore, and also the approximate amount of copper in it, in order to be certain of his result. This is requiring too much of the average chemist or assayer.

THE IODIDE METHOD.—This is an excellent method and very accurate, but it is cumbersome in the hands of some assayers and unskilled chemists.

THE ORDINARY CYANIDE METHOD.—In this method iron, which is usually present in copper ores, is precipitated by ammonia hydrate and filtered out. The precipitate of iron hydrate always contains considerable copper, making the result low. Besides, if an excess of ammonia hydrate be used, it will make the result too high. Arsenic, zinc, antimony, etc., must be removed. Too much nitric or hydrochloric acid lower the result. If the iron precipitate be redissolved and reprecipitated it will produce an excessive amount of ammonium nitrate (or chloride) which, in turn, will react on the cyanide, giving too high a result.

THE MODIFIED POTASSIUM CYANIDE METHOD.—This is sometimes called the "aluminum strip" method.

I have added several precautions and details of my own which I trust will be of service.

This method is dependent upon the following chemical reaction, in which the copper unites with the potassium cyanide, forming the double salt of copper-potassium-cyanide:

$$CuSO_4 + 4KCN = CuK_2(CN)_4 + K_2SO_4$$

The atom of copper in the molecule of copper sulphate reacts with four molecules of potassium cyanide. The one atom of copper weighs 63 microcriths and the four molecules of cyanide of potassium weigh 260.4 microcriths. K = 39.1; C = 12; N = 14. $(39.1 + 12 + 14) \times 4 = 260.4$. As 63 m.c. of Cu requires 260.4 m.c. of KCN, 1 gram of Cu would require 4.1 grams of KCN. 63 m.c. : 264.4 m.c. : : 1 gm. : x gms.

It is evident, therefore, that if a solution of KCN be made to contain 4.1 grains of KCN to each 100 c.c. of solution and 1 gram of ore be taken for analysis, each c.c. of KCN solution required in the titration will represent 1% of copper in the ore.

As chemically pure KCN cannot be obtained, it is necessary for us to use chemically pure copper with which to standardize the KCN solution.

The details of the various operations are as follows:

To Make the Standard Copper Solution.—

1. Wash a little over 1 gram of chemically pure copper in hot, moderately concentrated nitric acid. Wash several times in distilled water and dry slowly, so as not to form a coating of copper oxide on the pieces.

2. Weigh out exactly 1 gram and dissolve in 25 c.c. of C.P. nitric acid. Use a tall beaker and keep it covered with a watch glass to prevent the spray falling outside (a frequent source of loss). Heat may be used.

3. Wash the solution into a litre flask and dilute at once to exactly 1 litre (= 1000 c.c.), using cold (63° Fahr.) distilled water. Mix well.

4. This standard copper solution can be kept indefinitely in a bottle for future use. Do not add any more water to it in any case, as it is your standard.

The Potassium Cyanide Solution.—

1. Dissolve about 42 grams of the best commercial KCN in 1 litre of distilled cold water (63° Fahr.).

2. Decant or filter out any "pus" or sediment, standardize and bottle for future use. Keep it in a dark place.

Though the solution gradually loses strength, owing to the decomposition of the KCN, it will not materially change in one month if distilled water has been used.

Standardizing the KCN Solution.—

1. Take two 100 c.c. burettes. Wash one out with the standard copper solution and the other with the KCN solution. Discard the washings.

2. Fill the Cu burette with standard copper solution and run off to the zero mark. (A graduated cylinder can be used in place of the burette for the copper if desired.)

3. Place at least 15 c.c. of the KCN solution in the KCN burette.

4. Run the 100 c.c. of copper solution into a beaker and add just enough ammonium hydrate to produce a deep blue color—no more—say 5 c.c.

5. Add about 7 c.c. or 8 c.c. of the KCN solution at once, then continue by adding only a drop at a time, carefully stirring the copper solution to insure a thorough admixture, until the blue color disappears and a pink color appears. A white background will assist in determining the end of reaction.

6. Make several confirmatory tests.

7. Multiply the result by 10 to ascertain how much KCN solution would be required for the entire gram of copper. The result will usually be from 95 to 105. This number we will call the "cyanide standard number." For greater accuracy 200 c.c. or 400 c.c. of standard copper solution can be used in standardizing the KCN.

The Ore Sample.—

1. Pulverize a dry sample of copper ore to about 60 or 80 mesh and weigh exactly 1 gram.

2. Place it in a deep evaporating dish on a sand bath and add 10 c.c. to 15 c.c. of strong HNO_3. Cover with a watch glass, but place a glass rod under the glass to permit evaporation.

3. Evaporate nearly or quite to dryness and add 5 c.c. of HC1.

4. Evaporate nearly to dryness.

5. Add 10 c.c. strong H_2SO_4.

6. Evaporate till very copious; choking fumes are given off, indicating that the H_2SO_4 has expelled all the HNO_3 and HC1. Enough H_2SO_4 should be added to produce strong fumes without evaporating to dryness.

7. Cool and add about 50 c.c. or 60 c.c. of water.

8. Filter into a tall beaker and place on a wire gauze over a bunsen flame.

9. Add a strip of metallic aluminum, 2″x1″x⅛″ in size and bent thus: 
10. Boil five minutes (not simply "boiling hot"). This will precipitate all the copper in the metallic state.

11. Add about 25 c.c. of cold water.

12. Decant through a filter, retaining as much of the precipitated copper in the beaker as possible. Wash the copper three times by adding distilled water and decanting through the same filter paper. Throw away the filtrate and washings.

13. Carefully place the aluminum strip on the filter paper and put the beaker containing the copper under the filter. With an ink dropper or a pipette drop strong HNO_3 on all sides of the aluminum strip to dissolve off all adhering copper. Also dissolve all copper off the filter paper, then add just sufficient HNO_3 to dissolve all copper in the beaker below, but do not add an excessive amount.

14. Wash filter paper and aluminum strip with distilled water and dilute the solution to 75 c.c. or 100 c.c., according to the richness of the ore.

15. Cool thoroughly.

16. Add just enough NH_4OH to give a deep blue color—no more.

17. Place the beaker on a sheet of white paper, under the KCN burette, and add KCN till the color just begins to fade.

[If there is a heavy precipitate of aluminum hydrate, quickly filter and wash filter, and then continue titrating to end of reaction. It is better to remove the precipitate after adding nearly a sufficiency of KCN rather than to remove it before beginning to titrate.]

18. Finish the titration to the same shade of pink obtained in standardizing the KCN solution.

19. Multiply the number of c.c. used by 100 and divide by the "cyanide standard number." The quotient will be the per cent of copper in the ore.

Examples.—Suppose, in making up our standard KCN solution and testing the same, 100 c.c. of our standard copper solution required 9.4 c.c. of KCN, then $9.4 \times 10 = 94$, our "cyanide standard number."

Suppose 1 gram of ore be treated and that 31 c.c. of KCN is required in the titration. We then make use of the following proportion:

$$94 \text{ c.c.} : 100\% :: 31 \text{ c.c.} : X\%$$

$$\frac{100 \times 31}{94} = 32.9\%$$

Another Example.—Suppose our "standard cyanide number" is 102, and that a sample of copper ore required 15.3 c.c., 2 grams of ore being taken for a sample (presumably a low-grade ore):

$$102 \text{ c.c.} : 100\% :: 15.3 \text{ c.c.} : X\%$$

$$\frac{15.3 \times 100}{102 \times 2} = 7.1\%$$

Remarks.—In reference to paragraph 6 above, it should be borne in mind that sulphur trioxide fumes must be evolved very copiously to insure the absence of all HNO_3 and HC1, which, if present, will prevent the precipitation of the copper by the aluminum strip. If you evaporate to dryness to get the fumes, some of the copper may assume an insoluble form. If, in filtering under paragraph 8 above, the filter paper is destroyed, it is evidence you did not dilute the retaining H_2SO_4 sufficiently.

San Francisco. O. H. Packer, M. E., C. E.

Branch Carrying Pipes.

The carrying capacity of a pipe is not in proportion to its internal area. A pipe 4 feet in diameter has only four times the area of a pipe 2 feet in diameter, and yet the 4-foot pipe will carry 5.66 times as much fluid as the 2-foot pipe, under the same conditions of length and head. In other words, a 2-foot pipe will carry 17.6%, or nearly 18% as much as will a 4-foot pipe. This proportion of carrying capacity does not hold good for smaller pipes of the same proportionate diameter. A 1-foot pipe has only 16.6% of the carrying capacity of a pipe 2 feet in diameter, and a 1-inch pipe will carry only 14% as much as a 2-inch pipe. A 6-inch pipe can have 15% of its capacity carried by a 3-inch pipe, 23% by a 3½-inch pipe, 34% by a 4-inch pipe, and a 24-inch pipe will carry thirty-eight times as much as the 6-inch pipe.

In taking branches from a main, it is advisable that the sum of the percentages of the carrying capacities of the branches should be 100% or more. Referring again to a 6-inch main, if it be divided into two branches—one 4 inches and the other 5 inches—the carrying capacities of the branches would be respectively 34% and 63% of the 6-inch pipe. Thus provision is made for only 97%, and there would be slight additional friction from the point of diversion of the branches. If the branches be made 4½ and 5 inches, the percentages are respectively 47 and 63, their sum 110, and from the junction the flow would be considerably more free than in the first case.

California Oil Wells.

There were on Sept. 1st 1439 rigs and wells drilling reported in all fields. The greatest increase in new work is noticeable in the central district. The Los Angeles field comes second in number of wells begun. The northern district, including San Mateo, Monterey, Colusa, San Benito, Humboldt and Contra Costa counties, shows a gain in new work. In the central district, which includes Fresno, Kern and Kings counties, on Aug. 1st ninety wells were reported drilling and rigs up. This number was increased during the month to a total of 176, of which 91 are in the Kern river field alone and 29 in the Sunset field. In the coast district, which covers San Luis Obispo, Santa Barbara and Ventura counties, forty-one wells were reported under way Aug. 1st; on the 1st inst. this district showed ninety-two rigs and wells drilling. The southern district, including Los Angeles, Orange, Riverside and San Diego counties, showed 120 rigs and wells drilling Aug. 1st. This number was increased during the month by 32, making a total of 152 under way.

Location of Mining Claims.

Under the Act of Congress (Rev. St., Sec. 2319-2324), a lode claim can not exceed 1500 feet in length by 600 feet in width, and should be in the form of a parallelogram having its side lines equidistant from the center of the lode, with end lines parallel to each other.

A lode is a zone, belt or body of quartz or other rock lodged in the earth's crust, and presenting two essential and inherent characteristics, viz: (1.) It must be held in place within or by the adjoining rock; and (2) it must be impregnated with some of the minerals or valuable deposits mentioned in the statute, and which will authorize the location of a lode claim.

In locating a mining claim all that the statute requires is that the location shall be distinctly marked on the ground so that its boundaries can be readily traced. Whether any markings have been made, and and whether they are such that the boundaries of the location can be readily traced, are questions of fact.

The statute does not require any record of the location, but when one is made it prescribes what it shall contain, viz: that the name of the locator, the date of the location, and such description of the claim by proper references as will identify the claim, the principal object of the record is the identification of the claim; and, if, considering everything it contains, the name of locator, date and description by reference to same natural object or permanent monument, the claim can be identified, the record is sufficient.

No notice of location is required by the statute, but when the same is posted on the ground it must be considered as a marking to aid in tracing the boundaries. When such notice contains a description of the claim and is recorded, it operates as constructive notice that the locator claims the ground described. The description as shown by the record will ordinarily bind the locator as to the locus of the claim; but where the distances and courses set out in the description vary from the monuments or markings made on the ground, the latter prevail and will determine the locus of the claim.

The effect of a valid location is to segregate from the public lands the grounds located, and the prior location gives the prior and better right. A valid location vests in the locator the exclusive right of possession and enjoyment of the ground located, together with all the lodes therein.

The maxim that one may recover on the strength of his own title does not apply in the case of a naked trespasser or intruder, although the party in possession may have a defective location; in such case the latter's possession alone is sufficient to maintain ejectment.

Mills and Mill Sites.

To the Editor:—Will you please answer the following and oblige a subscriber:

A owns a mill on a certain creek but does not own the ground on which the mill stands. B locates a millsite, taking in A's mill, and gives him written notice to remove the mill within thirty days, which A fails to do. B now claims the mill. Is he right?

Cherry Creek, Nev., Sept. 4. Prospector.

The question can not be answered from the standpoint of adjudicated cases except tentatively. The land being non-mineral it might have been appropriated by A, either in connection with a located lode, or under the last clause of Section 2337 of the Revised Statutes, relating to the construction of a quartz mill or reduction works regardless of lode ownership. In the latter case it would seem that the construction of a mill upon the land would segregate it from the public domain, and prevent its relocation by others for millsite purposes. Certainly A is not a trespasser when he goes upon the land and constructs the mill if the land is public and non-mineral; he has rights which the Government would recognize. It is quite likely that the relocator would also have to recognize these rights. The case is quite different from the location of a millsite on mineral lands which are subsequently located by a prospector as a mining claim, in which instance the mill would probably fall to the mining locator.

Questions of this character are extremely close and should be solved by a good lawyer, who should be put into the possession of all the facts. As a matter of first impression we would say that A being the first comer, the land being non-mineral, the erection of the mill secures to A the right to the occupancy of the land as against B, seeking to claim the land for the same purposes. Under such circumstances B could not take A's mill or compel him to remove it,

Boiler Explosions — Cause and Remedy.

The only explosive material about a steam boiler is water. Water, when superheated, will explode upon a sudden removal of pressure with a force equal to that of dynamite.

The boiling point of water varies with pressure. In a vacuum water boils at 70° F. sensible heat. Under atmospheric pressure it boils at 212° F., and cannot be made hotter unless confined under additional pressure, because the escaping steam carries off the heat as fast as fire can impart it. In a steam boiler under 10 pounds pressure it boils at 241°; 50 pounds, 300°; 100 pounds, 340°; 200 pounds, 389°.

Water when heated to the boiling point requires 966° additional heat to change it from the state of water to the state of steam. This change is substantially instantaneous at all pressures. As each molecule of water absorbs the last of the 966° it instantly explodes into steam. As the last degree is absorbed, cohesion is overcome and repulsion becomes the predominant power. The change of steam to water is also instantaneous. Steam remains in its new state only so long as it retains the 966° of latent heat, and the moment it is at full volume, with only 212° of sensible heat, parts with one of these degrees of latent heat it returns to water.

The explosion of water is similar to that of gunpowder in some respects, but different in others. Each grain of gunpowder passing from the solid to the gaseous state explodes when it has absorbed a certain degree of heat; so with water. Each molecule of water, at the instant it has absorbed 966° of heat above the boiling point, explodes and passes from water into steam. The expansive quality of the two is different, powder increasing in bulk 800 times, while water increases 1720 times. The mode of exploding and the general result, large and sudden increase of bulk, are similar. In other respects they differ widely. The explosion of powder is by chemical action; the explosion of water is a physical change only. Water differs widely from powder and all other explosives in another remarkable particular. Only a portion of the water may explode—one molecule, the half, or the whole mass. These various amounts in exploding produce results ranging from violent explosions to mild ruptures and the safe operation of the boiler.

When a grain of powder starts to go from the solid to the gaseous state no power can stop it. It may be confined, but combustion, once begun, goes on to completion. So with a molecule of water. It may be put under such a pressure that it will not fully expand, but, once begun, it changes its state from water to steam.

The true source of the development of the great destructive power in a steam boiler is the sudden concentration of the sensible heat in the water above 212° (or above 70° in case of a vacuum caused by the condensation of steam) into a part of the molecules of water, passing into them the 966° necessary to change them from the state of water to the state of steam. That the stored heat in a boiler concentrates to form steam is shown by familiar experiments: As, for instance, causing water at less than 212° to boil by placing it in a vacuum; or by merely condensing the steam over heated water in a bottle. Again, take a steam boiler under a pressure of 100 pounds and a corresponding temperature of 340°. Remove the fire, and the formation of steam will cease. After a short time raise the safety valve, and the water will begin to boil, and generate and give off steam continuously as the pressure is reduced, until a temperature of 212° is reached, and enough steam will be thus generated and blown off to fill the boiler many times.

These tests show that the boiling point of water is lowered by simply diminishing the pressure; that sensible heat above 70° stored in the water concentrates in a part of the molecules of water, giving to them the 966° necessary to change them into steam. The water ceases to boil, no heat is applied, and by merely reducing the pressure the water again boils. The 966° above the boiling point necessary to cause ebullition are not absorbed from the fire at the instant the water begins to boil the second time. They are already stored up in the water.

Take a boiler containing 10,000 pounds of water at a pressure of 200 pounds and corresponding temperature of 389°. Suddenly reduce the pressure to 50 pounds per square inch, under which pressure water explodes at 300°. There are stored in each of the 10,000 pounds of water 89° of sensible heat above the exploding point—in the aggregate 890,000 thermal units, enough to convert 921 pounds of this superheated water into steam. In an instant these 89° of sensible heat in each pound of water are absorbed by the molecules of water at the surface and for a considerable depth, and suddenly these 921 pounds of superheated water explode into steam.

Thus it will be seen that there is sufficient destructive power stored in the boiler when thus put in action to cause an explosion. If the reduction of pressure caused by the withdrawal of steam be moderate, and such draft be continuous and uniform, there will be no danger; but if the draught is considerable in quantity and instantly checked, the nascent steam thus suddenly formed and thus suddenly checked will give an impact or striking blow upon the shell of the boiler, the aggregate force of which is equal to the weight of the water before it passed into nascent steam multiplied by the square of the velocity with which it strikes.

The instantaneous check to the exploding water acts upon the boiler with the same effect as that produced by quickly closing the valve of a water-main. In the one case it is the weight of the falling water, and in the other it is the force of exploding water, but the striking effect of the blows is the same and is measured by the same rule.

Take a boiler 48 inches in diameter, 19 feet long, and place in it 10,000 pounds of water. Then raise the temperature to 400°, and the corresponding pressure will be about 235 pounds. About $\frac{1}{200}$ part of the water, or 50 pounds, passes into steam, occupying the balance of the space of the boiler, about 86 cubic feet. The temperature is 188° above 212°. The amount of sensible heat, above 212°, stored in the remaining 9950 pounds of water is 1,870,600 thermal units, equivalent in mechanical energy to 1,444,103,200 foot-pounds. Suddenly reduce the pressure from 235 pounds to normal. At 235 pounds it required 400° to evaporate water, at normal pressure only 212°—a difference of 188°. There are stored in the boiler 1,870,600 units of sensible heat above 212°, enough to convert about 1936 pounds of the remaining water into steam, which would occupy, under 235 pounds pressure, about 3000 cubic feet of space. Rating the velocity of the nascent steam at one-half the velocity of full steam discharged into the air (1967÷2), would give a striking force of over 23,000 pounds per square inch upon the shell of the boiler.

Starting with a pressure of 25 pounds, and a corresponding temperature of only 269°, only 57° above 212°, the amount of sensible heat stored above 212° would be 567,150 thermal units. Reduce the pressure to 0, corresponding to 70°, and the 9950 pounds of water would contain 1,980,050 thermal units, sufficient to convert 2049 pounds of water into steam. Rating the weight of the water and the velocity of the nascent steam as in the last case, this would give a striking blow of over 24,000 pounds per square inch.

Take a boiler half full of water, under a pressure of 200 pounds and at 389°, and suddenly inject into the steam space a quantity of cold water. Condensation is instantaneous. Instantly the superheated water at 389° is in a vacuum where it will explode at 70°. Under these circumstances a large portion of the water will explode into steam, and, whether one-quarter, one-half, or the whole, the striking force will be sufficient to tear into shreds any boiler ever made.

If the withdrawal of steam is slight, even if followed by a sudden check, no damage ensues with boilers of the usual tensile strength; but if the withdrawal be considerable and the check instantaneous, an explosion follows. With the varying degrees of draught and sudden check come violent explosion, and mere rupture.

The distinction between rupturing and exploding is sometimes overlooked. When a boiler gives way at a weak point, resulting in damage, it is often called an explosion. When ruptured by mere pressure, the force exerted upon the shell being gradual and uniform, the weak point yields while the balance remains intact. Serious damage may result, but a uniform and unobstructed flow of steam never produces the phenomenon properly called an "explosion."

With an explosion the actual destructive force exerted is not measured by the tensile strength of the boiler nor by the regular pressure of the steam. The force is far in excess of either—five, ten, and often twenty times as great; an immense aggregate concussive and destructive force, that tears asunder the weak and the strong parts at the same instant and demolishes everything within a large radius.

Some writers on steam boiler explosions, in accounting for their violence, make the mistake of commencing the calculation at a point of time after the rupture has commenced. The fact is there is violent internal action at the instant preceding the actual rupture of the boiler, and the rupture is the result of such action. Rupture may be caused by the mere pressure of steam, but it is usually caused by an internal concussive force. It is illogical to say that boilers are ruptured or burst by mere pressure while working with a pressure of only one-fifth their actual tensile strength.

The writer's solution of a steam boiler explosion is this: The water in the boiler, under pressure, is superheated and possesses a highly expansive power. Upon a sudden removal of the pressure, without a corresponding reduction of the temperature, it starts into violent evaporation. This mass of nascent steam is checked by coming in contact with the solid and unyielding shell of the boiler. The result is that the aggregate force of this nascent steam strikes every square inch of the shell of the boiler at the same instant and with the same force, and with a power far in excess of the tensile strength of the boiler; and, moreover, this force is augmented at the instant the shell gives way by an immense reserve power caused by the further evaporation of the water in the boiler.

The writer's remedy is a simple one and consists in the construction of a boiler with a partition plate or diaphragm dividing it into two compartments, the lower containing the water and the upper containing the steam only. The steam passes from the lower to the upper compartment through numerous small perforations and a number of small valves in the diaphragm. The aggregate openings of the valves and perforations should be less than the valve through which the engine is supplied. By this means the pressure upon the surface of the superheated water is kept approximately uniform, and all sudden explosions of any dangerous quantity of water into steam and consequent striking blows are avoided.

The perforations and valves vary with boilers of different size. The aggregate area of all the perforations and valve orifices should be about 10% less than the area of the steam-port. In ordinary sized boilers there should be one perforation of $\frac{1}{4}$-inch in diameter to each horse power, rating 10 square feet of heating surface to the horse power, and such number of valve orifices of about 2 inches in diameter as to make up the balance of the aggregate area.

This lessening of the aggregate area 10% below that of the steam-port will give a very slight diminution of pressure in the engine with steam working at full stroke, but will give practically full pressure at every other point of cut-off. There must be two steam gauges used, one connected with the water space below and one with the steam space above the diaphragm. When the boiler is set and ready for use such small valves should be closed. As the steam is generated and the engine put in operation at its full capacity, any additional steam required is obtained by gradually and partially opening such valves until the required amount is liberated and ascertained, when such valves are set, and need but little further attention. In thus arranging such valves, particular attention should be paid to the steam gauges. The valves should be opened only to that extent at which the pressure upon the superheated water in the lower compartment, as shown by the gauges, remains approximately uniform with that in the upper, with the engine in full operation. Thus arranged, any unusual and sudden withdrawal of steam from the upper chamber is attended with no possible danger.

Boilers thus constructed and arranged are protected against explosions, whether the water wholly or partially fills the water compartment. If wholly filled, a sudden reaction of pressure in the steam compartment can instantly effect only the surface of the water to the extent of the aggregate area of the perforations and valve orifices, and no dangerous quantity of water can be thus exploded. As the pressure upon the water below the diaphragm is thus slightly reduced, small portions of water pass into steam and maintain uniformity of pressure.

Assay of Copper Materials for Gold and Silver.

At the Washington, February, 1900, meeting of the American Institute of Mining Engineers, L. D. Godshall read a paper on "The Assay of Copper Materials for Gold and Silver," which appeared in the issue of this paper of March 24th. In the issues of April 14th and May 12th also appeared technical reference to the same subject. In a discussion of Dr. Godshall's paper, A. R. Ledoux says:

The so-called "combination method" is generally used in assaying bar copper for silver. It has been modified from time to time. Briefly outlined as now practiced, it is as follows: One A. T. of the borings is dissolved in dilute nitric acid. When solution is complete, the liquid is boiled and then filtered to remove gold. The filtrate is treated with sufficient salt solution to precipitate all the silver, but avoiding any unnecessary excess. The liquid is allowed to stand over night and next morning the silver chloride is collected on a fresh filter, which, together with the paper containing the gold and insoluble matter, is scorified and cupelled. Formerly many assayers added sulphuric acid to the nitric acid solution of the copper and silver and then acetate of lead, thus producing a heavy precipitate of sulphate of lead, which was supposed to entangle the silver chloride and prevent it from passing through the filter. As a matter of fact, the use of sulphuric acid and lead salts is entirely unnecessary. Very few assayers now make use of them. If it is not possible to let the silver chloride settle over night, accurate results may be obtained by stirring the liquid vigorously with some form of mechanical stirrer for half an hour. The silver chloride may then be easily filtered without fear of any of it escaping through the filter. The same result may be attained by blowing air through the liquid. It is quite possible to make an accurate assay by this method in three hours. In some cases, noticeably those in which the copper is very free from impurities and the gold contents small, the correct gold assay may be obtained by parting the bead obtained by this process. In many cases, however, the gold assay obtained by the above process is too low, even though the gold be removed from the liquid by filtration before adding the salt solution. It would appear that sometimes the gold is present in the copper in some combination which is soluble in nitric acid or strong nitrate of copper solution. However, it may be, and frequently is, necessary to resort to the "all-fire method" to obtain correct results. This method consists in weighing out a number of 1 to 10 A. T. portions—usually ten—and scorifying them with lead until most of the copper is removed, then cupelling the lead buttons either separately or uniting them five and five, rescorifying and then cupelling. This method is expensive and laborious, involving many scorifications and the use of much test lead. The first scorification must be conducted at a high temperature, and the operations consume a great deal of time and muffle room. But the gold obtained is usually appreciably more than can be extracted by the combination method, though it does not seem to bear any fixed ratio to it even in the same class of copper. In general, in 96% to 98% copper, containing from one to five ounces of gold per ton, the "all-fire" results will be from 0.1 to 0.3 ounce higher than can be obtained by the combination method. Any method that would give correct gold and silver results on all classes of bar copper at one operation, and that would avoid the tedious and expensive operations of the all-fire process, would find ready acceptance among assayers. The method described by Dr. Godshall seemed to offer some possibilities in this direction. To test the practical accuracy of this method, comparative assays were made in my laboratory on three samples of bar copper, using the "combination method" for silver and the "all fire" process for gold, alongside of Dr. Godshall's method. Some preliminary experiments were made by the new method to obtain a knowledge of any peculiarities that might be developed. The process of assay was as follows: One A. T. of borings dissolved in dilute nitric acid (90 c. c. strong to 100 c. c. of water). The solution was then evaporated to expel free nitric acid, a little sulphuric acid (20 c. c.) was added, and the evaporation continued. Finally the copper salts were dissolved in hot water, the solution diluted to 800 c. c. and allowed to cool. Then sulphuretted hydrogen was passed rapidly into the liquid for two minutes. A heavy black precipitate of sulphides was produced, which settled rapidly, leaving a clear blue solution. The liquid containing the precipitate was stirred rapidly and then allowed to settle for about half an hour, and finally the sulphides were filtered off. The filtrates in most cases gave no visible reaction for silver; sometimes, however, silver was not completely precipitated by the sulphuretted hydrogen. No reason was developed why this should be the case, as those solutions which contained silver had apparently been treated exactly like those which did not. The assays noted below did not show any reaction for silver when the filtrate was tested with salt solution. The copper sulphide containing the silver and gold was dried, the papers burned in scorifiers, and the residue scorified with fifty grammes of test lead. The results were as follows:

SILVER—OUNCES PER TON.

	Godshall Method.	Combination Method.
No. 1	67.70	67.20
No. 2	57.20	58.80
No. 3	59.00	59.30

GOLD—OUNCES PER TON.

	Godshall Method.	All Fire Method.
No. 1	2.28	2.42
No. 2	1.89	2.10
No. 3	2.06	2.18

From the foregoing results one would infer that the new method can give good results on silver. But the gold assays are too low, being about the figures which would be obtained by parting the silver beads obtained by the "combination method." The new method does not seem to possess any advantage over the "combination method" in point of speed. When the silver chloride is stirred well or "blown down" with air, it can be filtered off as quickly as the sulphide precipitate. On the other hand, the new method requires the use of sulphuretted hydrogen, which is a noxious and troublesome reagent to handle on a large number of samples at the same time.

Cabell Whitehead, Washington, D. C. (communication to the secretary): Dr. Godshall has placed the metallurgical public under great obligations by reviving the subject of the determination of gold and silver in copper-bearing materials. Several years ago Dr. Ledoux brought this subject before the Institute in a valuable paper, but I have always felt that the subject was not as fully discussed at that time as might have been done with profit. It was clearly shown by the results then reported that the "combined" method yielded lower gold results than the fire assay. This was supposed to be due to a solution of some of the gold, occasioned by the impurities of the nitric acid used; and Dr. Godshall seems to have accepted that view. Since then, I have determined by experiment that when the acid is chemically pure, a partial solution of the gold takes place, probably by reason of the formation of nitrous acid during the process of solution, and that the reaction, though manifested in smaller degree, is closely allied to that which occurs when platinum, in the form of an alloy, is dissolved in nitric acid. This being admitted, it is clear that the "combined" method cannot be relied upon for gold. We were therefore greatly in need of a method such as the one proposed by Dr. Godshall. I have experimented with it, and find that, under certain conditions, excellent results are obtained. The conditions for satisfactory working are given in his paper; but I do not think the danger points are clearly marked. I found that, when the solution was cold, and practically free from nitric acid, the precious metals were perfectly thrown down with a very small amount of H_2S. In such cases, the amount of copper to be removed by scorification and cupellation was small, and gave no trouble; but when the copper solution contained much free nitric acid, or was hot, large amounts of H_2S were required to complete the precipitation; that it had to be followed by a rapid filtration; and that, even then, the solution frequently contained traces of silver. The removal of the nitric acid by evaporation with sulphuric acid is a matter of considerable difficulty, as I believe all who have tried it will admit. This and the careful attention required in making the H_2S precipitations are the chief objections to the method. I have modified it with good results as follows:

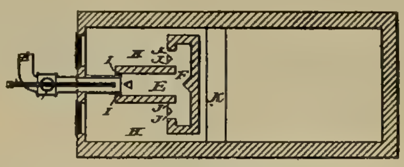
I dissolve in HNO_3; dilute and make faintly alkaline with ammonia; then make acid with acetic acid. I then add a solution of hyposulphite, sufficient to precipitate about 100 milligrammes of copper. After thoroughly mixing the solutions with a stirring rod, the beaker is boiled for five minutes, or until the Cu_2S collects. This precipitate is cupelled in the usual way. With this modification of the proposed method, I believe there remains only one objection, viz., the necessary scorification of a product high in copper. I have been working with some success to overcome this difficulty, and I hope to publish the result of my efforts hereafter.

Mining and Metallurgical Patents.

Patents Issued September 4, 1900.

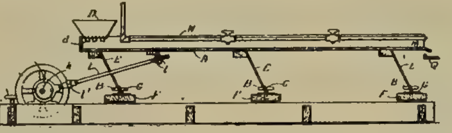
Specially Reported for the MINING AND SCIENTIFIC PRESS.

BURNING PULVERIZED AND LIQUID HYDROCARBONS FOR FUEL AND HEATING.—No. 657,228; S. M. Trapp, Tacoma, Wash.



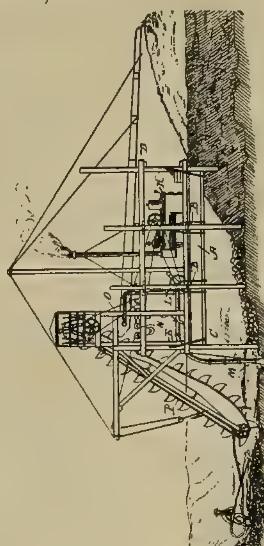
In furnace, combination with fire pit, of fuel flue leading from front toward rear of pit, rear of flue having laterally extending portions formed with ports for directing flame from flue toward front of pit, and means for drawing igniting agent from fire pit into portion of flue in advance of its laterally extending portions.

APPARATUS FOR CONCENTRATING AND SEPARATING ORES, ETC.—No. 657,393; J. Buss, London England.



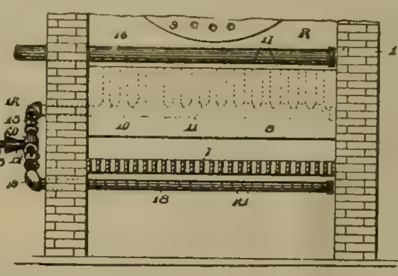
In combination, table A, resilient supports therefor arranged in pairs, independent device carrying each pair of supports vertically adjustable to tilt table transversely, support common to all of devices for vertically adjusting same to tilt table longitudinally, feed hopper at upper front corner of table and perforated pipe above table arranged parallel with and in proximity to upper side edge of table.

DREDGING APPARATUS.—No. 657,247; A. McDougall, Duluth, Minn.



Means for mining comprising, in combination, scow adapted to be used in pit or excavation, excavator thereon, for removing front wall of pit, means for supporting scow above bottom of pit, pump on scow for draining pit, connection from pump adapted to draw from reservoir, sluice adapted to connect excavator with rear wall of pit, flume or chute adapted to connect reservoir and scow, second pump on scow, flexible pipe or pipes connected to second pump by means of which entire bottom of pit may be washed, and pit flooded and drained at will.

SMOKE CONSUMING FURNACE.—No. 657,324; E. Thornton and G. S. Smith, Coitsville, Ohio.



Combination with bridge wall and combustion chamber of furnace, of perforated pipe 18 extending across ash pit beneath grate bars for feeding steam to combustion chamber, pipe 11 extending through bridge wall with series of ejectors connected thereto with outlets at top of bridge wall, pipe 11 and pipe 18 connected to common steam supply, an air supply for pipes 11 and 18, and perforated pipe 16 located above bridge wall for supplying cold air to steam and hot air emitted from injectors in bridge wall.

PROCESS OF MAKING MAGNESIA ALUMINA.—No. 657,452; M. E. Rothberg, Johnstown, Pa.

Process of manufacturing simultaneously, plaster of paris, alumina magnesia, and baryta, which consists in first mixing together solutions of alumina sulphate and lime chloride, and separating resultant lime sulphate; second, treating resultant alumina chloride solution with barium chloride, and separating resultant barium sulphate; third, adding to purified alumina chloride liquor, magnesian lime, and separating resultant magnesia alumina; fourth, recovering lime chloride solution.

PROCESS OF OBTAINING ALUMINA.—No. 657,453; M. E. Rothberg, Johnstown, Pa.

The process of manufacturing alumina, which consists in mixing lime chloride with a solution of alumina sulphate, subsequently adding lime to the alumina chloride solution produced thereby, and finally separating and heading the resultant precipitate, substantially as specified. The process of manufacturing alumina, which consists in mixing lime chloride with solution of alumina sulphate, treating resultant alumina chloride solution with barium chloride, adding lime to alumina chloride solution so treated, separating and heating resultant precipitate.

PROCESS OF REFINING COPPER FROM SOLUTIONS CONTAINING ANTIMONY AS AN IMPURITY.—No. 657,119; F. Klepetko and J. T. Morrow, Great Falls, Mont.

Process of purifying copper from solutions containing copper with some antimony as an impurity, consisting in introducing wood tea into solution, then subjecting solution to electrolysis and depositing copper in purified state.

Options.

An option is a contract by which an owner agrees with another person that he shall have the right to buy his property at a certain price and within a certain period of time.

It is not a contract for sale and grants no interest in the property.

It is binding only on the owner of the property.

The holder of the option is under no obligations to purchase.

Before a sale or a contract of sale can result the holder must avail himself of the privilege of the option, notify the option giver and comply with its conditions.

It must be in writing.

The period of time it shall run does not need to be absolutely stated.

If a consideration is present it will run a reasonable length of time, depending upon the time required to carry out its conditions.

A consideration should be present.

If no consideration is present the option giver can withdraw it at any time.

If the option is under seal a consideration is presumed.

Every extension of an option must have a consideration.

"Until" a certain day means that day included.

No action of the giver of an option is necessary to "expire" it.

Time is the essence of an option, but not as to its performance. Reasonable time will always be given to carry out its provisions.

An option without a consideration is a mere offer, and may be recalled at any time, whether the time stated has expired or not.

Specific performance will be required if the giver of an option refuses to comply with its conditions.

An option is assignable.

Specific performance will not run against third parties who have become purchasers for value in ignorance of the option.—American Investments.

Mine Bell Signals.

TO THE EDITOR:—I note an illustrated article in your issue of the 1st about the Lowell & Arizona C. M. & S. Co.'s plant at Bisbee, Arizona, in which the writer says they are using the Montana code of bell signals in the mine, which gives satisfaction. Hasn't California a code of bell signals? If so, and it is possible, I would like to have them compared. W. W. S.

Nevada City, Cal., Sept. 5.

Following are the two codes in full, as furnished officially: the best answer to the above. The California system was legalized May 1, 1893; the Montana code went into effect June 1, 1895:

CALIFORNIA CODE OF MINE BELL SIGNALS.

1 bell, to hoist. See Rule 2.

1 bell, to stop if in motion.

2 bells, to lower. See Rule 2.

3 bells, man to be hoisted; run slow. See Rule 2.

4 bells, start pump if not running, or stop pump if running.

1—3 bells, start or stop air compressor.

5 bells, send down tools. See Rule 4.

6 bells, send down timbers. See Rule 4.

7 bells, accident; move bucket or cage by verbal orders only.

1—4 bells, foreman wanted.

2—1—1 bells, done hoisting until called.

2—1—2 bells, done hoisting for the day.

2—2—2 bells, change buckets from ore to water, or vice versa.

3—2—1 bells, ready to shoot in the shaft. See Rule 3.

Engineer's signal that he is ready to hoist is to raise the bucket or cage two feet and lower it again. See Rule 3.

Levels shall be designated and inserted in notice hereinafter mentioned. See Rule 5.

For the purpose of enforcing and properly understanding the above code of signals, the following rules are hereby established:

RULE 1. In giving signals make strokes on bell at regular intervals. The bar [—] must take the same time as for one stroke of the bell, and no more. If timber, tools, the foreman, bucket or cage are wanted to stop at any level in the mine, signal, by number of strokes on the bell, the number of the level first before giving the signal for timber, tools, etc. Time between signals to be double bars [— —]. Examples:

6— —5, would mean to stop at sixth level with tools.

4— —1—1—1— —1, would mean stop at fourth level, man on, hoist.

2— —1—4, would mean stop at second level with foreman.

RULE 2. No person must get off or on the bucket or cage while the same is in motion. When men are to be hoisted, give the signal for men. Men MUST then get on the bucket or cage, THEN give the signal to hoist. Bell cord must be in reach of man on the bucket or cage at station.

RULE 3. After signal "Ready to shoot in shaft," engineer must give the signal when he is ready to hoist. Miners must then give the signal of "Men to be hoisted," then "spit fuse," get into the bucket, and give the signal to hoist.

RULE 4. All timber, tools, etc., "longer than the depth of the bucket," to be hoisted or lowered, must be securely lashed at the upper end to the cable. Miners must know they will ride up or down the shaft without catching on rocks or timbers and being thrown out.

RULE 5. The foreman will see that one printed sheet of these signals and rules for each level and one for the engine room are attached to a board not less than 12 inches wide by 36 inches long, and securely fasten the board up where signals can be easily read at the places above stated.

RULE 6. The above signals and rules must be obeyed. Any violation will be sufficient grounds for discharging the party or parties so doing. No person, company, corporation or individuals operating any mine within the State of California shall be responsible for accidents that may happen to men disobeying the above rules and signals. Said notice and rules shall be signed by the person or superintendent having charge of the mine, who shall designate the name of the corporation or owner of the mine.

Section 3 of the law says: "Any person or company failing to carry out any of the provisions of this Act shall be responsible for all damages arising to or incurred by any person working in said mine during the time of such failure."

MONTANA STATE CODE OF MINE SIGNALS.

Signal Bells.

1 bell hoist, 1 bell stop (if in motion).

2 bells lower men, 3 bells hoist men.

4 bells blasting signal, engineer must answer by raising bucket a few feet and letting it back slowly. Then 1 bell hoist men away from blast.

5 bells steam on, 6 bells steam off.

7 bells air on, 8 bells air off. 3—2—2 send down drills. 3—2 3 send down picks.

9 bells danger signal (case of fire or other danger), then ring the number of station where danger exists. No person shall ring any signal bell except the station tender, except in case of danger, or when the main shaft is being sunk. Engineers must slow up when passing stations when men are on the cage.

Station Bells.

Bells.	Pause.	Bells.	No. Station.	Bells.	Pause.	Bells.	No. Station.

Where electric bells are used in connection with other bells:

If cage is wanted ring station signal. Station tender will answer 1 bell.

Reply 1 bell to go up.

Reply 2 bells to go below.

If station is full of ore and station tender is wanted, ring station signal and do not answer back.

2—1—2 bells are rung, engineer or station tender does not understand, repeat signal.

In case of danger or accident, ring station signal, station tender will reply 1 bell, ring 9 bells.

One copy of this code should be posted on the gallows-frame and one before the engineer.

To be in effect from and after June 1, 1895.

This code is subject to change under certain conditions.

The California code is furnished by the MINING AND SCIENTIFIC PRESS, on cloth to withstand dampness, printed in heavy black letters, with blank room for the several levels. The size is 18x43 inches. The Montana code can be had on application to Mine Inspector Shoemaker, Butte, Montana.

Modern Boiler Making.

During the last twenty years the boiler shop has undergone a change, the magnitude of which is paralleled only by that in the machine shop. But while the latter has been mainly brought about by the introduction of new and improved machine tools, the former is due chiefly to the development of a new material—steel. But for this, the old methods which were applicable to wrought iron would probably not have been altered much even at the present time.

There are many points in common between the machine shop of to-day and that of twenty or thirty years ago, but there are scarcely any between the boiler shops of the two periods. Twenty or twenty-five years ago few firms were making steel boilers; to-day the construction of new iron boilers is becoming exceptional. With the new material nearly every machine used, nearly every shop method adopted, nearly every detail of the work has been altered or modified in a greater or less degree. Hand work, too, is practically extinguished in the most modern shops. Formerly there was a good deal of flanging, bending, hammering, chipping, welding, riveting, drifting and tapping done by hand, as there is still in small establishments; but good boiler work is now almost entirely a matter for machine tools, and the importance of these, therefore, has grown to an immense extent. A high-class modern boiler is now machine made almost entirely from beginning to finish. Since the errors of hand work are thus eliminated, two boilers made to the same standard are exactly alike.

Boiler making, to be carried on according to the best modern methods, requires a very large plant, so large that many a good-sized shop cannot afford it all. With only a moderate amount of machinery good work can be done, but it has to be done in a more roundabout way, with considerable increase in cost, which, as in other departments, sorely handicaps such firms in competition with the big shops.

At the present time there are four power agencies in use in boiler shops. Steam and water vastly predominate; nearly all the heavy machinery is driven by these agents. Air is chiefly used for operating small tools, such as drills and calking hammers, while electricity is employed for the same purpose, and, but moderately as yet, for driving heavy machinery tools. Steam, water and air are each suitable for riveting, though the first has been largely displaced by the last. Water power is adopted for heavy flanging, shearing and punching; steam is employed for bending rolls, drills, and most of the machine tools used for cutting purposes. Any large modern boiler shop, therefore, must needs be in possession of at least three power plants—steam, water and air—to which it may be desirable to add the electric motor. The applications of compressed air are growing at a phenomenal rate, being applicable to all the small portable tools used in boiler work. In large shops, in which numerous machines are widely scattered, any agency seems better than shafting and belting, and before long one may anticipate that the extension of the uses of air for small tools will be paralleled by that of electric driving for heavy tools, in place of belts and independent engines.

Lithographic Stone.

TO THE EDITOR:—About 20 miles northeast of here has been discovered a ledge of lithographic stone in 4-inch layers. A company will organize to work it. It is of some interest to note that Solnhofen, Bavaria, now furnishes nearly all the supply of such stone. Litho stones are found in France, near Montpelier, but are not so good as the Solnhofen stone. Lithographic stone is a compact and homogeneous limestone. The Solnhofen stones cover an area of about ten acres. The Santa Barbara deposit is 60 feet wide and has been traced 5 miles. Litho stones must be of excellent quality in order to satisfy the requirements of the art. Many stones found at Solnhofen are laid aside as not coming up to the standard. These are sold to builders and are used for paving floors. A scarcity of superior lithographic stones, if it should ever arise, would have the effect of bringing into the market inferior stones. It is interesting to note that the stones in Solnhofen do not lie deep in the ground; in fact, only the earth and some rock have to be removed, as a rule. The stones lie in layers and have simply to be taken carefully from the earth. The bulk of the ground beneath which the Solnhofen litho stones lie belongs to the public, and each homestead owner has a share in the ground. From time to time the community measures out a new stretch of ground and divides it into lots, and each gets his part. He can either explore the ground himself or sell his claim to one of the large owners. The ground itself, after it has been deprived of its costly treasure, becomes again the property of the community. Blue or gray lithographic stones are the most costly ones, as they are harder and better for use and more copies can be obtained from them. Being harder, they stand the polishing on both sides better than the yellow ones, and therefore are chiefly used for exportation to the United States. In fact, the United States takes only these double-faced stones, which can be worked by the printer from both sides. The Germans, on the other hand, are wont to use single-faced stones. Every stone does not take polish on both sides. A stone may be good on one side, while on the other it is unfit for use—has flaws, splits, etc. Such blemishes are not always apparent on the surface, but may come on when the stone is worked upon by the printer. It requires, therefore, skilled workmen who have been in the trade from their childhood to see that none but good stones leave their hands. J. S. P.

Santa Barbara, Cal., Sept. 5.

Two Kinds of Brittleness.

Two kinds of brittleness ought to be discriminated: 1. "Primary brittleness," as, for instance, that exhibited by gold when alloyed with lead, with arsenic, or with bismuth. In such cases brittleness is characteristic of the alloy from the moment of solidification. 2. "Secondary brittleness," a subsequent and more gradual phenomenon, as, for instance, that exhibited by certain varieties of German silver months or even years after solidification. "Primary brittleness" is an accident of birth; "secondary brittleness" is a disease that develops with age and circumstance. Deteriorated German silver, or platinoid, when examined under the microscope, is seen to contain crevices and fissures; the section has patches of various colors, corresponding, most probably, to separate masses of "liquated" metal. It is further suggested that by the process of "liquation" homogeneity of structure is lost; consequently the tensile strength of the material varies prom point to point of its mass; so also does the electrical conductivity. In passing afterward through the die of the wire maker, the weaker constituents give way; thus incipient crevices are formed, and through these capillary channels moisture subsequently intrudes. If such wires are used for electric currents, maximum heating occurs at the weakened sections; this accounts for the failure of German silver resistance coils on arc lights and other circuits. The separate masses of dissimilar metals constitute local circuits of very small resistance, and within these circuits internal currents act destructively upon the alloys.

Cable for Bering Sea.

On the steamer Orizaba, heading northward, is a submarine cable to connect Unalaklik, St. Michaels and Nome City. It is 187 miles long—the longest submarine cable ever to be laid by an American firm; the largest cable on the Pacific coast. Owing to the danger of the cable being affected by the cold water and ice it has been doubly armored. It is a single conductor Kerite submarine cable, has withstood 3000 volts of electricity and a pressure of 800 megonnes. The cable has a tensile strength of 5000 pounds. The main cable weighs 2800 pounds per mile; the shore ends weigh 9000 pounds to the mile. The main cable is ¾ inch diameter, the shore ends 1½ inches.

The steamer goes to Unalaklik, where the first bit of cable will be laid. The cable will then be extended to St. Michaels, 55 miles; then direct to Nome City, 132 miles. It is expected that by the time the cable is ready for use the overland line to Unalaklik will be completed.

MINING SUMMARY.

ALASKA.

Latest advices from Nome state that T. T. Lane of the Wild Goose M. Co. has made the last payment of $150,000 to Meehan, Baker, Erickson, Castillo & Long for the "Mattie bench claim."

ARIZONA.

GILA COUNTY.

The leading mines in Globe have announced an advance in miners' wages of 50 cents per day.

Silver Belt: The United Globe mine has discontinued the shipments of ore, the contract with the El Paso Smelting Works having expired and the smelting company having raised the charges for treatment $2 per ton.

GRAHAM COUNTY.

Plans for an increase in the copper production are under consideration by the Arizona Copper Co. and the Detroit Copper M. Co. of Clifton and Morenci. The Detroit Copper M. Co. by Jan. 1 will complete a narrow gauge railroad from Guthrie, on the Arizona & New Mexico line, to its mines at Morenci, which will obviate the necessity of transporting its supplies and machinery over the Arizona Copper Co.'s line to Clifton and thence by narrow gauge to Morenci.

MOJAVE COUNTY.

Miner: The Gold Road M. Co. has elected I. W. Hawkins general manager and R. J. Ferguson mining Supt.

PINAL COUNTY.

Blade: The last shipment of ore from the Silver King mine yielded 18% copper and about 800 ounces silver per ton. Pinal county mines seem to be running into copper, but at the same time retaining their other values.

YAVAPAI COUNTY.

Near Jerome the strike in the Brookshire attracts attention. Assays give 28% copper, seven ounces silver and $4 in gold to the ton.

Prospect: Supt. W. A. Clark of the Planet-Saturn, Fool's Gulch, will increase the capacity of the mill from ten to forty stamps.

YUMA COUNTY.

Ore has been struck in the Golden Eagle mine of the Harqua Hala group. C. Pickenbach is Supt.

The S. P. station is moved from Texas Hill to Mohawk Summit.

King of Arizona projects a 1000-ton plant. They now have water.

CALIFORNIA.

AMADOR COUNTY.

The Sargent mine, on the Mokelumne river, 2½ miles south of Jackson, is managed and equipped by San Francisco men.

At the Peerless mine, at Jackson, a depth of 420 feet has been reached; fifteen men are at work.

A strike is reported at the Potter mine, near Plymouth.

The Kirkwood mine, near Jackson, has a new 50 H. P. engine and hoisting works.

The 60-stamp mill of the Oneida mines, near Jackson Gate, is completed.

The Central Eureka has put in a new 200 H. P. hoist.

New hoisting machinery is being put up at the South Eureka mine.

Tangermann & Ehlers, owners of the James mine in the Clinton district, are taking out ore which assays $13.50 per ton.

At the South Spring Hill mill, near Amador City, Supt. Tregloan is operating thirty of the forty stamps.

More powerful hoisting machinery will be put in at the east shaft, Kennedy mine, Jackson.

BUTTE COUNTY.

Eastern men have secured the Campbell property, adjoining the Magalia mine, and a shaft is being sunk.

CALAVERAS COUNTY.

At the Ferry ninety men are engaged on the dam. As soon as the dam is finished mine work will be opened.

Near Milton, Williams Bros. are unwatering the shaft in the Napoleon mine—a slow process—down to the 225-foot level. The old shaft had all fallen in and had to be retimbered. The work is completed to the 300-foot. The owners expect to get at the bottom—500 feet—next month.

Mobley Bros. have suspended work in their deep shaft and are sinking a new one several hundred feet to the north on an extension of the same lead.

E. K. Stevenot has been inspecting the Oriole mine in the interest of the directors.

CONTRA COSTA COUNTY.

The Peyton Chemical Co. expects the buildings and machinery in course of construction at Peyton to be completed by Nov. 1st.

EL DORADO COUNTY.

Mining machinery is being received at Placerville; a pump engine and 500 feet T rails for the Mt. Pleasant mine, 5000 feet T rails for the Mt. Hope, Grizzly Flat, and 3000 feet T rails for the Kimble gravel mine near Placerville.

INYO COUNTY.

A tract of 16,000 acres of land, in which has been found alumina, has been located on the shores of Owens lake as placer ground.

The Owens Lake B. M. & M. Co. is incorporated. A. Baker, W. R. Smith, W. S. Bell, G W. Brown and C. E. Hockett subscribed.

One hundred and seventy-one sacks of ore shipped from the Bunker Hill mine netted $604.

Independent: The Tuba mill is running day and night.——The Ratcliff Con. Co. are working on the Harrison lease. lease.——The first carload of antimony from the Wild Rose will be shipped from Johannesburg on the 20th inst.——The Ratcliffe mine sent down to Ballarat for five men and could get but two, there being no miners in the country.——The Randsburg R. R. Co. are surveying between Johannesburg and Ballarat.——The new placer diggings at Stone Corral are attracting attention. Miners are going in from the Goler and Rademaker districts.

KERN COUNTY.

It is estimated that there are twenty-three strings of tools now operating in Sunset district, twenty-two producing wells and fifty derricks up.

County Recorder Lee has turned into the county treasury $5368.27, the amount involved in the recent litigation concerning fees for recording mining claims; the Supreme Court recently decided the case adversely to Mr. Lee.

MARIPOSA COUNTY.

The Hite's Cove M. Co. has incorporated in Mariposa with 100,000 shares, $1 each. Directors, E. L. Foster, Vallejo; H. G. Perry, Suisun; A. H. Ward, H. H. Todd, H. C. Ward, Alameda.

MONO COUNTY.

In Antelope valley, Carter, Terry, Haslam, Trumble and others have good properties that are being developed. The Almono Co. will place machinery on their property, 2 miles from Little Antelope valley.

NEVADA COUNTY.

R. J. Thomas & J. E. Poingdestre will build two Posthelwaite dredgers on Shady creek and work the banks and bed of that stream.

PLACER COUNTY.

Supt. Felix Chappellet, Jr., at the Eureka drift mine, 12 miles above Forest Hill, has the main tunnel in 3900 feet.

Herald: At the Breece & Wheeler mine at Bath work has begun at stations 5 and 28 for working the top streak over the old blue lead.——Owing to the scarcity of water, a great many claims in the mountains have been forced to suspend operations.——At the Pay Streak in Humbug Canyon a 5-stamp mill is in operation.——The Pioneer mine expects to start up during the present month with the usual force of men.——The Dorer mine is running the usual force.——At the Patrick quartz mine the stamp mill is in operation.——An electric plant for the Turkey Hill mine is being put up in El Dorado canyon.——M. R. Gleeson has ten men working at his mine near Iowa Hill.——Parties with a view of purchasing have been examining the Barton mine.——The quartz ledge in Black Canyon, owned by Snyder, Richards & Co., has been bonded to San Francisco men, who will sink on the ledge. They will use a horse-power whim for the first 100 feet.——Preparations for resuming work at the Tadpole Consolidated mine are being made.——The Canada Hill M. Co. is running its regular force.——At the Sailor Gravel mine a new tunnel is being run.——At the Glen mine a shaft is down 100 feet from the level of the tunnel.——San Francisco men are investigating the Haney Consolidated mine.——The Whitney mine at Deadwood is working steadily with a full crew.

PLUMAS COUNTY.

At 12-Mile Bar gravel mine, east branch Feather river, Supt. Gaberel has new ground opened up 1100 feet in length; twelve men are at work.

SAN BERNARDINO COUNTY.

At the placer mines near Barstow several strikes have been made. The Yucca, Long Range and Duncano mines have been turning out rich dust and the force of employes nearly doubled. E. Corner took eighteen ounces, valued at $330, out of the Yucca mine. D. Smith of Pasadena brought a sack of dust worth $900 into Barstow, which he said he and two other miners had panned out in three weeks. At the Long Range mine, which is 9 miles east of Yucca, Clark, Campbell & Sterens are making from $4 to $10 a day each.

SHASTA COUNTY.

Supt. McDermott of the Afterthought is crosscutting from the lowest level to the vein.

Free Press: The Mountain Copper Co. will not purchase the Stowell group of copper mines; it has thrown up the bond.

SIERRA COUNTY.

The Saddle Back G. M. & M. Co. has incorporated, to work the Butte Saddle mine, near Sierra City; capital stock, $500,000. The directors are P. M. Keefe, Sonora, R. N. Graves, J. Armstrong, J. C. Bunner, G. E. Arrowsmith, San Francisco.

W. Wolf, developing a quartz ledge at the Ruby mine, has reached the ledge, cleaned out and repaired 3400 feet of the old tunnel, put in a new pump and will sink on the ledge.

SONOMA COUNTY.

(Special Correspondence).—The Great Eastern Q. M. Co. has been operating continuously since 1872. Its mine is 3 miles from Guerneville, the nearest railroad town, on a branch of the California Northwestern Railroad. At present ore is being taken from the Mount Jackson, which is an extension of the Great Eastern ledge. The latter company has a lease of the Mount Jackson. The ledge has a width of 80 to 175 feet, and dips at an angle of 60°. The ore contains not more than ¾ of 1% of quicksilver. By reason of economical arrangements in handling and in reduction, as well as for fuel, this is made to pay. The plant consists of a regulation single-drum hoist, an air compressor to propel power drills in the mine, and necessary steam boilers. The furnaces are below the hoisting works. Wood is the fuel used. The shaft is 500 feet in depth (perpendicular), with an 80-foot winze. Thence a drift 400 feet in length taps the ledge. The mine produces 1200 tons of ore per year. This is a close corporation, with Alfred Abbey, one of the three owners, as Supt. The mine gives employment to sixty miners and workmen, besides fifteen woodchoppers.

A ledge of graphite is being developed on the ranch of G. R. Skinner, 4 miles south of Petaluma. The existence of this ledge has been known for several years, but not until now has there been any systematic work to ascertain its extent or value. The Sorrento Coal M. Co., H. G. Williams vice-president, is advancing the capital necessary for present operations. The shaft is down about 100 feet, where a crosscut shows a well defined 7-foot ledge.

Guerneville, Sept. 10.

TUOLUMNE COUNTY.

Assistant Manager C. Ghiglieri of the Golden West mines recently examined the new discoveries made therein, which consist of a new ore shoot about 4 feet wide, which shows free gold and sulphurets. It has been drifted on 25 feet. It dips 65° to the east. It is the superintendent's belief that the shoot is the same one developed in the upper tunnel. He has orders to put on additional men.

The Magnet reports a strike in the Riverside mine, above Columbia, which is under bond to C. H. Knox. The ore goes $65 in free gold.

Attachments aggregating $12,000 have been placed upon the Old Bonanza mine, Sonora.

The Pino Blanco quartz mine was sold at commissioner's sale last week and bought in by the plaintiff, the Union Trust Co. of San Francisco.

VENTURA COUNTY.

At Santa Paula well No. 48 of the Union Oil Co., in Torrey canyon, is down 1600 feet and is in oil sand.

The Union Oil Co.'s well No. 47 is down 700 feet. It is piped with 13½-inch casing.

COLORADO.

BOULDER COUNTY.

The Stephens 40-stamp mill, Ward district, has been sold for $13,000 to W. N. W. Blayney and the B. & M. M. Co. The purchasers will expend $7000 in repairs.

GILPIN COUNTY.

Manager Stephen Hoskin, Carr mine, Lake district, will sink the main shaft an additional 500 feet, which will give a depth of 1000 feet.

HUERFANO COUNTY.

At Ojo, 18 miles west of Walsenburg, O. S. Menlinger has been examining the copper beds and says he picked up pieces of copper glance that asayed 18%.

OURAY COUNTY.

(Special Correspondence).—The Mono & Baltic mine, near Ironton, lies on the western slope of one spur of Red mountain, and has been developed to the producing stage by Chas. Newman of Durango. The property is opened through a main tunnel, which trends eastward 600 feet, cutting through and beneath a large ore body, comprising pyritic and oxidized iron and copper ores, carrying copper, gold, silver and a small amount of lead, the iron and copper constituting a desirable fluxing material for smelters. The ore lies between porphyry and lime, and in the 1700 feet of work on the property the ore is shown to be 100 to 125 feet wide in many places. Most of the development is above the tunnel, where an incline drift follows the contact, considerable stoping having been done. Some twenty-two cars of this ore were shipped to the Durango smelter last July. The Brooklyn, also a part of this group, is well opened up, disclosing a bedding deposit of ore similar to that of the Mono.

The old Saratoga mine and mill, which ran on a large scale ten years ago, is being worked in a small way and may be expected to become a good producer again as conditions become more favorable.

Ironton, Sept. 5.

(Special Correspondence).—The American-Nettie mill is 900 feet lower elevation than the mine, being situated on the Uncompahgre river, a mile below Ouray. Ore is transported from the mine to mill over a wire rope tram line, 2000 feet long, one span from tower to mill terminal being 1800 feet in length, swinging the ore buckets 900 feet above the valley. The mill terminal is 60 feet above the vanner floor. The ore passes through a crusher, thence to the stamps, of which there are twenty, the battery product passing over amalgam plates and then to Wilfley tables. The concentrates are dried on a platform, resting upon coils of steam pipes, which connect with the boiler. The mill crushes about seventy-five tons per day and is at present operating on an old ore dump at the mine. This mill, in its main parts, was moved from Gunnison county.

Ouray, Sept. 6.

(Special Correspondence).—The Treasury tunnel, locally known as the Hammond tunnel, starts at Yankee Girl lake and takes a westerly course, almost parallel to that of the Meldrum. It has been driven about 1800 feet and will be continued till it cuts under a group of claims which the tunnel owners have under bond and lease. A company of Pennsylvania parties are principally interested.

The Bobtail, up the gulch, north of the Treasury, is being further developed. This is an old property, having a 3500-foot tunnel, which was driven in 1892. The ores are a pyritic iron, carrying some gold, and some shipments are being made.

J. H. Ryan has a lease on the National Bell dump, which contains thousands of tons of material. He is sorting out the better grade for shipment.

The Vanderbilt, Yankee Girl, Robinson and Guston are among the big properties which in former years made a great record for Red Mountain, and which are likely to be revived again. In fact, there is more work now in progress on Red mountain than has been seen for several years. With the building of matte, pyritic smelters--one at Silverton the other at Ouray—Red Mountain ought to find ready market for all the low grade iron and copper ore that can be mined. As has been noted, the Silverton smelter is almost completed and one for Ouray seems assured. Upon the success and good management of these smelters depend the revival and rapid development of mining at Red Mountain.

Red Mountain, Sept. 5.

SAN JUAN COUNTY.

(Special Correspondence).—The Gold King Con. M. Co.'s holdings now include the original Gold King group, the Sampson group, the American and Anglo-Saxon, all contiguous, mostly on Bonita mountain, sloping to Cement creek, where the company's mill is located at Gladstone. At the main workings, at an altitude of about 11,000 feet, a tunnel goes in 531 feet to a hoisting station. From this point there is about one mile of drifts and crosscuts on the Gold King and Sampson ore body, besides a great deal of stoping; and from the same station a double-compartment shaft sinks 107 feet to the second level, where there are some 1600 feet of drifting on the Davis vein and on branches therefrom. The veins, as a rule, are not far from vertical, though in some places there are vast ore bodies in nearly horizontal position. The veins, both vertical and flat, range in thickness from 15 to 40 feet, usually between well-defined walls. The small size of the dump and the small amount of waste underground show very little material between walls that is not pay ore, which is composed of an iron, copper and lead sulphide, with a considerable amount of white quartz. The values are largely gold, with some silver and lead.

A tunnel is being driven from the American mine toward the Gold King, which is designed to cut the latter vein at 600 feet below the hoisting station and 2000 feet from the entrance, the work already having proceeded 1300 feet. The present working shaft will be sunk to connect with the American tunnel.

A Bleichert wire rope tramway, 5320 feet long, carries the ore from the mine to the mill, the line carrying forty-seven buckets, each of 800 pounds capacity. One span is 2240 feet between towers, spanning the gulch between Lost and Bonita mountains.

At the Gold King mill a new tunnel has been started toward the Gold King and Sampson group, which is 7x9 feet in the clear, and is now in 600 feet. This will cut the Gold King grounds at 1800 feet below the surface and will be one mile in length. The Gold King mill runs steadily, with forty rapid-drop stamps and nineteen vanners, milling about 120 tons of ore per day. An extension to the mill has been made for forty additional stamps and twenty more tables, thus doubling the present capacity. The machinery for the new work is being put in place. About 10% of the saving is made on the plates, the balance in concentrates, there being a reduction of about five tons of ore to one ton of concentrates. The vanners are graded by speed—those taking the heavy material running at 200 revolutions, those receiving the middle size making 190 and those taking the finest or more slimy portion running at 180 revolutions per minute. Since last year a 250 H. P. Westinghouse compound, upright steam engine has been put in to operate the mill, also a new twelve-drill compressor, which will soon be brought into use in the two tunnels. The steam power is supplied by four boilers and three more are to be added. A new tramway line is being erected to connect the American tunnel workings with the mill. This company owns and operates the Silverton & Gladstone Railroad, comprising a line 9 miles long between the two points named. Besides handling the business of the company's mine and mill, the road has a growing freight and passenger business and is of great benefit to the Cement Creek district, where there is rapid development.

J. C. Purpus and Williams have a bond and lease on the Queen Anne group, on the south slope of Brown mountain, which they are developing. They also have a lease on the Red & Bonita mill, near Gladstone.

Gladstone, Aug. 30.

(Special Correspondence).—The matte smelting plant of the Kendrick & Gelder S. & M. Co. is nearing completion, and it is calculated to be in operation before the first of November. The buildings, including ore bins and assay office, are completed, the machinery is on the ground and is being put in place. There are seventeen ore bins completed for the various assortments of ores. Trackage from the Silverton & Gladstone Railroad is laid beside the ore bins. A flume, 5000 feet long, takes 20 cubic feet of water per second from Cement creek, which is delivered to an impulse water wheel at the mill, under 170 feet pressure, producing 340 H. P. This wheel will supply power to the crushers and rolls in the sampling department, to the blower for the furnace, and an electric generator for light. The furnace size is 42x120 inches, has a capacity of 200 tons per day, and will be run in connection with a Bretherton hot-air furnace, the blast being supplied by a Connellsville blower. From the furnace discharge the slag will pass automatically through the granulating laundry, thence into the waste deposit, without the use of slag cars.

The furnace charge will be so mixed as to run at least 3% copper; to contain about 3% coke and a small percentage of lime, and Supt. E. W. Walter figures on producing a 50% copper matte. The basis of the operation seems to be to oxidize the iron in the pyritic ore, thereby producing heat and producing a concentration of material of about sixteen tons to one ton. The iron, by oxidization, passes out through the slag. The work of the Bretherton hot-air furnace is to take up the waste heat which radiates through a series of pipes in the drum and return it to the furnace.

F. C. Kendrick, general Supt. of mine and smelter, states that the Henrietta mine, in Prospect basin, which belongs to the company, is developed by three tunnels, which run in on the trend of the vein 140 feet, 500 feet and 860 feet, respectively, a 160-foot upraise connecting the lower with the center tunnel, the latter being connected with the upper by an 80-foot upraise. The vein stands nearly vertical and is of good width. The ore is sulphide of copper and iron, running about 8% copper and ten ounces to twenty ounces silver. There is considerable tonnage of ore now ready for the smelter. At a point lower down the hill a tunnel site has been located and a tunnel from this point to cut 600 feet lower than present lowest workings is contemplated. The Henrietta is up Cement creek, is reached by good wagon road 2 miles from the railroad. Plans have been partially made for a 5500-foot tramway from mine to railroad.

Silverton, Aug. 31. WASCOTT.

Special Correspondence). — The Tom Moore, up Animas river and above Eureka, is being developed by tunnel drift, which is cutting under the old workings at considerable depth. It is now in 1000 feet. A 1-mile pipe line is being put in for water power.

The new Sunnyside mill started up a month ago with twenty 1000-pound, rapid-drop stamps, five Bartlett and four Wilfley tables and three canvas tables. This is a well constructed mill, operated by water power, and is situated at Eureka. It is crushing sixty tons per day of very hard quartzite, whose values are chiefly gold, which is saved largely by amalgamation. In the concentrates a product containing some lead and zinc sulphide is obtained. Mr. Terry states that twenty more stamps, with additional tables, may be added to this mill. The old mill, situated a mile or more up Eureka gulch, is operating on about thirty tons of ore per day, having fifteen stamps, with plates, the tailings passing over Bartlett and Wilfley tables. The Sunnyside mine is at the head of Eureka gulch, at 12,500 feet altitude, the ore being transported down to the mills over a Finlayson tramway line 16,000 feet long, operated in two sections—the first, 8800 feet long from the mine to the old mill, and the second 7200 feet, from the latter to the new mill.

The Scotia group, under lease to Moreland & Van Diest, is located up Picayune gulch, at 12,500 feet altitude, about 1 mile east of the Sunnyside. It comprises two lode claims and a placer location. Present development consists of one 300-foot tunnel, from which is a 200-foot drift on the main vein; and a crosscut from that 40 feet to the footwall. Two levels have also been run at higher points. The main vein is said to be 40 feet to 60 feet wide, adjacent to a porphyry footwall; a feeder vein runs at right angles to this. From these veins two grades of ore are found, the first class carrying free gold, which runs from $10 to $40 per pound of ore, the second class running from two ounces to five ounces gold per ton of ore. It is considered a remarkable showing of free gold.

Eureka, Sept. 1.

(Special Correspondence)—The Pride of the West, located up Cunningham gulch and under lease to H. M. Kennedy and others, is shipping about twenty tons per day to the concentrating mill at Howardville, which is also under lease to the same parties.

Howardville, Sept. 4.

TELLER COUNTY.

Judgment by default has been taken in the District Court against the Victor G. M. Co. on demand notes held by D. H. Moffat, aggregating $153,500 in amount. The notes were given March 23, 1900.

Cripple Creek ores won four silver medals at the Paris Exposition. The prizes were awarded for displays and were given to the Woods Investment Co., the Portland G. M. Co., Stratton's Independence Co. and Colorado College of Colorado Springs. The medal given the Woods Co. was for the best comparative display of roasted and unroasted sylvanite ores.

The Bush-Moffat tunnel will resume work.

IDAHO.

BOISE COUNTY.

World: A 6-inch vein in the Faull, Daley & Berry mine at Quartzburg is turning out ore that mills $100 a ton.——J. K. Clark has bought the Kill Buck group, owned by the Kill Buck M. Co., on a basis of $30,000 for the entire property. The group is on Lake gulch, between Wallace and Osburn.——At Wallace, the Columbia-Shamrock M. Co. has incorporated to work the Columbia-Shamrock group at the southern edge of that town.——The Standard M. Co. is putting in a new air compressor and electric plant at the mine.——Williams & Perglase will develop the Wonderful group on Stevens peak, having a working bond from the owners for $40,000.

MONTANA.

DEER LODGE COUNTY.

Inter-Mountain: In all of the Anaconda mines heavy sheet iron doors are being placed in all the connections leading to adjoining mines, so that in the event of fire they can be closed.

FERGUS COUNTY.

In the sapphire mines at Yogo the monthly clean-up averages $10,000. The gems are shipped to London, some of them selling for as high as $75 a carat. Forty men are employed.

LEWIS AND CLARKE COUNTY.

Matt W. Alderson has leased the Fargo mine, in Grizzly gulch, near Helena.

Thos. Cruse of Helena has bonded the Violet Jane mine and other properties at Mud springs, 12 miles northeast of Helena, and will prospect them with diamond drills.

MADISON COUNTY.

The Amalgamated Copper Co. has not yet closed the deal for the Clipper and Boss Tweed mines of Elling & Morris. The company secured an option for a bond that expires to-day. The conditions require that if the intending purchasers desire the mines they must make a payment of $30,000 Sept. 15. Prof. Winchell, C. F. Booth and J. Kane were examining the mine last week. It is a concentrating proposition.

NEVADA.

WHITE PINE COUNTY.

Work has been resumed on the Star mine at Cherry Creek.

ESMERALDA COUNTY.

The copper mines near Sodaville have shut down.

LANDER COUNTY.

The Eastern people who have been trying to get the property of the Nevada M. Co. at Galena have an option on it and will begin sampling the mines, for which they expect to pay $60,000.

LINCOLN COUNTY.

El Dorado Canyon reports that a majority of the stockholders from Philadelphia have appropriated $200,000 to build a new and improved mill of forty stamps, twenty concentrating tables and forty tanks for cyaniding the ore. Charles Gracey is to be general manager.

NYE COUNTY.

Boston men are reported negotiating for the purchase of mining properties near Tybo.

NEW MEXICO.

GRANT COUNTY.

The Fort Bayard M. & M. Co., owning the Texas mine at Central, has a new 100-ton mill. The Texas is a silver property.

The Golden Giant, at Pinos Altos, is pushing development work. W. S. Gage is Supt.

The Santa Rita Co. is putting on new men every day, and now has 100 men busy at development work. B. Thayer is its Supt.

RIO ARRIBA COUNTY.

Supt. J. K. Turner, Copper Hill M. Co., at Rinconado, says several months will be devoted to developing the property, and about $50,000 spent in sinking 500 feet more. Forty men are now employed. Mr. Turner had expected to sever his connection with the company on September 10, but his successor has not yet arrived.

SANTA FE COUNTY.

J. T. McLaughlin, Supt Santa Fe G. & C. Co., says he expects to have the smelter at San Pedro in operation November 1. About the mine and mill 200 men are employed.

OREGON.

BAKER COUNTY.

The Mormon Boy, Cable Cove district, is bonded to Portland men for $20,000.

JACKSON COUNTY.

Applegate reports the discovery of a quicksilver mine in Meadows precinct by Behrman & Kauffman.

JOSEPHINE COUNTY.

H. B. Nye has a small ledge of white quartz with a vein about 6 inches wide, from which about $10,000 has been taken. He has struck another pay chute which is thought to contain as much more.

LANE COUNTY.

In Bohemia district 300 claims are represented by their owners in development work; several ledges are furnishing ore to the stamp mills.

A 5-stamp mill is being hauled from Cottage Grove to the Helena. The Noonday is working twenty stamps on rich ore. The 10-stamp mill of the Musick is being overhauled. The Champion is running a 10-stamp mill; the Star five, the Tom Johnson five.

In the Black Butte quicksilver mine work has progressed further than on the Mountain King. A plant has been installed, consisting of machinery, tramways and thirty buildings. There is a working force of seventy men. In the Black Butte mine is found cinnabarette.

UNION COUNTY.

Returns from a carload shipped by the Diadem G. M. Co., near Granite, shows 3 ounces gold, 9 ounces silver to the ton.

TEXAS.

BREWSTER COUNTY.

The deposits of cinnabar in this county are located on State lands, and this fact, since the publication in the issue of July 21st, of the illustrated account of the Terlingua district, written by H. W. Turner of the U. S. Geological Survey, has caused the State Land Office to be flooded with applications to purchase these mineral lands. The rush of prospectors into the rich district still continues, and improvements in the way of furnaces for smelting the ore are in progress.

UTAH.

SUMMIT COUNTY.

Park Record: The first contract for 100 cords of rock for the Silver King sampler has been delivered.——The Alice mine has closed down.

TOOELE COUNTY.

Consolidation is the order of the day. Near Mercur the Cigale, Helvetia, Omaha and Daisy at West Dip will consolidate.

FOREIGN.

BRITISH COLUMBIA.

An agreement is arrived at between the Iron Mask and Center Star companies by which all matters in dispute between the two companies have been amicably settled, and the case will not come up again in court.

The Heinze refinery at Trail, B. C., is torn down. The structure was removed to make room for the new lead furnaces for the smelter.

MEXICO.

Near the city of Oaxaca is reported a gold discovery in the Tavichi district. "Samples of the ore run as high as $4500 gold and $1500 silver to the ton."

Two Republics: The Las Vacas mines are 60 miles southeast from the city of Durango; there are two pumping engines which work an 8-inch Cornish pump, which lifts 600 gallons of water per minute. The shaft is vertical, 485 feet deep, and from that level a second shaft is in 268 feet; the mine is worked without timbering; the chambers are supported by pillars and show no sign of caving. The average amount of ore extracted daily is sixty tons. This is crushed, concentrated in the mill, hauled to Durango and sold to the ore buying firms. From that point it is shipped to a smelter and reduced to bullion. The Cornish pump lifts enough water for crushing purposes. The San Marcas mine is within 500 yards of the Las Vacas, has no veins or leads; it is a solid block of ore. H. W. Collins is Supt.; W. J. Grace, general manager.

THE KLONDIKE.

The Dawson Board of Trade has decided to reduce the value of commercial dust in circulation in that town from $16 to $15 per ounce. The action is inspired by the adulteration of the dust with black sand. Sept. 15th is the date set for the reduced valuation to go into effect.

Books Received.

"Municipal Improvements," W. F. Goodhue. This is a manual of the methods, utility and cost of public improvement for municipal officers, a sensible, practical treatise which would be of value to any city officer honestly interested in good city government, but would be laughed at by the peanut politicians who usually run municipal affairs. Its sale might be in direct proportion to the number of city officials in the country who really want to have good sewers, streets, etc. Published by Jno. Wiley & Sons, New York City.

"List of Data Required for the Proper Designing of Railroad Bridges and Trestles," is the long name of a little pamphlet published by Waddell & Herrick, Kansas City, Mo. What it lacks in volume is made up in condensed suggestion, and any one considering such structure would find many points in the data furnished that would be of economic value. There is no advertising about it, it seeming to be a pro bono publico proposition. The firm will send a copy free anywhere upon request.

"Mechanical Drawing and Elementary Machine Design," by Jno. S. & David Reid; 8vo, 389 pp., admirably illustrated, designed to show the best modern practice in construction and design of machine detail. In addition are drafting room methods and complete instruction regarding all manner of mechanical drawing, outfit required, how to use instruments, and also appear ten separate chapters devoted to details of various devices to insure their correct portrayal. The book is a useful one to advanced students. Published by John Wiley & Sons, New York City. Price $3.00.

Catalogues Received.

THE Westinghouse Companies, Pittsburg, Pa., send strong testimonial to the value of the Improved Roney mechanical stoker. There is no description, merely a catalogue of recent prominent purchasers, aggregating several hundred thousand H. P., the owners of which throughout the United States and foreign countries recognize the merit of the Roney mechanical stoker.

THE Robert Aitchison Perforated Metal Co., 305 Dearborn street, Chicago, Ill., which supplies perforated metals of all kinds, issue a handsome little trade treatise in black and gold, illustrating the style and character of their work. They have over 600 varieties and ask our readers to send for samples.

Personal.

DANA HARMON has returned to Gaston, Cal., from San Francisco.

E. C. VOORHEES has returned from San Francisco to Amador county, Cal.

R. H. CAMPBELL of the Miocene mine, Horsefly, B. C., is in San Francisco.

WM. REED, Capitola, Cal., is examining mining properties in White Pine county, Nev.

E. C. BROWN, manager Wehe Con. Co., has returned to Loomis, Wash., from the East.

S. P. POLAND has gone from the National mine, Shasta county, Cal., to San Jose.

M. L. REQUA of San Francisco is in Kingman, Ariz., looking after his mining interests.

J. M. WILSON, manager Hearst mining properties, Guanacevi, Mexico, is in San Francisco.

L. F. SHEPPARD of Shasta county, Cal., is Supt. Chainman mine, Ely, White Pine county, Nev.

D. H. LAWRENCE on the 1st assumed the duties of smelter Supt. for the Waldo G. & C. S. Co., Waldo, Or.

H. E. O. GREEN has been appointed secretary to the Buluwayo, S. A., Chamber of Mines, at an annual salary of $5000.

HENRY PARRY, Supt. Milwaukee & Arizona P. & M. Co., is at Ray, Ariz., to start operations on the company's property.

WINCHESTER DICKERSON succeeds P. N. Moore as manager German Bar & Conroy Placer M. Co.'s property, Virginia City, Montana.

BEN STANLEY REVETT, general manager North American Gold Dredging Co., has left Breckenridge, Colo., for Siberia, for the Venture Co. of London.

W. L. WATTS of the California State Mining Bureau has an office in the Academy of Science building, San Francisco, and is preparing an elaborate monograph on the oil formations of the State.

JOS. F. CHAMPION, formerly of the Silver King mine of Arizona, has returned from Quong Si, China, where he has been superintending the erection and operation of a smelting and refining plant for a Chinese syndicate.

G. M. DAWSON, Director of the Dominion Geological Survey of Canada, after whom Dawson City was named, is inspecting mining property at Grand Forks, B. C. He will inspect various Boundary mines before proceeding west as far as Camp McKinney and Penticton.

R. U. GOODE of the U. S. Geological Survey has gone from Bingham, Utah, to Seattle, Wash. Discussing the work in the field of economic geology which is now being prosecuted by the Government, Mr. Goode tells the S. L. Tribune that it is more extensive than at any period in many years. Already the regions in what is now commonly known as Nome are under survey, the corps which has been assigned to it constituting one of the strongest that has ever been in the field. All this activity on the part of Uncle Sam encourages the belief that he will yet consent to the creation of a "bureau" of mining, if not a distinct "department," for at no time has mining been pursued by so many persons, or when so many were equipping themselves to intelligently engage in it. That such a department should exist has long been urged by those associated with the U. S. Geological Survey, but, as suggested by Mr. Goode, "about 1% of the country's multifarious recommendations never get further than the congressional committee to which they are referred, and that relating to a department of mining has experienced no different fate up to the present."

Commercial Paragraphs.

AS an instance of direct returns from advertising the Burt Mfg. Co. of Akron, Ohio, report that they are crowded with orders as the result of an illustrated notice of their Burt exhaust head, which they have only recently commenced to advertise. "Any article of merit," says Mr. Warden, manager of the company, "can be pushed successfully through judicious advertising in the trade journals, as we have demonstrated, to our own satisfaction, at least.

Recently Declared Mining Dividends.

657,376.—GAS GENERATOR—G. Woods, Bakersfield, Cal.
657,150.—GAS GENERATOR—Wonnald & Ames, Spokane, Wash.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

BOX PRINTING MACHINE.—No. 656,383. Aug. 21, 1900. John F. Ames, Portland, Or. This invention is designed to provide for the printing of the boards which are employed for making wooden boxes. These boards are not very carefully sawed and therefore vary in thickness, and it is necessary to so mount the printing rollers that they will adjust themselves to the varying thicknesses of material. The roller carrying the type of printing surface and the second roller have the ends journaled and turnable in independent and elastic bearings so that they are movable to and from each other, and one end is capable of a vortical hold independent of the other to compensate for different thicknesses of the ends of the board caused by irregularities in sawing. Means are devised for intermittently passing the boards to be printed between the rollers, and means for transmitting power to rotate the rollers in unison. By an arrangement of driving and idler pulleys and a rope or belt passing around them the automatic adjustment of the rollers is permitted without deleterious effect upon the belt.

HARNESS SUPPORT.—No. 656,405. Aug. 21, 1900. William R. Hewitt, San Francisco, Cal. This invention is designed for suspending harnesses in a spread condition as they are employed in fire, police departments and like places where it is necessary for the horses to be attached to the apparatus and in readiness to start in the shortest space of time after an alarm. These harnesses are usually spread out and suspended by ropes or equivalent attachments, but the devices by which they are thus held are not of permanent adjustment and are continually in need of repairs. In the invention is employed a series of telescoping tubes, with springs in the tubes whereby each of the set is independently spring supported. Devices are employed by which the springs may be compressed and shortened when a weight is hung from the device, and are extended and act to shorten and telescope the tube when relieved of the weight so that the tubes are carried to the upper part of the room and out of reach as soon as relieved of the harness. In conjunction with the springs may also be used pistons movable with the tubes so as to compress the air and to regulate the movement of the tubes when they are relieved of the weight of the harness so that they do not fly up too suddenly.

HYDRAULIC RIVETING APPARATUS.—No. 656,815. Aug. 28, 1900. S. Foreman, Sacramento, Cal., assignor to Schaw, Ingram, Batcher & Co., same place. This invention is designed for riveting the longitudinal seams of sections or joints socalled from which lengths of pipe are afterwards made up by riveting these sections together. It consists of a mechanism by which the overlapping edges of the plates are pressed together just previous to the heading of the rivet, a mechanism by which the section is advanced a distance equal to that between the rivet holes, means for automatically adjusting the same and means for reversing the movement of the feed apparatus so that one line of rivets is placed and headed through the length of the section and the apparatus then returns the pipe and the other line of rivets is fixed and headed. Means are provided for varying the feed and spacing to suit the difference between the rivet holes of different classes of pipe and improved construction of the riveting heads. The whole is designed to effect a perfect closure of the overlapping edges of the pipe before the rivet is headed so that leaky joints are prevented.

HYDRAULIC PLATE CLOSING AND RIVETING DEVICE.—No. 656,801. Aug. 28, 1900. J. H. Batcher, Sacramento, Cal., assignor to Schaw, Ingram, Batcher & Co., same place. This invention relates to an apparatus which is designed for riveting pipe sections together to form convenient lengths for transportation and subsequent use. It consists of a ram and its cylinder with pipes by which fluid under pressure is admitted thereto, a mandrel and a rivet head-forming tool opposed to the ram, a sleeve loosely surrounding the rivet heading tool, hydraulic pressure plungers and a head transversely connecting the upper end thereof and supporting the sleeve, and by which said sleeve is forced upwardly to form a support for the meeting pipe sections whereby the pressure of the ram first closes the sections together, and afterwards forces the support backwardly to allow the rivet to be headed. Water is brought to the ram cylinder and plate closing pressure cylinders by means of a swivel jointed pipe from an accumulator or pressure apparatus, and is distributed to the respective parts through suitable branches. The whole apparatus may be suspended or supported from a traveling carriage so that the apparatus may be moved alternately to two different parallel lines of pipe; and when one joint has been completed, the other line of pipe being in position, the apparatus can be shifted to the new line while another joint is being prepared from the first named line. Suitable carriages support and carry away the finished sections.

BALING PRESSES.—No. 656,767. Aug. 28, 1900. Charles Dodge, Davisville, Cal. This invention relates to improvements in baling presses of that class in which the follower moves in a vertically disposed box or chamber, and in which a door has its lower edge hinged near the bottom so that the top may drop outwardly to receive the charge of material, said door being closed when the press chamber is sufficiently filled and previous to raising the follower to compress the bale. The invention consists of a combination of levers operating similarly to what are known as carriage joints and connections, and by these levers the door is opened and closed. The levers are in turn connected by chains with the operating sweep which may be driven by horse or other power.

Latest Market Reports.

SAN FRANCISCO, Sept. 13, 1900.

SILVER—Per oz., Troy: London, 28⅞d (standard ounce, 925 fine); New York, bar silver, 62⅝c (1000 fine); San Francisco, 62⅝c; Mexican dollars, 50½c.

The Mexican Central Railway officials recently sold $250,000 worth of Mexican dollars at 50½ cents—the highest price obtained by the company since April, 1897, and above current quotations at that time. The sale was made in San Francisco.

COPPER.—New York: Lake, 1 to 3 casks, 17.00 cash; carload lots, 16.75; Electrolytic, 1 to 3 casks, 16.87½; carload lots, 16.62½; Casting, 1 to 3 casks, 16.87½; carload lots, 16.62½. San Francisco: 18. Mill copper plates, 20c; bars, 22@23c.

LEAD.—New York, $4.37½; Salt Lake City, $4.25; St. Louis, $4.32½; San Francisco $5.00, carload lots; 5½c 1000 to 4000 lbs.; pipe 6¾, sheet 7½, bar 6c. London, £17 15s.

In Jersey City, N. J., on the 12th at the annual meeting of the American Smelting & Refining Co. it was given out that the earnings for the first fiscal year ending April 30th are approximately $3,400,000, which is sufficient to pay more than 5% on the common after the regular 7% on the preferred. It is the intention of the company, however, not to declare a dividend on the common, but to keep the surplus for betterment. The company produced last year about $20,000,000 in gold and $30,000,000 in silver.

The new prices of the A. S. & R. Co., 50-ton lots, are as follows:

Delivered.	Desilverized.	Corroding.
St. Louis	$4 32½	$4 42½
Chicago	4 32½	4 42½
Cincinnati	4 37½	4 47½
Pittsburg	4 47½	4 52½
Philadelphia	4 42½	4 52½
New York	4 37½	4 47½
Boston	4 45	4 55

On carload lots 5c. per 100 lbs. higher.

SPELTER.—New York, $4.15; St. Louis, $4.00; San Francisco, ton lots, 5½c; 100-lb lots, 5¾c.

ANTIMONY.—New York, Cookson's, 10½c; Hallett's, 9½c; San Francisco, 1000-lb lots, 12c; 300 to 500 lbs., 13@14c; 100-lb lots, 15@18c.

IRON.—Pittsburg, Bessemer pig, $15; gray forge, $14.00; San Francisco, bar, per lb., 2.50c in small quantities.

STEEL.—Bessemer billets, Pittsburg, $17.50; sheet bars, $22.50; San Francisco, bar, 7c to 12c per lb.

TIN.—New York, pig, $31.75; San Francisco, ton lots, 33c; 1000 lbs., 33½c; 500 lbs., 34c; less, 35c; bar tin, ℔ lb, 40c.

QUICKSILVER.—New York, $51.00; large lots: London, £9 5s; San Francisco, local, $49.00 ℔ flask of 76½ lbs.; Export, $46.00.

MAGNESIUM.—New York, $3.00 ℔ lb.; San Francisco, $4.00.

ZINC.—San Francisco, 5½c; slab, 6c; bar, 7¾c.

SOLDER.—Half-and-half, 100-lb. lots, 21c; San Francisco, Plumbers', 100-lb. lots, 17¾c.

BABBITT METAL.—San Francisco, No. 1, 10c.

ASSAY LITHARGE.—San Francisco, 10c ℔ lb, small lots.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 35c.

PHOSPHORUS.—F. o. b. New York or Philadelphia, 45@50c ℔ lb.

TUNGSTEN.—New York, ℔ lb., 95c; San Francisco, $1.15.

FERRO-TUNGSTEN.—New York, 37%, 35c; San Francisco, 65c (60%).

FERRO-MANGANESE.—Pittsburg, 80%, domestic, $85, large lots.

PLATINUM.—San Francisco, crude, $17 ℔ oz.; New York, $18.25; manufactured, $19.50@22.00.

BISMUTH.—New York, ℔ lb., $1.60 50-lb lots; San Francisco, $2.50 to $2.75 lb lots.

POWDER.—F. o. b. San Francisco: No. 1. 70% nitro-glycerine, per lb., in carload lots, 15¼c; less than one ton, 17¼c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11¾c; less than one ton, 13¾c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2 per keg.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9, in lots not less than 1000.

FUSE.—Triple tape, $3.60 per 1000 feet; double tape, $3.00; single tape, $2.65; Hemp, $2.10; Cement No. 2, $3.00; Cement No. 1, $2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 12¼c ℔ set; 14 oz., 40s., 11¼c.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 32½@34½c ℔ lb.; carloads, 31@32c; in 10-lb. tins, 40c; sulphuric acid, 66% B, 2c ℔ lb.; soda ash, $1.60 ℔ 100 lbs. 58%; hyposulphite of soda, 2¾@3c ℔ lb.; blue vitriol, 5½@6c ℔ lb.; borax, concentrated, 7@8c ℔ lb.; chlorate of potash, 12@13c; roll sulphur, 6c; alum, $1.90@2.00; flour sulphur, French, 2¼@2½c; California refined, 1¾@2c; nitric acid, in carboys, 8c ℔ lb.; caustic soda, in drums, 3@4c ℔ lb.; Cal. s. soda, bbls., $1.00; sks, 95c ℔ 100 lbs.; chloride of lime, spot, $2.50@2.60; nitrate of potash, in kegs, 8c; caustic potash, 10c in 40-lb. tins.

COAL.—San Francisco, coast, yard prices: Wellington, $9; Seattle, $7.00; Coos Bay, $5.50; Southfield, $9.00. UNION IRON WORKS,

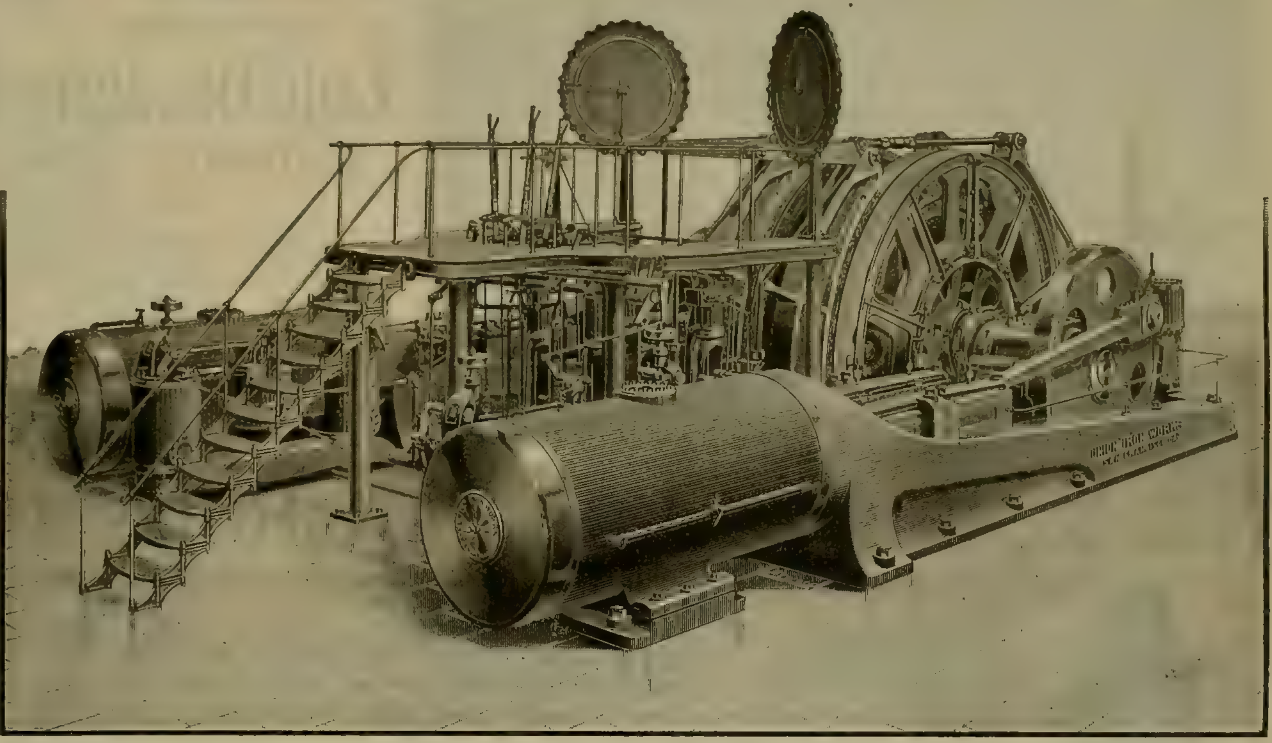
222 Market Street, San Francisco, Cal.

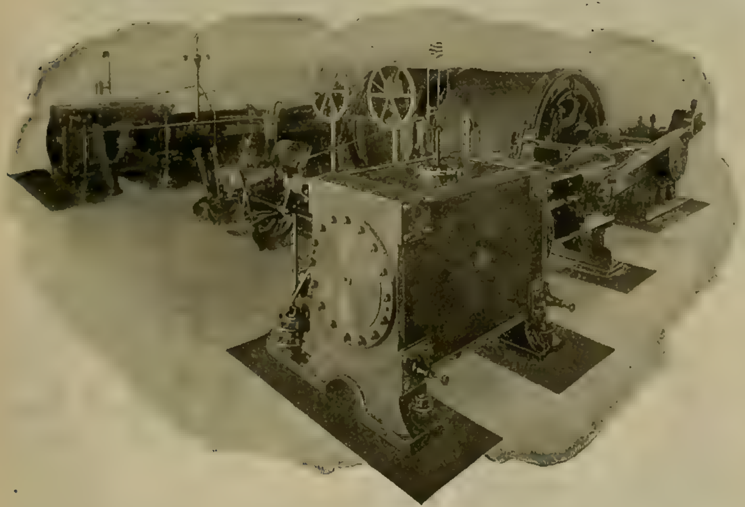
30in. x 72in. Direct Acting Hoisting Engine

BUILT FOR THE
Anaconda Copper Mining Company
OF MONTANA.

Embodying all that experience and practical working have demonstrated as valuable in this class of machinery.



The brakes, clutches and reversing gear are arranged to be operated by compressed air or steam, by means of auxiliary cylinders which are under full control of the engineer, stationed upon the elevated platform shown, insuring the most rapid work with absolute safety. Shaft hollow forged steel of ample strength and stiffness to withstand any strains; reciprocating parts of steel and are as light as consistent with the duty required; cylinders of the "overhung" type, weight being taken by a guide saddle, which admits of free longitudinal movement, due to expansion, causing no strain on bed plate or foundations; cylinders steam-jacketed, fitted with valves provided with Corliss releasing gear and hand cut-off, enabling the engines to be run economically with reference to the work to be performed; bed plates modification of the Porter Allen type, heavy and substantial, with large foundation base and anchor bolts. A duplicate of this engine has also been furnished the Homestake Mining Company of Dakota.



HIGH CLASS FIRST MOTION HOISTING ENGINES

Especially Designed

For Heavy Duty and Deep Mine Work.

Built with **CORLISS OR SLIDE VALVE ENGINES** and for either **ROUND OR FLAT ROPE.**

Our line of Hoisting Machinery is the most complete carried by any one concern in the United States. Write us of your wants.

MANUFACTURERS OF

Gold Dredging Machinery

And COMPLETE EQUIPMENT for Placer Mines
OUR SPECIALTY.

We build **GOLD DREDGES COMPLETE IN RUNNING ORDER** to handle 2500 cubic yards per day at a cost of 3 cents per cubic yard.

We excavate 50 feet below water, 20 feet above water and handle boulders up to one ton weight.

Send for Dredging Catalogue No. 17.

—WE ALSO BUILD—

All kinds of Mining, Milling, Concentrating, Pumping, Air Compressing, Hydraulic, Water Wheel and Hoisting Machinery.

EVANS HYDRAULIC GRAVEL ELEVATORS.

We publish sixteen catalogues. Write for one in the line you are interested in.

THE RISDON HAMMERED SHOES AND DIES.

Manufactured from the best quality of projectile steel—which is stronger and tougher than any heretofore used—the best shoe and die ever made. Will crush more ore per pound of steel than any other. Will not chip or cup and will outcrush any other made. Wear smooth and true with hardly any perceptible decrease in their size, and those who use them say, "We never had shoes and dies wear so long." Send for circulars and dimension blanks to

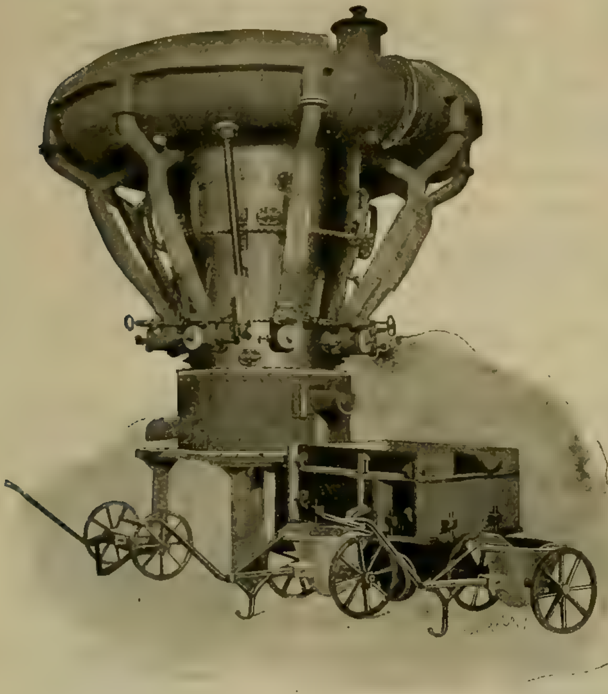
THE GRIFFIN
THREE ROLLER
ORE MILL.

The Griffin Three Roller Ore Mill is a simply constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilian Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

SEND FOR FREE ILLUSTRATED AND DESCRIPTIVE CATALOGUE TO

Bradley Pulverizer Co., Boston, Mass.



THE COPPER FURNACE

Here illustrated has OUR PATENT

WATER VAPORIZING ATTACHMENT.

Experience has proven this to be the best of all methods for applying water for the cooling of jackets. It has the further great advantage of using only about one-eighth the usual amount of water needed for that purpose, and all jackets are kept at the same temperature.

We Manufacture Smelting Furnaces and Equipments

FOR THE TREATMENT OF

GOLD, SILVER, LEAD, COPPER and NICKEL ORES.

of any desired tonnage capacity above forty tons per day, and put them into successful operation under guarantee. Write for catalogue showing different styles of furnaces.

We also design, manufacture and erect Smelter Sulphide Mills for crushing and sampling ores. We are the originators of the Narrow Face, Large Diameter, High Speed Crushing Rolls. A full description of our Crushing Machinery is given in a special catalogue, which will be sent on application.

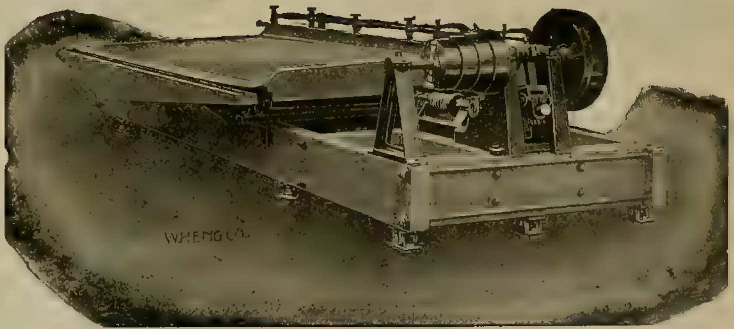
THE : CAMMETT : CONCENTRATOR.

Designed with some Regard for the Laws of Concentration.

From **The Denver Evening Post**, July 15th, 1900.

* * * "Now about concentrating tables. Here's a fellow who says there's nothing equal to the Wilfley, and I am trying to convince him that old man Woodbury over in California makes the finest table in the world." "No, sir," said his comrade, "you're way off. I've tried the CAMMETT too thoroughly to believe there's anything made to equal it."



Manufactured Under U. S. Patent No. 632,892; Dated Sept. 12, 1899.

THE IDEAL CONVEYOR BELT

Is the one that will carry stone, ore, coal, wet or dry material, holding buckets firmly and securely; will stand all kinds of exposure, and resist the heaviest strains during a long period of service. This is what the **LEVIATHAN BELT** has done, and we quote the following from a letter from the New York Steam Co.:

"We have used Leviathan Belting for four years, up to 24-inch by 8-ply, elevating and conveying coal. Some of the Belting is outside, exposed to freezing weather; some in a steam bath. In both conditions the results have been very gratifying, over 500 tons having been handled in ten hours time."

MAIN BELTING COMPANY,
1225-41 Carpenter Street, Philadelphia.

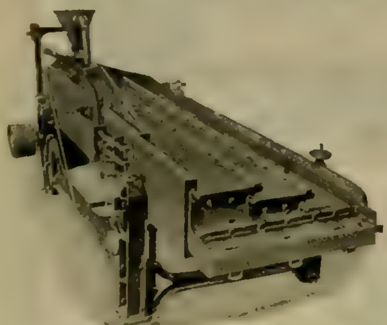
THE IMPROVED BARTLETT CONCENTRATING TABLE.



The BARTLETT CONCENTRATING TABLE has been GREATLY IMPROVED recently by the substitution of iron in place of wood wherever possible. It is now built with SOLID IRON TOP, PLANED TO A TRUE SURFACE AND POLISHED; all parts are made by template and EACH PART BEING INTERCHANGEABLE. As now constructed, the table has no special wearing parts and will last for many years. It has a CAPACITY OF FROM FIFTEEN TO FORTY-FIVE TONS IN TWENTY-FOUR HOURS, according to the class of ore worked. It is the only table in the world which will take the place of jigs and do away with all costly and complicated machinery.

It is Especially Designed for Separating Zinc from Lead.

Send for our illustrated catalogue, containing all the latest information on the concentration of ores.

ASSESSMENT NOTICES.

MARIPOSA COMMERCIAL AND MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Mariposa County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 31st day of August, 1900, an assessment (No. 18) of Ten ($10) Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 320 Sansome street, room 24, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 10th day of October, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on THURSDAY, the 8th day of November, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

JOSEPH H. MOOSER, Secretary.

Office—320 Sansome street, room 24, San Francisco, California.

SAVAGE MINING COMPANY. — Location of principal place of business, San Francisco, California; location of works, Virginia, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 13th day of August, 1900, an assessment (No. 101) of ten cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Rooms 20-22, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 18th day of September, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 8th day of October, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

JOHN W. TWIGGS, Secretary.

Office—Rooms 20-22, Nevada block, No. 309 Montgomery street, San Francisco, California.

AMERICAN OIL AND REFINERY COMPANY.—Location of principal place of business, San Francisco, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 21st day of August, 1900, an assessment of ten (10) cents per share was levied upon all the subscribed capital stock of the said corporation, payable immediately to J. C. Anthony, secretary of said corporation, at its office, at room No. 323 of the Parrott building, Nos. 825 to 855 Market street, in the City and County of San Francisco, State of California.

Any stock upon which this assessment shall remain unpaid on the 26th day of September, 1900, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on MONDAY, the 29th day of October, 1900, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

J. C. ANTHONY, Secretary.

Office—Room 323 Parrott building, Nos. 825 to 855 Market street, San Francisco, California.

ALLIANCE EXPLORATION & MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Ophir, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 3d day of August, 1900, an assessment (No. 3) of five (5) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 236 Sutter street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 11th day of September, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 2nd day of October, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

S. GOLDSMITH, Secretary.

Office—236 Sutter street, San Francisco, California.

POSTPONEMENT.

By order of the Board of Directors, the day of delinquence in the above assessment has been postponed to October 11th, 1900, and the day of sale to THURSDAY, the 1st day of November, 1900.

S. GOLDSMITH, Secretary.

Office—236 Sutter street, San Francisco, California.

EUREKA CONSOLIDATED DRIFT MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Forest Hill, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 9th day of August, 1900, an assessment (No. 26) of one (1) cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 214 Pine street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 8th day of September, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on SATURDAY, the 29th day of September, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

GEO. W. DIXON, Secretary.

Office—214 Pine street, San Francisco, California.

POSTPONEMENT.

The date of the delinquency of the foregoing assessment (No. 26) has been postponed to TUESDAY, the 18th day of September, 1900, and the day of sale from the 29th day of September, 1900, to TUESDAY, the 9th day of October, 1900.

By order of the Board of Directors.

GEO. W. DIXON, Secretary.

Office—Room 31, No. 214 Pine street, San Francisco, California.

DELINQUENT SALE NOTICE.

MAMMOTH GARFIELD GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Shasta County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the 5th day of June, 1900, the several amounts set opposite the names of the respective shareholders, as follows:

Name.	No. Cert.	No. Shares.	Amt.
Andrew Corbin	13	20.000	$3500 00

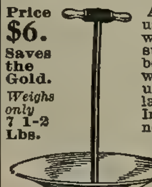
THE LITTLE ALASKA GOLD WASHER.

Price $6. Saves the Gold. *Weighs only* **7 1-2 Lbs.**



After several years' practical use in different fields, our washer has established its superiority over all placer or beach washers. It is just the washer for Cape Nome; it was used extensively in Alaska last year with every success. In working the operator does not have to wet his hands and can stand in an upright natural position. It is just the washer for the poor man who has not the money to put in expensive machinery. It will do the work of ten men with gold pans. It is just the washer for the prospector, being light and easy to pack. Don't fail to write us if in need of a washer; we can save you *time*, *labor* and *money*. RUSSELL & KINSEY, 1237 Magnolia Ave., Los Angeles, Cal.

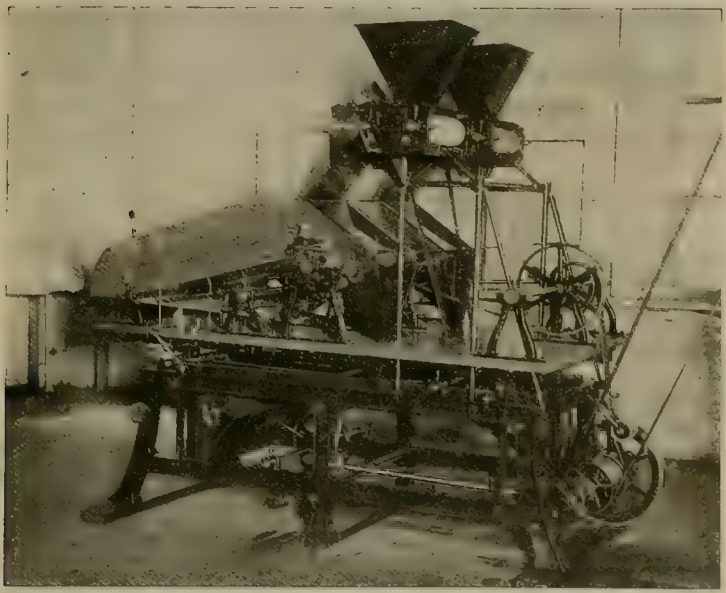
ADAM SCHILLING & SONS,
213 & 215 Main St., San Francisco, Cal.

CROWN GOLD MILLING CO.

Manufacturers of the "CROWN" CONCENTRATOR and CROWN ORE SIZER. A dry process of sizing and concentrating ore, sand or gravel. Designed to accord fully with the laws of specific gravity, and especially adapted to refractory ore or localities where there is no water.

The chief claims for the Crown Concentrator are that it occupies less floor space and has nearly four times the capacity of any wet concentrator; that it will concentrate ores containing base and refractory metals that ordinarily slime and carry off values; that it effects a saving of values far above the ordinary methods of concentration.



We have, now in operation, a complete plant for crushing, sizing and concentrating ores by the

Crown Dry Milling Process.

Mine owners desiring tests made can forward us, freight prepaid, not less than 1000 lbs. nor more than 4000 lbs. of sample, for which a charge of $20 will be made. (This amount includes assaying, etc.)

Ores for which this process is adapted and of which consignments are solicited are any concentratable ores, pulps, tailings, or sands, carrying sufficient values, whether they have heretofore been profitably concentrated or not.

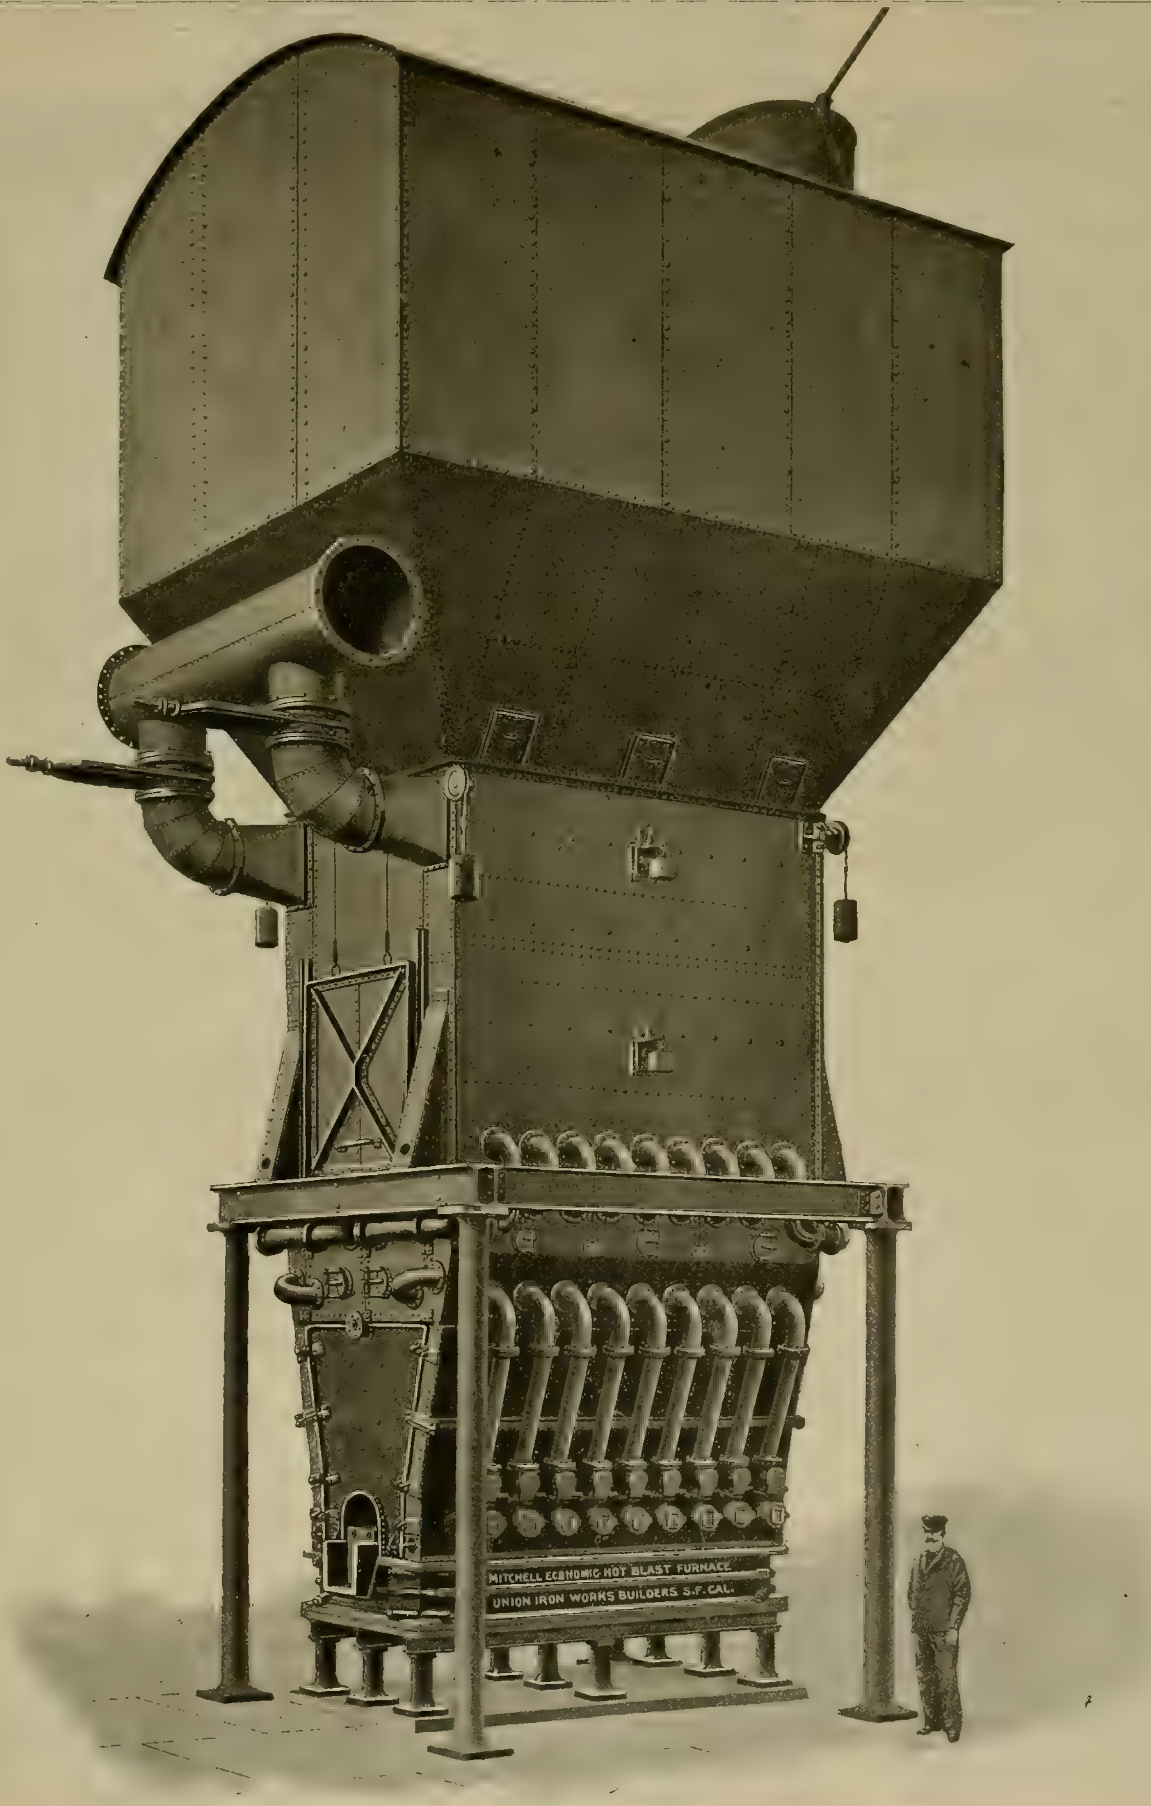
A Big Copper Furnace.

At no period in the history of the world has the demand for copper been so great as at the present time, and the appliances for its reduction are being steadily improved. On this page appears an illustration of the Mitchell economic hot blast water jacket furnace, recently built by the Union Iron Works for the Copper Queen Consolidated Min-Company of Arizona. This structure, standing 50 feet in height, is foremost among the largest and most improved furnaces ever built, having a capacity of 300 tons per day. The main feature of this furnace consists in its adaptability for reducing, at one operation, raw copper sulphide ores to a matte suitable for bessemerizing, without preliminary roasting. The blast is first introduced into air jackets located above the smelting zone, and is heated to a temperature varying from 500° to 900° F., and is then introduced into the furnace through tuyeres as shown. The condensing chamber, located on top of the air jackets, collects most of the fine dust, which is run out through suitable openings, bricked and returned with the charge to the furnace. The makers say that this furnace, by means of the hot blast and special features introduced, affords the nearest approach to pyritic smelting that has been performed with success, the fuel used being about 3% of the charge, which marks an advance in the economy of smelting.



MITCHELL ECONOMIC HOT BLAST FURNACE
UNION IRON WORKS BUILDERS S.F. CAL.

HOT BLAST WATER JACKET FURNACE.

The inventor of this furnace, Mr. George Mitchell, is a progressive metallurgist, having given a life study to the smelting and refining of copper.

The works referred to are now building furnaces of this type, of 200 tons daily capacity, for the Greene Consolidated Copper Company and also the Copete Copper Company, together with all accessories constituting complete plants.

◆

The Leadville, Colorado, Mining Stock Brokers' Association has decided to appoint a "rustling" committee whose duty it shall be "to interview the business men with the view of inducing them to subscribe money to be invested in mining stocks" under the direction of another committee which the brokers will appoint, the object of the scheme being to "strengthen the stock market." It is to be explained to the business men that the brokers' committee could spend the money, if the business men would put it up, in buying such stocks as were sure to advance and at the same time "strengthen the market."

IF eight persons should make eight distinct and separate placer locations of twenty acres each, and seven of the locators should convey their claims to the other, it would require annual assessment work of the value of $800 to maintain the possessory right to all of the claims; but in the case of a single location, embracing 160 acres of placer mining land, the owner thoreof, in order to maintain his possessory right thereto, would not be required to expend $100 worth of mining labor on each twenty acres thereof, but his possessory right to the entire 160 acres might be maintained by performing thereon $100 worth of actual mining work, designed in good faith for the improvement of the 160-acre location as a single mining claim.

To PROF. S. B. CHRISTY, Dean of the College of Mining, University of California, this paper is indebted for opportunity to publish the valuable data on the comparative value of coal and crude petroleum as fuel, which appear in the issues of last Saturday and to-day. The experiments, of which the published article is the condensed result, cost nearly $1000 and months of skilled effort. The article supplies the latest published data of the kind. Since the early part of 1898 this paper has published a number of technical articles on the subject of petroleum in California, and it is probably not too much to say that the articles so published throughout 1898, 1899 and 1900 formed the basis for the present successful development of California's oil wealth.

IN depth from surface and magnitude of operations Michigan is pre-eminent in American metal mining. The Lake Superior region first produced copper in 1845, the product that year being 26,880 pounds, worth $6000. Over half a century of mining and scientific progress resulted last year in giving employment to 13,051 men in the mines of Houghton county, the product being 146,950,338 pounds, worth $28,098,382. The total production of the Lake Superior copper mines to the close of 1899 was 2,521,378,296 pounds refined copper, valued at $389,588,204. In the last ten years the product and the number of mine workers have nearly doubled. In 1890 there were 7310 men employed in the mines of Houghton county. It is estimated by the mine inspector that 14,000 men now find employment therein. The Hecla paid its first dividend of $5 per share in December, 1869; the Calumet its first in August, 1870. In thirty years the Calumet & Hecla has paid over $70,000,000 in dividends.

Strike of Coal Miners.

The threatened strike in the Pennsylvania anthracite coal mines has come to pass and 100,000 coal miners are idle. The same conditions that caused strikes there before occasion the present disagreement, with probably the same result. J. Fahey, president district No. 9, sends from Hazleton, Pa., a statement in which he says:

> The causes that have led the miners to make their present demands have been stated generally, but not in detail. Briefly, they are the manner in which the men are overcharged for the necessaries of life at the company stores, for their tools and powder, and the exorbitant rent they are compelled to pay for company houses; the fact that at the present time the ton of coal gotten out by a miner usually weighs about 3500 pounds, and even with this great surplus the fact that he is docked for slate and dirt; the fact that there is no uniformity of pay, and a score of things that need not be spoken of here. The changes that we ask for are few and all are not so great that they might not be made. In regard to the stores, food costs from 15% to 20% more than it should. An ordinary celluloid collar button, the brand that sells for 5 cents a dozen in a store, is sold by the company for 5 cents each. From a collar button to a keg of powder is about everything a miner needs. The DuPont powder works manufacture this powder and sell it at 90 cents a keg. The companies charge the miners $2.50 for this same powder. In the soft coal mines and in other mines this powder is sold to miners at $1.50 a keg, which gives the company a profit of about half a dollar. The anthracite operators demand a profit of $1.50 on every keg. They demand the same amount of profit on all tools. We demand that the price of powder be reduced to at least $1.50 a keg. We ask that the other necessities of life be reduced equally. We seek lower rent. We also ask that hereafter the coal mined shall be weighed and that a ton shall be the same number of pounds as that sold by the operators. We ask that the pay be uniform throughout the region. In some mines the workmen get $1.25 a day for work that men get only $1 for in other mines. This condition creates discontent. We seek to have the same amount paid for the same class of work in all mines. The miner earns on an average about $1 a day, and the extra cost of his food and other necessities means a lot to him.

The employers and operators claim that the strike is incited mainly for political effect, the same as the Homestead strike in July, 1892, which many think determined the result of the presidential election the following November. Such a strike as the present one always entails great loss, even though the strike be short-lived, as strikes among coal miners usually are. The chief element to be feared is the uncontrollable Hungarian and Pole contingent that so quickly resorts to violence, riot and destruction of property, of course resulting in calling out the militia with the usual unfortunate termination.

Like every other class of workers, coal miners undoubtedly have their grievances, but, probably, the operators and owners have their own troubles. If at all practicable, it would seem better to have a conference of employers and employes. Considerable of the ill will and consequent disaster arises from lack of knowledge of conditions, each side viewing matters solely from its own point of view. The complaints voiced above from the strikers' representative manifestly demand fair hearing and an attempt at adjustment, and probably a sincere and well-meant effort to secure mutual justice would avert the present trouble, with its inevitable disastrous conclusion; but if, as the employers claim, the order to strike was sent out almost simultaneously with such demand for adjustment, that would give color to their assertion that the whole thing is mainly and primarily intended to influence votes next November—an assertion that does not admit of present proof. The mine owners allege that the interests of the bituminous coal operators favor the strike as a matter of business competition.

The right of organized labor to strike is a natural one, and in the State of Pennsylvania is made legal by statute; and so long as the men are within their rights, they naturally have strong claims upon public sympathy. Such sympathy is, however, immediately forfeited by injury on the part of the strikers to persons or property, and in this respect the worst enemy to the success of a strike is the lawless element, whose violence constantly menaces the effort to secure justice from employers.

REGISTERS AND RECEIVERS of land offices are in receipt of orders from Washington, D. C., instructing them to keep their offices open to the public for business from 9 A. M. to 4 P. M. each day, except Sundays and holidays. The important part of the order is as follows: "No original business should be transacted before 9 o'clock A. M. nor after 4 o'clock P. M." It has been the custom in some localities to attempt to use the Land Office in getting "snap judgment" in filing entries, applications or adverses at hours others than those officially designated, and with the official order in plain view the local land officials can now decline to transact business at any other time than that officially prescribed.

Of General Application.

At a recent banquet to prominent visitors given by mining men at Rossland, B. C., in the course of several speeches many good things were said, among the best being the following in the course of some remarks by E. B. Kirby, manager War Eagle and Center Star mines:

> In the progress of civilization no factor has ever been known to exercise such a powerful influence as mineral wealth in attracting energy and capital to a country. * * * * Mining men realize that apart from their selfish interest in the question, it is always a matter of the wisest policy to do everything possible to encourage mining. Nature places enough obstacles in the way, and it is surely the part of wise government to remove them so far as possible, and to encourage and aid in every way those who are devoting their lives and fortunes to the work of developing these resources. The interdependence of all citizens in the mining districts is so great that they stand or fall together according to the success or failure of the work. It is the experience of the oldest mining regions that every burden or restriction imposed upon the mines invariably affects every one in the community. For all these reasons mining men everywhere feel that they are justified in asking, in the name of public welfare, for special considerations.

Mining is the basic industry of a nation. On it rests as on an underlying foundation the prosperity of a country, and when the industry is hampered, and that which is necessarily difficult is made more so by indifference or hostility, the result is injurious to all.

A DENVER, COLO., daily asserts that T. F. Walsh will receive several million dollars for his Camp Bird mine at Ouray, Colo., from a syndicate of English and American investors headed by A. Beit of South Africa and J. P. Morgan of New York. The further assertion is made that a draft covering the first payment is now on deposit in a Denver bank, that a mining expert is now at Ouray to make a final examination of the mine on behalf of the syndicate, and it is expected in Denver that the deal would be closed by Oct. 1st. There has been considerable attention of late given the rumored sale of the Camp Bird property. About the 1st inst. a MINING AND SCIENTIFIC PRESS staff correspondent was detailed to visit the mine. The result of his visit is published on page 347, being devoted largely to mill practice.

THE apex law, with its extralateral rights and all the ills of litigation that follow in its train, is a legacy of the old Spanish rule. It was a Spanish institution adopted when California was added to the United States and perpetuated in our mining statutes. All Spanish speaking countries discarded it on attaining their independence, Bolivia alone excepted. In the United States and Bolivia that ancient ruling is still the supreme law, in defiance of the great principle of common law observed by all the rest of the world.

THE U. S. transport Lawton is bringing back stranded and penniless men from Cape Nome, lured there by fairy tales told by transportation companies and repeated by a venal press. The only punishment to those who occasioned so much suffering and loss must be the consciousness of their own identity. It is fortunate for their dupes that the Government took pity on them.

THE payment of the current $20 dividend of the Calumet & Hecla Mining Co. makes an aggregate of dividends declared by the directors of that company of $70,850,000, being a larger amount than has ever been paid in an equal space of time to the stockholders of any gold or silver mine, and is exceeded only by the amount of dividends paid by the Con. Cal. & Va. of the Comstock, Nevada.

Concentrates.

THERE is no bullion tax in Arizona.

A CUBIC FOOT of lead ore weighs 674 pounds.

THE annual consumption of "blue vitriol" on the Pacific coast is about 1200 tons.

PROBABLY $3 per ton would be a fair minimum estimate of cost to give on barrel chlorination.

CALIFORNIA'S average yearly output of gold for the past fifty years has been about $26,000,000.

AN illustrated article on cheap ventilation in small mines appeared in the issue of March 18, 1899.

THE Chicago Pumice Co. buys pumice; the finished product sells in Chicago for about $25 per ton.

IT is not considered that quartzite was deposited as molten rock, it being a hardened crystallized sandstone.

TO SOFTEN iron and steel, cover it over with a coating of tallow; heat in a charcoal fire and then let it cool.

AN ounce of pure gold—1000 fine—is worth exactly $20.671834625; a grain of gold 1000 fine is worth $0.0430663.

GARMENTS made of textile fabrics, if dipped in a 25% solution of phosphate of ammonia, are rendered uninflammable.

THE entire subject of "fatigue" and breakage of stamp stems was scientifically considered in the issue of Jan. 7, 1899.

ABSOLUTE ZERO is understood to mean a temperature so low that there would be no heat present. It is indicated at 460°.

SIX POUNDS bicarbonate soda, 4 pounds litharge and 2½ pounds powdered borax ought to make a good flux for the ore described.

TO FILL holes in castings, take lead nine parts, antimony two parts, bismuth one part; melt and pour in enough to fill the holes.

ELECTRICITY was first used in mining in Colorado in 1889; first used in mining in California at the Big Bend mine, Feather river, in 1888.

A MILLSITE may be patented by compliance with the same requirements regarding survey and notice as are applicable to mines or lodes.

SINKING was discontinued on the Comstock, Nevada, March 28, 1882. The combination shaft of the C. & C. had then reached a vertical depth of 3250 feet.

WAVE MOTORS are interesting toys, but the present state of the art is not encouraging to those desirous of viewing it from the standpoint of commercial profit.

ORDINARY AMALGAM from a hydraulic sluice box will run about 65% quicksilver and 35% gold. In retorting there would be an average loss of 10% of the quicksilver.

ASBESTOS and carbonate of magnesia are among the best substances to cover a pipe or steam heated surface for protection or prevention of heat radiation or conductivity.

NO ONE other than the original locator can legally locate a lode claim in the bounds of a properly located placer claim unless there has been abandonment by the placer claimants.

THE late Adolph Sutro got his tunnel franchise from the Nevada Legislature in 1865, and, subsequently, congressional authorization. The tunnel was begun in 1869 and finished in 1879.

"THE first gold mine in the United States" is believed to have been the Barringer, in Stanley Co., North Carolina—a placer claim that later was developed into a paying quartz lode mine.

CONTINUED USE of cyanide of potassium for removing the green copper oxide sometimes found on copper amalgam plates will ultimately make them too hard for the mercury to sufficiently adhere.

AN ounce of standard gold in London, i. e., gold of 916.6 one-thousandths fine, is worth £3 17s 9½d. An ounce of fine gold in London, i. e., of 1000 fine, is worth £4 4s 10d. An ounce of fine gold in New York is worth $20.67, or £4 4s 10d.

ONE can always concisely explain what he thoroughly understands, and in any event his explanation of it is usually in proportion to his knowledge of the subject. Indistinctness of expression is inevitable where there is obscurity of thought.

IF one wants to write a good book on mining and milling gold ore, a bunch of catalogues issued by mining machinery manufacturers and a file of this paper would fill all requirements except the mechanical work of compilation and writing a preface.

A RUST JOINT that will stand heat and cold and rough usage is made as follows: Mix ten parts of iron filings and three parts of chloride of lime with water to a paste. In twelve hours it will set so that the iron will break sooner than the cement.

A DRAWBACK of the duties paid on imported lead refined in a bonded establishment and subsequently withdrawn on payment of duties for domestic consumption, is allowed upon the exportation of the articles manufactured wholly from such lead.

FOSSILIZED cedar tree trunks 3 feet in diameter have been found in California drift mines at points over which were 700 feet of lava, a few inches of the outside changed to lignite, the remainder perfect in the grain and retaining the pungent odor of the wood.

THERE is no "prospecting" east of the Missouri river for two reasons—1st, there isn't much to "prospect" for, and, 2nd, as there are no public lands, even if there were anything to prospect for, the prospector would have to get permission from the owner of the ground.

FOR a loose rubble wall the height should never exceed 10 feet, and the base width should be at least one-half the height. To get a well-proportioned wall of this material the base can be three-fourths the height, with a face having a half to one slope and a back with a one to one slope.

THERE are mines in Pitkin, Park and San Juan counties, Colorado, almost 14,000 feet above the level of the sea, in limestone in connection with porphyry. There are mines in California the lower workings of which are nearly 1000 feet below the level of the sea, in slate, quartz and granite.

STONE for building should not absorb more than 5% of water in twenty-four hours. It needs to be insoluble. A simple test for insolubility is to put some of the crushed stone in a glass of water, let it alone for an hour, then stir. The cloudier the water becomes the more soluble material there is in the stone.

TO TEMPORARILY stop small leaks in seams of boilers or pipes, mix equal parts of air-slaked lime and fine sand with finely powdered litharge, in parts equal to both the lime and sand. Keep powder dry in a bottle or covered box. When wanted, mix as much as needed to a paste with boiled linseed oil and apply quickly, as it soon hardens.

SULPHIDE of mercury may be found at Sulphur Bank, Colusa Co., Cal., where also may be seen in decomposed volcanic rocks fissures from which issue steam and hot alkaline water, the sulphur springs depositing siliceous sinter which contains cinnabar and sometimes gold, as do Steamboat Springs, Nevada, where can be seen ore deposits in process of formation.

IN the progress of practical mining our readers can greatly aid by sending accounts of mining or metallurgical work, notices of what is done in the mine that is deemed of sufficient value to merit publication, thus adding to the stock of common knowledge. Where possible the matter would be of added value if accompanied by photographs or sketches for suitable illustration.

IF the quicksilver flours in an arrastra grease may have got into the basin, or the pulp may be too thick; arsenic and black oxide of zinc tend to sicken quicksilver. If it be so finely floured that the minute particles will not unite, it can be collected by patient addition of a little sodium. Where black oxide of manganese can be shown to be the cause of flouring, a little quicksilver added to the charge will help.

AN explosive intermediate in power between nitroglycerine and ordinary blasting powder consists of a mixture of the nitrates of sodium and potassium with sulphur, bichromate of potassium and coal tar. The latter constituent renders the explosive impervious to damp and holds the whole together. The proportions used are: Sodium nitrate, 69 parts; potassium nitrate, 5 parts; sulphur, 10 parts; potassium bichromate, 1 part; coal tar, 15 parts. After mixing the powder is compressed between warm plates. Taking ordinary powder as 1, the power of this explosive is 4.9 to 7, nitro-glycerine being represented as 9.

THE introduction of electric motor driving on machinery has led to such modifications in the design of machinery as would naturally follow from the differences between belting and motors. For example, since the motor is small and can be built into the machine close to the cutting tool, or the part which uses the power, all shafts, gearing, wheels, etc., within the tool, which have been heretofore necessary to receive the driving belt and transmit its power to the tool, may be dispensed with, and then the frame of the machine may be made a different shape, or much lighter, since it does not have these additional parts to support.

IT is not unusual for a man with a mining claim for lease or sale to endeavor to get it in some line connecting it with a well-known producer, on the theory that the trend of the ore body is in that particular direction. Nature never laid down these ore channels with such mathematical exactitude. If anything, the ore shoots follow the lines of least resistance, and these may be very irregular. While it may be an aid in inducing capital to invest in some enterprise to show a colored map with red lines all leading to a famous producer, yet ore bodies can and will be opened up without reference to any such arbitrarily drawn lines.

AIR in its passage through pipes is subject to friction in the same manner as water or any other liquid. The pressure at the compressor must be greater than at the point of consumption in order to overcome the resistance of the pipe. The power which is needed to produce the extra pressure, representing the resistance of the pipe, is lost, as there can be no useful return for it. The losses by friction may be serious if the piping system be poorly designed, and on the other hand extravagant expenditure in pipe may result from a timid overrating of the evils of friction. The difference in pressure between the entrance to the pipe and the point of use is, in hydraulic engineering, termed the loss of head, and the power lost—in hydraulics—is directly in the ratio which this loss of head bears to the entire head. The same line of figuring is sometimes applied to pneumatics. Friction of air in a properly designed pipe system is not a serious matter, and can be made as small as the most exacting requirements may demand. To reduce pipe friction the pipes must be enlarged, and, as this means additional expense, it is advisable to have a careful plotting made of the entire plant to see what may be true economy.

FOR the first seven months of 1899 New York city imported $8,456,053 gold; for the first seven months of 1900 New York city imported $1,884,761 gold; for the first seven months of 1899 New York city imported $10,299,464 silver; for the first seven months of 1900 New York city imported $10,369,783 silver. For the first seven months of 1899 New York city exported $25,778,035 gold; for the first seven months of 1900 New York city exported $29,657,620 gold. For the corresponding periods San Francisco imported respectively $10,828,228, $9,049,679 gold; $1,546,894, $1,725,025 silver; and exported $2,808,249, $4,646,680 silver. These figures are furnished by the Sub-Treasurers of the two cities.

THE laws governing the flow of air in pipes are somewhat complex. For any given velocity the loss in head due to friction, if stated as a per cent of the total head, will not be affected by the pressure; but, as usually stated, in pounds on a gauge, it becomes greater for the same velocity in the pipe, as the pressure becomes greater. The velocity varies approximately as the square root of the loss of pressure. The loss is not directly as the length, except for short distances and low velocities. As a pipe is extended, the velocity of the flow of air in the distant end of pipe becomes greater, by reason of the increase in the volume of air at that point. This increased velocity causes a greater loss of head for each length of the distant pipe.

THE durability of building stones is indicated by their chemical composition, both in the crystalline and the non-crystalline, or sedimentary groups. The nature of both the grains and the cementing material is also to be considered. The latter may be such as to be really acted upon by atmospheric elements, and the stone fall to pieces as a heap of quartzose sand. each grain of which, by itself, would have resisted for ages. Without the bond the tottering wall gives way. The principal atmospheric agents which attack stones are carbonic, hydrochloric, nitric and sulphuric acids, ammonia, and several organic acids. These agents, carried by rainwater, act by solution, oxidation, deoxidation and hydration and the constituent minerals, as well as the cement, are affected by them. The durability of any given stone is determined by that chemical constitution which is least liable to change under their action.

FLAT ROPES are composed of a number of wire ropes called "flat rope strands," of alternate right and left lay, placed side by side, secured or sewed together with soft Swedish iron or steel wire, forming a completed rope. The sewing or filling wires, being softer than the steel wires comprising the strands of the rope, act as a cushion or soft bed for the strands, and wear out faster than the harder wires composing the latter. When the sewing wires are worn out the flat rope can be resewed with new wire, and if any of the rope strands are also worn or damaged these can be replaced with new portions. Flat ropes are used principally for hoisting purposes. When large and long ropes are used in hoisting heavy loads out of deep shafts round ropes require large and heavy drums on which to wind; flat ropes, winding on themselves, need a reel very little wider than the width of the rope. Flat ropes do not spin or twist in the shaft.

OSMIUM is one of the rare metals, the densest of all metals and the most refractory, being infusible at any except the highest attainable temperatures. It is found native as an alloy in certain ores of platinum and iridium. It is a hard, bluish-gray metal, with an atomic weight of 191.1 and specific gravity 22.477—the heaviest substance known. Its tetroxide has a strong odor of chlorine, from which circumstance its name was originally derived. It is suggested as the material of a new electrical filament because of its practical infusibility—its known resistance to temperatures in which platinum and iridium volatilize and disappear. The intensity of light emitted by an incandescent substance increases rapidly with its absolute temperature. By heating osmium in a vacuum with an electrical current strong enough to volatilize platinum, it attains a luminosity hitherto almost unknown, emitting a white light of agreeable quality and color, but of great intensity.

A DRILL SHARPENER says: "The most important thing in tempering drills is to heat just the edge of the drill as short as it is possible to do; for this reason: suppose you heated it back, say, 2 inches from the end, and tempered it in that way, the chances are at the first or second blow the drill is struck off flies a piece of the face of the drill—sometimes 1 inch and at other times ¾-inch. Then this has to be all cut up before you can go on. I had this occur to me once when I was engaged at drill sharpening. I worked at it for eighteen months, and in the first week I had a piece drop off of the end about 1 inch. That gave me a sufficient lesson never to let it occur again. Now, if you want to make a drill larger or smaller than it was before, you have then to heat it just as long as you want, and, as soon as made ready for tempering, put it down to cool off, and when cold take it and temper as I describe above. When a drill is put into water it wants to remain until completely cooled off, because if you take it out not completely cooled it is liable to fly off."

California Crude Petroleum as a Fuel.

NUMBER II.—CONCLUDED.

By ERNEST H. DENICKE, College of Mining, University of California.

While coal was being used very careful working tests were made continuously, one boiler being set aside for this purpose. The amount of water entering the boiler was measured by a meter on the feed pipe and the amount of coal burned was weighed. Besides this, chemical analyses were made of every kind of coal used. The following table gives some of these:

ANALYSES OF COAL USED AT THE WESTERN SUGAR REFINERY, SAN FRANCISCO.

COAL.	Water	Ash	Volatile	Fixed Carbon	Heating Power.	Evaporation at and from 212° F.

*NOTE.—In justice to the Corral Hollow coal, it should be stated that the coal first mined was from the surface and was a quality inferior to that now put on the market. A boiler test with Corral Hollow coal made by W. R. Eckart gave an evaporation from and at 212° F. of 7.192 pounds.—S. B. CHRISTY.

The Western Sugar Refinery has exceptional opportunity for getting cheap coal, and handling it cheaply. It has its own wharf and bunkers, and from the bunkers the coal drops to the fireroom by gravity. The coal was always bought by the shipload and thus very low rates were obtained. The price of coal varies greatly from time to time and, especially within the last few years, the prices have been high. The following table may be of some interest, as it shows the fluctuations and steady increase of price, and also gives some idea of the amount of coal burned and the shipping necessary to supply this coal:

EVAPORATIVE TEST OF COALINGA OIL.

Duration of test	22 hours.
Pounds of oil burned	5,233
Pounds of water evaporated	61,208
Temperature of water	67° Fahr.
Steam pressure above atmosphere	90 pounds.
Actual water evaporated per pound of oil	11.69 pounds.
Equivalent evaporation from and at 212°	13 9 pounds.

It was originally intended to run this test four days continuously, but in consequence of poor combustion, due to defective arrangement of boilers, it was decided to stop at the end of twenty-two hours to make alterations.

This was the first test made of Coalinga oil at the Western Sugar Refinery and was made under unfavorable conditions, but on the strength of this test the whole method of heating was changed.

STATEMENT OF COAL BURNED IN 1897, SHOWING AVERAGE EVAPORATIVE EFFICIENCY FROM AND AT 212° FAHR. EFFICIENCY FIGURES FROM TESTS UNDER BOILER NO. 22.

Coal.	Tons.	Evaporation from and at 212°.
Co-operative	8,986	8.88
Duckenfield	2,957	7.37
Nanaimo	9,850	7.29
Wallawah	676	7.70
Greta	9,207	7.56
Teaham	2,591	8.05
Wallsend	1,080	8.88
Total	35,347	Average 7.88

From this table, obtained from best results, and the foregoing, there has been prepared the following table, which shows a saving of $46,012.15 per year by burning oil. But as it was based on the first test, it is safe to say that the minimum saving over coal is $60,000. This does not take into account wear and tear on the boilers, and general convenience:

STATEMENT OF COMPARATIVE VALUE OF OIL AND COAL. BASED ON THE FIRST TRIAL TEST.

COAL—Basis of 1897.

Total bituminous coal received during 1897	35,347 tons.
Average evaporation of that coal from and at 212°	7.88 pounds.
Total water evaporated on that basis	624,183,481 pounds.
Fireroom cost of handling that coal, reckoning 300 days at $64 26	$19,278 00
Cost of coal for this work on basis of present price—35,347 tons at $6.55	$231,522 85
(Have paid as high as $7 25 this month.)	
Total cost of evaporating above quantity of water coal	$250,800 85

OIL—Basis of $1.30 per barrel and 13.9 evaporation.

Barrels of oil necessary to evaporate above quantity of water	152,739
Cost of oil at $1 30	$198,560 70
Fireroom cost of handling that oil—300 days at $20 76	$6,228 00
Total cost of evaporating above quantity with oil	$204,788 70
Equivalent value per ton of coal on the above basis, $\left(\frac{\$204,788\ 70 - 19,278}{35,347}\right)$	$5 25
Saving on year's work by burning oil under the above conditions	$46,012 15

COMPARATIVE VALUE OF COALINGA OIL WITH DIFFERENT FUELS USED ON THE PACIFIC COAST.

Coal.	Evaporation from and at 212°.	Value per ton compared with Oil at $1.30.
Co-operative Wallsend	8.88	$5 53
Nanaimo	7.29	4 44
Greta	7.56	4 60
Bulli	7.26	4 42
Wallawah	7.70	4 69
Corral Hollow	4.32*	2 63

* See previous note.

This table is made up of average coal tests and compared with oil at $1.30 per barrel, and an average evaporation from and at 212° of 15.5 pounds. The intermittent demand for steam at the refinery does not allow them to work all the time on the most economical methods, and instead of a test evaporation of 16.4 pounds, the average evaporation comes to 15.5 pounds.

Many tests have been made at the refinery with air-blowing instead of steam, and it has been found cheaper, but as their demand for steam is subject to extreme fluctuations and as air-blowing does not "respond" as quickly as steam-blowing, it is not used under their boilers. It is now used under their kilns and gives great satisfaction. For a plant where the demand for steam is constant, it is much cheaper to use air-blowing. A different kind of a burner must be used; instead of the lip of the nozzle being less than 1 inch wide, as in a steam burner, it must be from 2½ to 3 inches wide, according to the flame desired. Air-blowing does not give as perfect a flame as steam-blowing, because the latter heats the oil and volatilizes it.

In using air to blow with, practical tests show that about 15% more air must be added than is necessary for complete theoretical combustion.

The National Ice Co. of San Francisco has burned crude oil with great success for some time. Their boiler plant generates about 250 H. P. They have until lately burned Los Angeles oil of 11° to 12° gravity, but tests are now being made with Coalinga oil. Five per cent of the generated steam is used to blow with, but an air-blowing appliance is soon to be put in. Their grate construction is a peculiar one, and, from the results and experiences of others, seems to be rather poor and wasteful. No target is used, the grate bars simply being covered with loose firebrick and the flame is shot along the bottom of the boiler, as in accompanying engraving. (See Fig. 4.)

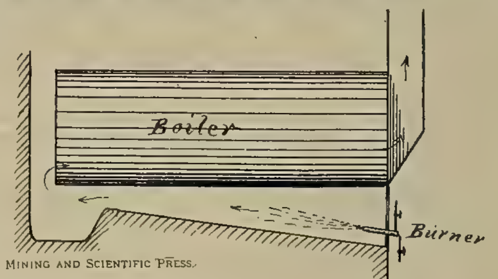

FIG. 4.

Probably the greatest future for crude oil burning in California is in metallurgical work, for there seem to be but few processes where it can not be applied. The Selby Smelting Works furnish a fine example of what can be done in this line with fuel oil. Here three Ropp furnaces and one Pearce furnace are fired with oil and give great satisfaction. The amount of heat to be used can be adjusted to such nicety that a saving can be effected. It needs no attention, and as there are no furnace doors to open and shut, the constancy of the air supply is never disturbed.

Two different methods are used for firing the Ropp furnaces. In one the burners are on the side of the furnace and in the other they are inserted through the top and point directly downwards. Mr. Ropp considers the latter method to be the more successful. Oil is also used in melting down the precipitated silver in a reverberatory furnace, in the retorts and in a large reverberatory slag furnace. Exact commercial figures could not be given, but it was understood that it was cheaper than coal, not to speak of the convenience and perfection obtained. The oil used is Ventura oil and is pumped from the Union Oil Refinery. All the oil used is blown with steam, air not having been tried as yet, but there seems to be no reason why it should not work equally well.

California contains rich copper ores which have not been worked, mainly on account of the high price of suitable fuel. It appears that the solution of this problem has come, and that crude oil is the key. So, in many respects, this natural fuel promises much, but it needs capital to make the necessary experiments. As a steam producer its value has been undoubtedly proven, at least for plants exceeding 100 H. P., but for the other uses experiment must yet determine its value.

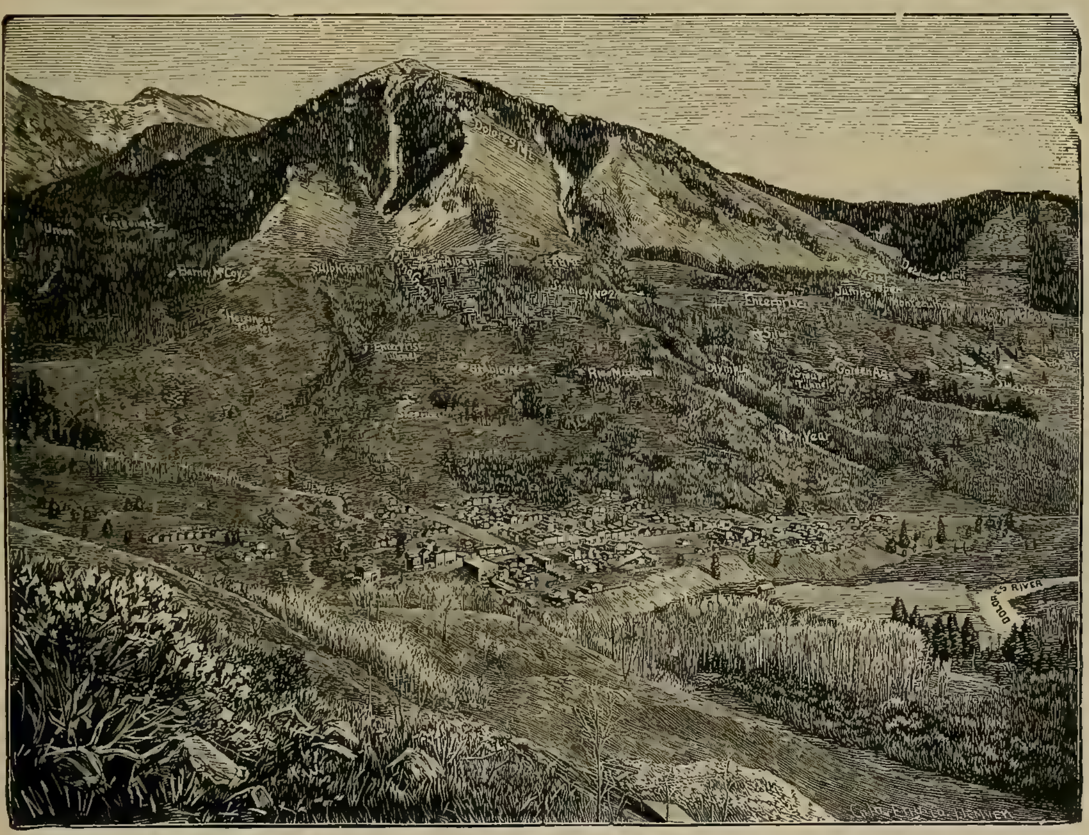
For the tables and figures herein given, and for their kindness and assistance, I am indebted to Mr. Oswald Rothmaler, manager of the Western Sugar Refinery; Mr. W. J. Wayte, engineer of the Western Sugar Refinery; Capt. Quinan, superintendent of the California Powder Works; Mr. Alfred Ropp, manager of the Selby Smelting Works, and Mr. Palmer, manager of the Union Oil Refinery.

A Tale of Two Engines.

"I saw two beautiful engines recently," says a machinery man, "that were perfect twins in every particular except one—there was a difference of about $400 in their cost. In design, finish, size, weight, power and every mechanical detail they were as like as two peas, and, as a matter of fact, they were from duplicate patterns, built in the same works at the same time. The variation in price was due to a curious business principle of the firm of builders, which, by the way, is one of the largest and wealthiest concerns in the country. The establishment never undertakes to construct an engine for a fixed sum of money. When it executes an order a careful account is kept of every item of expense—the cost of material, the pay of the men, the wear and tear of the tools, and anything else that contributes to the outlay. Then a fixed percentage is added for profit, the figures footed up and a bill rendered for the sum total. Now, anybody who has ever had any experience with machinists and machine building," continued the speaker, "knows perfectly well that no two men can accomplish exactly the same results. They will have their good days and their bad days, and unavoidable accidents, delays and breakage will sometimes make a difference of hundreds of dollars on identical jobs. As far as I know, all firms except the one I am talking about have a scale of averages on which they base their charges, and, while they occasionally lose on some particularly unluckly piece of work, they make it up on the next. But this house has always stuck to the old-fashioned, primitive system of charging the actual outlay plus a fixed profit, and it enjoys such a reputation for fair dealing that its figures are never questioned. Exactly what percentage repesents the profit I am unable to say. I have heard it stated at all the way from 5 to 15; but, whatever it is, it never changes and is exactly the same for big jobs and small."

Mines of Rico, Dolores County, Colo.

Rico is on the Dolores river, at an altitude of 8700 feet, in a section where the mountains are neither so high nor precipitous as is the case near Telluride and Ouray. The location of the mines here range from 9000 to 10,500 feet altitude, the slopes of the hills being such as to make the roads and trails that traverse them of comparatively easy grade. All mining interest centers on three different hills—Dolores and Telescope mountains, on the east side of the river, and Expectation mountain, on the west side. The earlier workings, which for years made Rico an active mining center, comprised those of the Enterprise and Rico–Aspen, on Dolores mountain, and the C. H. C., on Telescope. At a point in the north end of the town there appears to have occurred an up heaval, from which the formation dips. Thus, the strata of Dolores mountain dips, in the main, towards the south; that of Telescope to the north and northeast, while the dip of Expectation range corresponds to that of Dolores on the south and to the dip of Telescope on the north end.



Mines of Rico, Dolores County, Colorado.

The vein structure and ore bodies of Dolores and Telescope mountains have been pretty well exploited and determined, being quite similar on the two mountains, though different as regards character of ore. In general, the ore is found in nearly vertical fissures and contact deposits which apparently were fissures; there are also numerous vertical veins which form a part of the somewhat broken and irregular structure.

Telescope mountain is characterized by three great fissures cutting through it from northwest to southeast, nearly paralleling each other and being about 1000 feet apart at the apex of the mountain. These are locally known as the Logan, Leap Year and Bourbon fissures. The Logan, being the principal one, has been traced from Horse gulch, on the northwest, through Telescope mountain, across Silver creek, into Blackhawk mountain on the southeast, the Blackhawk being a spur from Dolores mountain. This takes in a distance of about 3 miles, and the fissure has been opened at points on contiguous claims the entire distance. The Leap Year appears to branch off from the Logan fissure on the southeast side of Telluride and join it again on the northwest side. The Bourbon fissure has been opened only on the western slope of Telescope and seems not so well marked as the Logan. The latter fissure is from 10 to 25 feet wide, carrying a lead and copper sulphide, with silver, lead and gold values; but at present depth of workings on this fissure the formation is so broken that the principal values have filtered down, and better values must be looked for at greater depth, where the formation is solid and the walls are intact. But the contact veins, which are an overflow from the fissures, lie between an iron capping above and a lime bedding plane below. These contact deposits drop down in benches, following the structure that has broken from the main formation and slid downward. Where the lime bedding plane is horizontal the values are held; where it is turned on edge the values have leached down and the ore thus found is low grade. The material, since being thrown from the fissures into contact deposit, has undergone a change—from a sulphide in the fissure to a carbonate in the contact. This has been demonstrated by the workings on the C. H. C. contact, from which a great many thousand tons of carbonate ore were shipped a few years ago, and by the workings on the Logan fissure, whose ore has been largely a sulphide of iron and lead. Over on Dolores mountain, in the Enterprise, for instance, the ore bodies were found in fissure veins, contact deposits and vertical stringers, but the formation was less broken, the vein matter more in place, and the values were uniform near the surface, because the walls were intact, and the ore itself was a sulphide, with no carbonates, as is the case on Telescope.

Two groups on the northwest slope of Telescope mountain, known as the Wellington and Logan groups, comprising about eighty-five acres, cover most of the claims on the Logan fissure and part of the Leap Year fissure, as well as a large portion of the contact ground lying on the slope adjacent to these fissures. These groups are in control of David Swickhimer, either by ownership or under bond and long-time lease. Much work was done on the two groups several years ago in the shape of tunnels, drifts and shafts. Considerable new work is now in progress. On the west end of Logan group a tunnel, 700 feet long, cuts along by the side of the fissure and on the contact; from it a drift is being run eastward to cut the Leap Year fissure and to open the contact between the two. The Logan fissure is also opened on the Uncle Ned, near the crest, on the Avalanche and Argentine, on the southeast slope, and on the Blackhawk and Little Maggie, on Blackhawk mountain. The Mountain Spring tunnel cuts 940 feet into the Wellington group, connecting by an upraise with the old Wellington level, from which considerable ore has been shipped. This tunnel goes toward the Logan fissure, and if driven 1000 feet farther would cut the latter at 1000 feet depth. But, as this tunnel level is below the contact, the new Wellington tunnel is being driven higher up the slope to cut the fissure at 1250 feet from entrance and 750 feet depth. It is believed that this tunnel will open the Logan fissure in solid formation, and will cut through a known contact of ore. Mr. Swickhimer and associates are not only developing the two groups named on the northwest slope, but the Uncle Ned, near the summit, and the Argentine, on the southeast slope, which they own. Following the Logan fissure into the Blackhawk and Little Maggie workings, the ore becomes a sulphide, with some zinc and heavy lead values.

Summarizing as to Telescope hill, the contact ores above the horizontal bedding planes are high grade, carrying silver and lead; great areas of such ground remain undeveloped. But the fissures, especially on the northwest slope, which are opened only to a depth of 260 feet, have at this depth broken walls and low values in silver, lead and gold; but future work is to determine whether there are higher values at greater depth, where the walls and formation are solid.

On the northern section of Expectation mountain I went into the Sambo, which is developed by a 400-foot tunnel, a 250-foot drift and some stoping. Here is found a contact vein between a lime and sandstone wall above and a stratum of "short lime" below. The ore carries a sulphide of lead, with some zinc. Here the contact is much broken, showing evidence of that section through which the tunnel goes having slid downward; but, on going in on a tunnel at a higher elevation, a point is reached where the formation is regular and the contact in place. Here the contact dips to the north about 7 feet to the 100 feet.

The lower bench of Dolores mountain, sloping toward the river, is called Enterprise hill, being the location of the Enterprise mine, originally opened by David Swickhimer. The Group tunnel, located by Charles Newman after the Enterprise mine was opened on a bench higher up, undercuts the Enterprise contact, having upraises to it. This tunnel has been driven about 5000 feet from the entrance, connecting with over 30 miles of workings on the contact above it. Last year a concentrating mill was erected, just below the Enterprise dump, by the Colorado Milling & Concentrating Co., made up of Telluride and Pittsburg people. It was equipped with crushers, rolls, Huntington mills, gravity sizers and Wilfley tables. The sizers grade the ore for the different tables. The Huntingtons grind to about 30-mesh. The mill was built to run on a dump of about 750,000 tons, on ore from the old stopes and low-grade ore in place. The values in the dump are believed to run not lower than $4.75 per ton; that of the stopes, $4.75 to $7.50 per ton; the product is about one-third gold and two-thirds silver and lead. This company has a time lease on the dumps and stopes mentioned. The mill has run part of the season and will soon start up again. The concentrate product, resulting from reducing about thirty tons to one ton, carries 25% to 30% iron, 9% to 11% silica. This enormous dump is the refuse from eleven years operating, during which time nearly $10,000,000 were produced.

Farther southward on Enterprise bench of Dolores mountain are the Rico–Aspen, Newman group, Jumbo and other well-known mines. From a point up Silver creek the Scoutt tunnel, now in 2000 feet, is designed to cut under the same contact at greater depth than are the Enterprise or Rico–Aspen workings.

The zinc proposition is of special interest at Rico at this time, because of the possibility of zinc production becoming an industry here. Thomas Jones, representing George E. Nicholson, operator of zinc works at Iola, Kan., and Nevada, Mo., has been on the ground for some time and has secured a five-year lease on 230 acres on the south spur of Expectation mountain and twelve acres on Enterprise hill; and may negotiate for the Atlantic Cable group of fifteen claims, extending from Expectation range northeasterly. Mr. Jones has also acquired the old sampler and concentrator, on the railroad track, which he is equipping for a zinc concentrator. With this he hopes to be able to make a fairly clean separation of the zinc sulphides from the lead and iron. He will use crushers, rolls, jigs and tables. There are zinc ore bodies here, specimens of which run from 50% to 57% zinc; but the extent of such ore has not been fully determined. The Missouri zinc ores are a "black-jack," theoretically two-thirds zinc and one-third sulphur. But the zinc here consists of a brown zinc-blende, containing a good per cent of silica, and associated with chalcopyrites and lead, the crystallization of sulphur giving it the brown color; also is found here the "rosin-jack," a zinc ore, which is free from gangue and other material. Both these classes of zinc ores here are mechanically, not chemically, combined with lead, iron and other minerals, which makes possible a separation by concentration. In some special cases, however, the chemical combination does exist in Rico ores. The zinc ores at Leadville are chemically combined with iron and lead and are strictly a smelting proposition. In an open cut on the Atlantic Cable they ran through a cap rock of lime into a zinc sulphide, with crystals of galena; 200 feet north of this point a shaft was sunk 25 feet, getting into specular iron, with no zinc. Zinc ores were found also on the Argentine, up Silver creek; also, on the Shamrock, a quarter-mile west of the original open cut on Atlantic Cable. On the Silver Swan group, leased by Mr. Jones from J. J. Cohnan, there is a 1000-foot tunnel, with upraises on vertical veins to a contact, bearing a very pronounced character of zinc ore, associated with lead and chalcopyrites. Mr. Jones has just shipped fifty tons of Rico's typical zinc ore to his works at Nevada, Mo., on which to make a test run.

The Rico district has been very quiet for several years, but there are good indications of a revival of former activity. WASCOTT.

Rico, Sept. 15.

Filtration Instead of Distillation for Petroleum.

It has been known for years that, when lubricating oils or warm vaseline, and especially cylinder oils, are filtered through animal charcoal, and more recently through fuller's earth, the color is made much lighter. It is now well known also that this filtration changes the specific gravity and the corresponding viscosity of the oil, says David T. Day, of the U. S. Geological Survey, in an address at Paris before the Petroleum Congress, assembled at the Exposition.

"The fuller's earth used for this filtration is a very porous variety of clay, so porous that it adheres tightly to the tongue. Chemically, it is a clay very rich in silica and in combined water. There is great difference in appearance and in chemical composition between the fuller's earth from different localities. For example, there are two quite different varieties of fuller's earth from Reigate, Surrey, England, and both differ markedly in composition from the variety of fuller's earth found in Florida. This latter also is preferable as a filtering material for petroleum oils.

"These different varieties of fuller's earth shade into the other varieties of clay, and their filtering capacity likewise grades off, and we find that ordinary shales and clays show some filtering capacity, though perhaps not more than one per cent as great as with the best fuller's earth. Fine sandstones, however, show little or no filtering capacity.

"Naturally, the partial separation of the oils in crude petroleum by filtration, as I have shown it, offers good hope for complete separation by this means, and as such I humbly offer this method through this Congress to the investigating world, and wish to state that I believe, before the next winter is past, I will have effected entire separations.

"The first efforts will be guided by what we know we can effect by distillation, and small quantities of my filtrates will be tested until they show constant boiling points and other characteristics of simple chemical compounds. But even if only primary separations could be effected by this means of heavy (and easily decomposed) hydrocarbons from lighter ones, so that in distillation the latter might not be distilled by the former, a great advantage would have resulted. But I believe that we will effect complete separations.

"As to the practical value of this process, its great promise is as a scientific means of separating the mixtures of oils with which we now deal. Imagine the gain if we can thus define as a standard of quality for a given lubricating oil that it shall contain fixed percentages of definite hydrocarbons, instead of refining the oil by flashing point, density and viscosity. Further, when we know which of these fundamental hydrocarbons yield the most beneficial oils we can then regulate our processes of manufacture to secure the greatest yield of these constituents."

Underground Oil Tanks in Canada.

Canadian oil producers use for storing crude oil holes dug in the ground, thus described by J. D. Noble:

These underground tanks are circular in form and dug to any capacity required, the clay in the Canadian oil region being specially adapted for this purpose. There is 100 feet of tallow-waxy kind of blue clay to go through before the top rock is reached; a number of petrified cockle shells are found in this clay, which clay is perfectly impervious, and so compact that it will hold either oil or water when the hole is dug out without leaking a drop. Expert workmen trim down the walls with their spades until they become smooth and shining, and when the hole is dug out they commence at the bottom and ring it up to the top with solid wooden rings. These rings are formed of kants, which are pieces of Canadian pine lumber cut in the form of the segment of a circle, and shaped just to fit the circular wall of the tank; they are from 3 to 4 feet long, according to the size of the tank, 5 inches wide and 1 inch thick, and the joints are covered by the top piece as the workmen proceed to nail them together from the bottom and ring up the tank. This wooden lining is put in to prevent the possibility of any clay caving in. The tanks for holding crude oil are generally dug 30 feet in diameter and 60 feet deep, and hold about 8000 barrels in bulk of thirty-five imperial gallons to the barrel. It is only after sinking down about 20 feet that this peculiar formation of tallow-waxy kind of blue clay is found, the first 20 feet being a rich alluvial deposit formed from the dropping of the leaves of the trees for a long period of years. The blue clay is taken from the bottom of the tank, and puddled about 1 foot thick behind the wooden curb for the first 20 feet, thus forming a perfect water-tight tank, which is then covered by large timbers and 2-inch planks with a coating of gravel on top. Oil has been held in such tanks for ten years without leaking a drop, and there is no danger from lightning, which has caused so many disastrous fires from oil stored in large iron tanks.

The Canadian crude petroleum when pumped from the wells is of a dark green color, and the gravity is from 32° to 37° by the Beaume hydrometer, according to the locality in which it is pumped. It is worth at present 7s per barrel of thirty-five imperial gallons to the barrel, in bulk at the wells, and it costs 2s per barrel to produce.

There are no flowing wells in Canada; all the oil is produced by pumping. The crude oil when distilled contains 5% of benzine and 42% of illuminating oil.

After the illuminating oil is taken off, the heavy vapors are blown out of the still by an injection of steam and condensed and sold for gas or liquid fuel, and the balance of the still is petroleum tar, which is very rich in paraffine, and from which a large percentage of wax is obtained for making candles. It is also manufactured into lubricating oils of the very finest quality, and the residue makes a very superior fuel, being very rich in carbon.

The wells are 4½ inches in diameter and 475 feet deep. At a depth of 460 feet the oil-bearing rock is pierced, and at this point a nitro-glycerine torpedo is exploded to shatter the rock and allow the oil more freely to flow into the well.

Experiments Regarding the Influence of Silica on the Loss of Silver in Scorification.[*]

The fact that the loss of silver in the slag of the smelting process increases with the amount of silica in the furnace charge was probably the ground of a general opinion that the silver is present in the slag as a silicate. Dr. Iles, in his interesting experiments upon the slags of scorification, found in no instance any silicate of silver. These experiments, however, were made with pure crystals of $AgNO_3$—a circumstance which may have affected their results, since it is conceivable that an intimate mixture of metallic silver with silica might more strongly favor the formation of a silicate. Fusing at a low heat for three hours, and then allowing to cool, 6.8 grammes of $AgNO_3$ with 1.2 grammes of pure anhydrous SiO_2 (these proportions corresponding to the equation $2AgNO_3+SiO_2=Ag_2SiO_3+N_2O_2+O_3$), Dr. Iles obtained a bright brick-red slag, the color of which was due to Ag_2O_2.

The only other experiments of interest bearing upon this subject are the crucible assays reported by Mr. Furman, of which Nos. A1 and A2 have special interest. In these instances he assayed 108.15 and 102.75 milligrammes of silver with ½ A. T. of SiO_2, and found the losses to be 2.47% and 1.93%, respectively. These are small losses. With low-grade ores, Mr. Dewey found the loss higher, as was also the result in the experiments described below. Mr. Furman assayed also 116 milligrammes of silver with 7.5 grammes of SiO_2 and 7 grammes of FeS, and found the loss of silver to be 4.66%. This is smaller than the losses (5.2% and 5.3%) shown by Experiment No. 4, described below, in which SiO_2 and FeS_2 were ingredients. It would seem that, in an assay of silver with silica, the presence of a sulphide of iron tends to keep the loss of silver nearly constant.

In order to test the influence of silica in the scorification assay, the following experiments were made:

In these experiments pure ores (pyrite, zincblende, galena or stibnite), sulphur, silica and test lead—all free from silver—were mixed with filings of silver, 0.992 fine and free from iron. No borax glass was added, since it was desired to avoid, as far as possible, the introduction of factors which might affect the result. In all cases, with two exceptions, the temperature of scorification was between 900° and 1000° C. The cupellations were made with "feathers."

The influence of silica being the special object of inquiry, other conditions (such as temperature, amount of silver and amount of test lead) were kept as nearly constant as possible to facilitate the comparison of results.

The table below shows the quantities of each ingredient of the charge and the results obtained, other conditions of the experiment being stated in the following:

REMARKS.—All the assays were made in duplicate. In the column under "Silver," the amounts of silver actually weighed out are given. The following columns, for comparison only, give the average results.

Experiment No. 1.—In this case the "low heat" was just sufficient to melt the lead, and the smaller percentage of silver recovered was due to the long period of scorification, which permitted a larger quantity of silver to enter the slag. The "high heat" was a white heat, and the loss here was probably due to volatilization.

Experiment No. 2.—As was to be expected, these assays show increasing loss of silver with increase of silica.

Experiment No. 3.—Here the addition of 6 grammes of SiO_2 increased the loss of silver.

Experiment No. 4.—In this case the addition of SiO_2 increased the loss of silver; but variation of the ratio of SiO_2 to FeS_2 seems to have had no material effect in this respect.

TABLE OF SCORIFICATION ASSAYS.

EXPERIMENT, No.	Ore, Gms.	Test lead, Gms..	Silica, Gms....	Silver, Mgs....	Average silver recovered, Mgs.	Average recovery, %........

	1	50	2	50.60 50.90	49.18	97.25

Experiment No. 5.—The assays show that the addition of silica increases the loss of silver and that this loss is diminished by a decrease in silica and an increase in zincblende. The well-known effect of zincblende, per se, in augmenting the loss of silver was shown by additional assays (not reported in the table), in which still larger quantities (6, 8 and 10 grammes) of zincblende were present, with no silica. These assays yielded black, pasty slag and very brittle (and in the last instance, with 10 grammes of zincblende, very small) buttons, which could not be cupelled.

Experiment No. 6.—In these assays the amount of test lead added was so proportioned to the lead in the galena as to make 50 grammes as the total lead in the charge. With 4 and 10 grammes of galena the results were peculiar, the loss of silver being smaller than with 2 grammes of galena, while the assays with 6 and 8 grammes of galena showed proportionately larger losses of silver. The addition of 6 grammes of silica, 1.5 grammes of galena being present, was followed by increased loss of silver; but the combination of 3 grammes of galena with 2 grammes of silica resulted in the recovery of the largest percentage of silver, with one exception, in the whole galena series.

Experiment No. 7.—In these assays the increase of sulphur in the charge from 0.5 to 1 gramme seems to have reduced the loss of silver, as the increase of sulphides seemed to do in preceding experiments. But the reduction of silica from 6 grammes to 2 grammes increased, as in other cases, the proportion of silver recovered.

CONCLUSIONS.—The preceding experiments indicate that the behavior of the metallic sulphides in scorification with silica and silver is not uniform, but varies with the nature of the ore. Evidently more extended investigation would be necessary to determine the cause and law of this variation. These experiments, however, appear to warrant the following conclusions:

1. That in assays of pure silver and lead an increase in the amount of silica present increases the

---

[*] LESTER STRAUSS, Canadian meeting, August, 1900, American Institute of Mining Engineers.

loss of silver in the slag. This fact was already well known.

2. That in the presence of sulphides an excess of silica increases the silver loss, but that this loss is apparently diminished when sulphides are present with a relatively smaller amount of silica.

3. The experiments, though by no means conclusive, suggest that the same recovery of silver cannot be expected from different mixtures or ores of the same silver value.

Dr. Koenig, after observing that the student (operating with various type mixtures, each containing exactly 300 ounces of silver per ton) "finds that the loss of silver is not at all the same, but that this loss can vary from 3% to 16% with the best work possible," adds that an assay "made with clean sand, the 30 milligrammes of silver wrapped in lead foil, being placed on the top of the charge, sand and test lead, * * * gives the minimum loss." The experiments above reported and the results obtained by Messrs. Furman and Dewey seem to require a modification of this statement, since they indicate that the silver loss would be dependent upon the amount of silica present, as well as upon the other ingredients of the charge.

My thanks are due to Dr. E. H. Miller for friendly advice and assistance in the experiments above described.

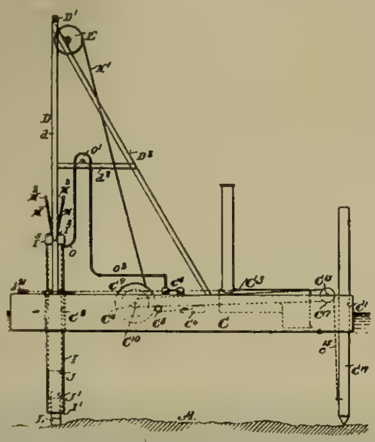
◆

Mining and Metallurgical Patents.

Patents Issued September 11, 1900.

Specially Reported for the MINING AND SCIENTIFIC PRESS.

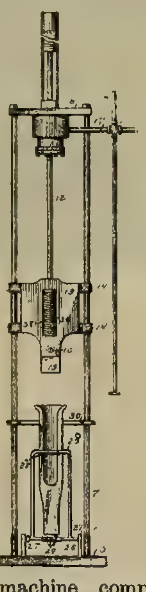
SUBAQUEOUS ROCK BREAKER.—No. 657,515; B. H. Coffey, Philadelphia, Pa.



Framing or derrick, as D D′, having guides, as D³, in combination with tubular caisson arranged to extend down into water beneath derrick, weight vertically movable in caisson and adapted to hold rock-breaking chisel, rod, as K, extending through stuffing-box in top of caisson adapted to connect with weight aforesaid to raise it, crosshead as K², moving in guides D³ and connected to top of rod K, cord connected to crosshead and leading over pulley on derrick to hoisting drum, means, as hook arms M M, for connecting top of caisson to crosshead K² and means, as clamp G, for holding caisson in depressed position.

◆

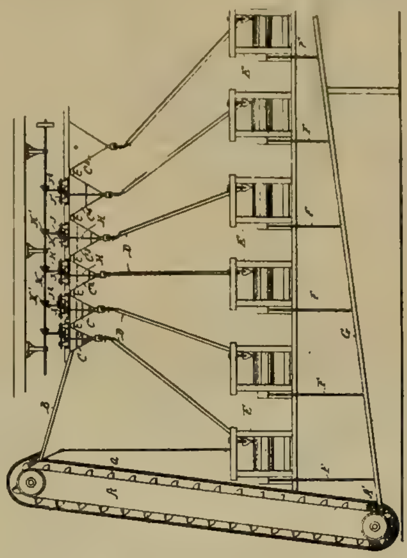
APPARATUS FOR REPAIRING DRILLS.—No. 657,519; P. L. Crossman, Joplin, Mo.



Steam swaging machine comprising uprights, crosshead slidably engaged with uprights, steam cylinder, piston for cylinder having rod slidably engaged with crosshead, cushion between end of rod and crosshead, base for uprights, ears upon base, rock shaft pivotally mounted in ears, drill holder mounted upon shaft comprising U-shaped bar attached at its ends to shaft having its end adjacent web bent laterally provided with crossbar connecting arms of U-shaped bar at bends to form rectangular inclosure, seat upon shaft for butt of drill, means for rocking shaft, stop bar upon uprights for contact by drill in frame to stop drill in operative relation to crosshead, having hammer engagement with drill in frame.

◆

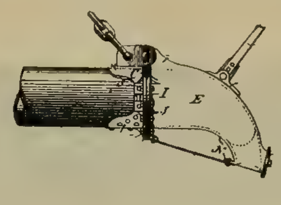
ORE CLASSIFYING APPARATUS.—No. 657,553; J. S. Loder, Ouray, Colo.



Apparatus for classifying ore pulp, combination of elevator for elevating pulp, conduit leading therefrom to first of series of V-shaped separating receptacles, each receptacle containing vertically adjustable shaft carrying revolving diaphragms for agitating and elevating lighter particles of receptacle, each provided with valved discharge opening at or near its bottom, conduit leading from lower end of each receptacle to one of series of concentrators, and conduit leading from upper end of each receptacle to receptacle next adjacent.

◆

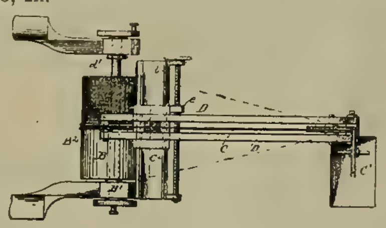
MOUTHPIECE OR DRAG FOR SUCTION PIPES FOR DREDGERS.—No. 657,568; A. W. Robinson, Milwaukee, Wis.



Combination of suction pipe, drag or mouthpiece, hinge connection between two at upper side of pipe, means upon side opposite hinge whereby mouthpiece will be held in operative position unless subjected to excessive strains.

◆

HOISTING APPARATUS.—No. 657,689; H. C. Behr, San Francisco, Cal., assignor to Fraser & Chalmers, Chicago, Ill.



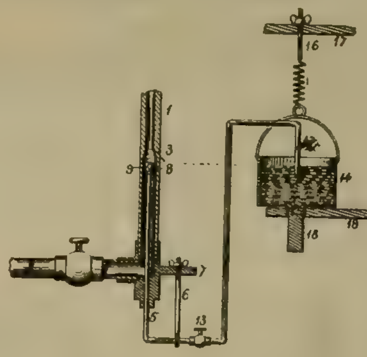
Combination with winding drum, of pit sheave, guide sheave located distance therefrom, rigid connection between sheaves, longitudinally movable device to which upper end of frame is flexibly connected, laterally movable carriage to which frame is pivotally connected at lower end, mechanism for causing carriage to traverse winding drum with laying on or off of rope or cable so that rope-leading edge of guide sheave mounted within frame will move within plane tangent to winding face of drum.

◆

PROCESS OF SEPARATING PRECIOUS METALS FROM THEIR ORES.—No. 657,181; H. De Raasloff, New York, N. Y.

Continuous process of treating ores of precious metals, consisting in mixing finely divided ore with suitable solvent for precious metals, inducing mixture to flow continuously from the back to point of admixture, while so flowing introducing liquid oxygen or liquefied air into mixture, then causing mixture to flow with sudden variations of velocity to agitate it, then separating solution from base earthy mineral matter, and sending it continuously through electro-depositing bath, where precious metal is deposited, thus in continuous ordered succession.

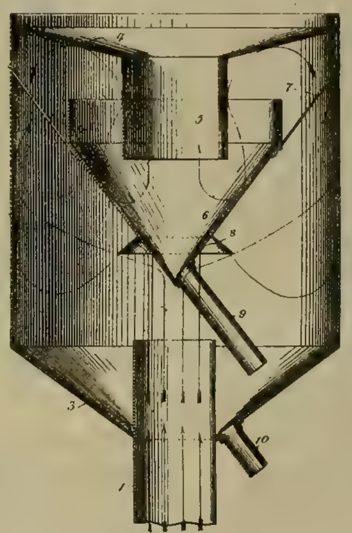
VAPORIZER FOR PETROLEUM ENGINES.—No. 657,739; G. Kiltz, Marengo, Ill.



In a gas engine, an air supply pipe having upper portion contracted, oil pipe located within air pipe supporting nozzle at upper end and located below contracted portion of air pipe, nozzle being in conical form having an end plate provided with series of perforations, air passageway extending obliquely through nozzle having outlet located about center of top of nozzle.

◆

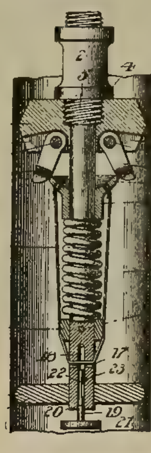
EXHAUST HEAD.—No. 657,748; S. M. Scott, New York, N. Y.



Exhaust head consisting of cylindrical metal shell 2 provided with cone-shaped bottom 3 and downwardly extending cone-shaped top 4; together with downwardly extending tube 5 secured to top, lower end tube extending into combined cylindrical cone-shaped deflector 6 secured to inner surface of shell 2 by arms 7, 7; in combination with reverse cone-shaped deflector 8 of slightly greater diameter than exhaust pipe 1 secured directly to lower end of combined cylindrical and cone-shaped deflector 6 in such manner that exhaust steam is caused to be thrown against entire inner surface of cylindrical metal shell 2 and its bottom and top 3, 4, and afterward deflected against inner surface of combined cylindrical and cone-shaped deflector 6, ultimately passing out through tube 5, drain pipes 9 and 10 being provided, former for conveying all the moisture from inner surface of deflector 6 and exterior surface of deflector below reverse deflector 8 upon its outer surface, latter for conveying all the condensed moisture from entire exhaust head.

◆

TOOL FOR PERFORATING PIPES.—No. 657,777; G. W. Kellogg, Bakersfield, Cal.



Perforator for pipes, comprising shank, head carried thereby, series of cutters carried by head, collar slidably mounted upon shank for forcing cutters into contact with pipe, spring for actuating collar, wire for restraining spring, and cutter for severing wire to release spring.

Volumetric Method for the Determination of Copper.

By Richard K. Meade.

The average analyst is often deterred from the use of a volumetric method by the necessity of making and standardizing a special solution. In many cases it takes nearly as much time to ascertain the strength of the required solution as it does to make the analysis itself, and the standardization and analysis together render the volumetric method frequently as slow, if not slower, and vastly more toublesome than the gravimetric determination.

Volumetric analysis, therefore, becomes more and more an ideal method of quantitative determination as it approaches the requirement of a single standard solution, capable of having its strength accurately determined by simple means, giving a clear, definite, clear end-reaction.

In iron and steel laboratories permanganate is fast coming to the front as a help to rapid analysis. Iron, phosphorus, manganese, sulphur (Payne's iodine solution is prepared by adding standard permanganate to potassium iodide), and calcium can all be quickly determined by the use of one standard solution. While it may never be possible to supplant other standard solutions by permanganate, still the sphere of its usefulness is a large one and is constantly enlarging.

A new method for the determination of copper by permanganate, which seems to possess many points over the old one of reduction by grape sugar, in general is as follows: The copper is brought into solution as a sulphate, either by dissolving it in sulphuric acid or evaporation of its solution with sulphuric acid. The greater part of the free acid is neutralized by ammonia, the solution warmed, sulphurous acid added until the solution smells strongly of the reagent, and then a slight excess of ammonium or potassium thiocyanate. The copper is immediately precipitated as cuprous thiocyanate. Stirring and warming renders the precipitate heavy and easily handled. The solution is filtered through asbestos, using the pump, and well washed. The precipitate and filter are thrown into the beaker in which the precipitation was made and heated with a solution of caustic soda or caustic potash. Double substitution takes place. Hydrated cuprous oxide and potassium or sodium thiocyanate result.

$$2CuSCN + 2KOH = Cu_2(OH)_2 + 2KSCN.$$

The oxide is filtered on asbestos and washed well with hot water. The precipitate and filter are again placed in the same beaker and an excess of ferric chloride or ferric sulphate (free from nitric acid, free chlorine or ferrous salts), together with a little dilute sulphuric acid, added. The copper oxide reduces a corresponding amount of iron from the ferric to the ferrous condition.

$$Cu_2O + Fe_2Cl_6 + 2HCl = 2CuCl_2 + 2FeCl_2 + H_2O.$$

The beaker is warmed and stirred until all the copper oxide is dissolved. The solution is then poured through a perforated platinum disc and the asbestos which stays behind upon it washed with water, to which has been added a little sulphuric acid and a little ferric chloride or sulphate. The solution is then titrated with permanganate. The iron equivalent to the permanganate used multiplied by 1.125 gives the weight of copper in the sample.

Instead of sulphurous acid, ammonium or sodium bisulphite may be used to reduce the copper. A solution of equal weights of sodium bisulphite and potassium thiocyanate answers well as a reagent for the precipitation of the metal. Since copper is the only metal precipitated by an alkaline thiocyanate from an acid solution, the presence of arsenic, antimony, bismuth, zinc and other materials which render the electrolytic, the cyanide and the iodine method inaccurate will not affect the results.

The caustic alkali solution, used to convert the cuprous thiocyanate into cuprous hydroxide, must not be too strong or some of the metal will go into solution, coloring the liquid blue. I have used about a half normal solution of caustic potash, made by dissolving twenty-eight grammes of the salt in a litre of water. Either ferric sulphate or ferric chloride may be used to dissolve the cuprous oxide. The former is probably the safest, but the latter appears to dissolve the precipitate the more readily of the two.

As a test of the accuracy of the method four grammes of pure electrolytic copper were dissolved in nitric acid and the solution evaporated with sulphuric acid until the nitric acid was expelled. The solution was cooled and diluted to one litre. The copper contained in fifty c.c. was then determined electrolytically with the following result:

	Gramme.
1	0.2003
2	0.2003
3	0.2000
4	0.1997
Average	0.2001

The copper in fifty c.c. was determined by the thiocyanate-permanganate method outlined above. The permanganate solution used was made by dissolving 5.02 grammes of pure crystallized potassium permanganate in water and diluting after standing twenty-four hours to 2 litres. Its strength was determined by titration against iron wire and against ferrous ammonium sulphate.

Against ferrous ammonium sulphate:

Gramme iron.
1. One c.c. = 0.004455
2. One c.c. = 0.004456

Against iron wire:

Gramme iron.
3. One c.c. = 0.004460
4. One c.c. = 0.004449

Average one c.c. = 0.004455

One c.c. = 0.004455 × 1.25 = 0.005012 gramme copper.

Below are the results on fifty c.c. of the copper solution containing 0.2001 gramme copper by the thiocyanate-permanganate method:

No.	Permanganate. c.c.	Copper. gramme.
1	39.6	0.1985
2	29.5	0.1980
3	39.6	0.1985
4	89.7	0.1990
5	40.0	0.2004
6	39.8	0.1995

In determination numbers 1, 5 and 6 ferric chloride was used to dissolve the cuprous oxide; in numbers 2, 3 and 4 ferric sulphate was used.

As a further and more practical test of the method, the copper in some samples of copper was carefully determined by the electrolytic and then by the thiocyanate-permanganate method. Below are the comparative results:

SAMPLE.	Weight of sample Gramme.	Permanganate... c.c.	Copper by thiocyanate-permanganate method.. Per ct.	Copper by electrolytic method... Per ct.
1—Chalcopyrite I	1.0	39.6	19.85	19.95
2— "	1.0	39.3	19.70	19.86
3—Chalcopyrite II	2.0	24.6	6.16	6.37
4— "	2.0	24.8	6.21	6.30
5—Malachite	1.0	72.2	36.19	36.10
6— "	1.0	72.2	36.19	36.15
7—Tetrahedrite	1.0	42.0	21.05	21.06
8— "	1.0	41.7	20.90	21.18

It will be seen by the above results that the method is accurate enough for ordinary commercial purposes. In spite of its three filtrations, the method is quite rapid. Not counting the time required for solution of the ore, duplicate analyses can be easily made in from a half to three-quarters of an hour.

In the writer's opinion the process is superior to both the iodine and the cyanide method. It requires the use of no rapidly changing solutions, but one which every analyst has on hand nearly all the time. The end-reaction is clear, distinct and familiar to all chemists. The method is applicable to any ore, matte or alloys. It is as rapid as the cyanide, except in certain cases favorable to the latter, and more rapid than the iodine method. Finally, not the least of its points of advantage is that it is more accurate than either of the two.

On the occasion of the recent celebration in San Francisco of the fiftieth anniversary of California's statehood 13,000 additional electric lights illuminated the principal streets.

Preparation of Roofing Slate.

In the last few years California has produced 23,450 squares slate. A square of slate is 100 square feet as laid on the roof. El Dorado and Shasta counties furnish the most of California slate, the demand for which is still limited. As population increases the demand for slate will be more commensurate with its merits. In some Eastern States the slate industry is a great one. From January 1 to August 23, 1900, Slatington and Walnutport, Pa., shipped 122,952 squares of slate. In Allentown, Pa., is published a trade journal styled Cement and State. To it we are indebted for the accompanying illustration depicting the preparation of roofing slate for the market. The illustration on this page represents the interior of a slate shanty on the bank, where roofing slate is split and squared ready for the market.

The large blocks are broken away from the strata or ledges in the quarry principally by blasting, and then worked away from their position and loaded upon small platforms, which are raised by means of a wire rope running along a stationary cable. This deposits it on the bank, either near the shanty or upon a truck, by means of which it can easily be transferred to that place.

Here it is dumped with many more of its kind, although it is not very good management to have too many blocks waiting to be cut, for if they are allowed to dry out, it is almost impossible to cut them up without a great deal of waste. To prevent this drying out, wet cloths are sometimes spread over the blocks, or they are wetted by sprinkling water over them. Three men are required to change the rough angular blocks of slate rock into the regular shapes of roofing slate. The first one "makes the blocks," that is, he makes a mental calculation as to what size of slate can be cut most advantageously from the rock before him. On this man's judgment depends the size of the waste heap, and consequently the size of the dividend at the end of the year. He must be able to judge rapidly and accurately the proper cuts to run across the stone.

To cut a large mass of stone, such as this is, at will, requires considerable skill. It is done in this way: The stone is laid on end and a groove cut across the edges of the laminæ, the same is repeated on the other side and a thin line chiseled out, connecting these two grooves. Sometimes while this last line is being cut, the stone separates, but frequently it must be stood on end and broken with blows from a hammer.

After these blocks have been formed, the slate splitter takes them, and by means of a thin wedge or chisel, which he inserts between the ends of the leaves, he splits them into pieces of the required thickness.

Preparing Roofing Slate for the Market.

After these blocks have been formed, the slate splitter takes them, and by means of a thin wedge or chisel, which he inserts between the ends of the leaves, he splits them into pieces of the required thickness.

To do this well requires experience, for if the slates run very uneven, as to thickness, they make poor roofing material. The pieces of slate are still irregular in shape and to put them into marketable condition they must be cut to size. This is done by the dresser. Before him stands what might be called a skeleton table, at one end of which is a knife operated by foot power. He first cuts a straight edge on the slate, then lays that edge along a line or pushes it against the back of the machine, which has been set for a certain size of slate and brings down the knife, thus forming two straight sides of the slate. The others are cut in the same way. After this the square slates are transferred to the shed on the bank and are ready for shipment.

The Colorimetric Assay of Copper.*

By J. D. Audley Smith, Clifton, Arizona.

Heine's "blue test" for copper, as described by the authorities generally, calls for a set of standard colors; and there has been some discussion concerning the relative superiority, for this purpose, of sulphate and nitrate solutions. The whole matter evidently hinges on the preservation of the standard colors in well-stoppered bottles. The apparatus described by G. L. Heath cannot be much improved, when very accurate readings are required.

The following method was devised for the purpose of doing away with preserved sets of standard colors, by making a fresh standard for each batch of assays. The solutions are prepared in the usual way, each ammoniacal solution being filtered into its separate bottle, and then filled up to the containing mark and thoroughly mixed. A similar color bottle, with an "S" etched upon it, to distinguish it from the other bottles, which are numbered to correspond with the samples, is kept to run the standard. About 150 c.c. of water is put into it, and then the amount of acid (sulphuric or nitric) present in each determination, followed by 30 c.c. of ammonia (s. g. 0.90), which should make the mixture strongly ammoniacal.

The liquid is now made up almost to the containing mark (200 c.c.), say within 1 c.c. The lowest assay is selected first and placed alongside the standard, which, at the beginning, contains no copper. A copper solution is then dropped into the standard from a burette; and after each addition the bottle is well shaken and compared with the assay sample. This operation is continued until the two shades match exactly, when the burette is read and the assay result is calculated. The assay next in order of depth of color is now taken and treated in the same way, and so on, until the batch is completed. It will be found that the volume of the deepest colors is from 1 to 2 c.c. less than the standard, which has increased by successive additions of copper solution. This is corrected by adding the necessary amount of water to the assay, just before the last one or two drops of copper solution are added to the standard.

DETAILS OF THE METHOD.

The copper solution contains 5 grammes c. p. copper per 2000 c.c., and is made by dissolving the metal in a small quantity of nitric acid and diluting, so that 1 c.c.=0.0025 gramme Cu.

It is convenient to have a syphon attachment, for filling the burette with this solution.

Tailings Assay. — One gramme is digested on a hot plate with from 3 to 5 c.c. of HNO_3 to 3 c.c. of HCl, and 5 c.c. of H_2SO_4. Rapid heating will soon decompose the mineral; and the treatment should be continued until the sulphur globules which form are quite yellow. Add about 30 c.c. of water; then an excess of ammonia water (s. g. 0.90). Mix thoroughly and filter hot, through a S. and S. folded filter No. 588 or a very rapid paper. Wash the iron precipitate twice with $\frac{1}{10}$ ammonia water; then dissolve off again into the original vessel with 5 c.c. of 1 to 1 H_2SO_4 and hot water. By lifting the filter and its contents out of the funnel, then opening it out and washing back the precipitate with a jet into the original vessel, the operation can be performed in less than a minute, and with very little water. The solution is now reprecipitated with ammonia, and the filtrate is combined with that obtained from the first precipitation. One final washing is enough ($\frac{1}{10}$ ammonia) for any material not running over 1.5% of copper.

Slag Assay.—One gramme is boiled in a dish with 15 c.c. of water; then 5 c.c. of HNO_3 is added along with 5 c.c. of 1 to 1 H_2SO_4. The digestion is carried on until the slag is thoroughly decomposed, and any sulphur globules are yellow. It is not necessary to dehydrate the silica; and as decomposition is immediate, there is rarely any delay at this point. The assay is now treated in the way as described above for the tailings assay; only, care should be taken to avoid using too large quantities of water in washing and transferring precipitates. A third precipitation of the iron has always resulted in a filtrate free from copper when working on blast furnace slags; but in analyzing high-grade slags, some copper may remain in the second precipitate.

The standard is prepared as already described, and the colors are carefully matched. When one gramme is taken, each c.c. of copper solution is equivalent to 0.25% of copper.

The following table shows the results of a batch of assays occurring in the daily work of a large copper plant, and illustrates what may be expected from the colorimetric assay in a busy office. The samples are varied, consisting of mill tailings, slags and lean ores. The results are not so close as those given by Mr. Heath in his paper; but he says that his electrolytic assay was made on the solution which he had used for his colometric assay. The electrolytic assays tabulated below are separate determinations on a separate weighing of the sample, the copper being precipitated from the acid solution of the ore without any previous separation of iron by ammonia.

COMPARATIVE RESULTS OF COLORIMETRIC AND ELECTROLYTIC ASSAYS.

No.	Colorimetric Assay.		Electrolytic.	Remarks.
1...	1.	1.02	1.06	Electrolytic deposit dissolved in HNO_3 and determined by KCN=1.04%.
	2.	1.00		
2...	1.	0.37	0.43	
	2.	0.42		
3...	1.	0.65	0.73	Electrolytic deposit by KCN =0.73%.
	2.	0.67		
4...		0.92	0.91	Electrolytic deposit by KCN =0.95%.
5...		1.15	1.13	Electrolytic deposit by KCN =1.14%.
6...		0.60	0.68	Electrolytic deposit dissolved in HNO_3 and determined colorimetrically=0.65%.
7...		1.35	1.44	Electrolytic deposit by color =1.40%.
8...		1.07	1.13	Electrolytic deposit by color =1.15%.
9...		0.99	1.04	Electrolytic deposit by color =1.00%.

Green tints generally result in a low reading. Organic matter is the principal cause; but considerable percentages of arsenic will also interfere, and produce tints which it is impossible to compare. Small percentages of arsenic have no effect.

The advantages of the above method over the usual method of using sets of standard colors are:

1. In a small office space is valuable, and a set of standard colors will take up room which may be used for something else.
2. An exact match is made with each assay.
3. The assays are read from a fresh standard, and not from a bottle which may have been made up months before.

It was found that Mr. G. L. Heath's bottle was expensive, and easily broken. A bottle which is inexpensive, stands the wear of the assay office of a works, and, at the same time, gives excellent results, is a square bottle, No. 5675 of Eimer & Amend's catalogue, 2 inches in diameter, and 4¾ inches high from bottom to neck, upon which any required markings for contained volumes can be readily etched, according to the desire of the assayer.

The results tabulated above were obtained with this bottle.

---

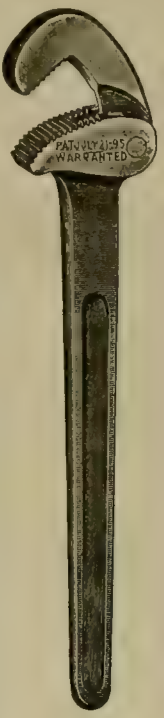
*Canadian Meeting, August, 1900, American Institute of Mining Engineers.

From the Sierra to the Sea.

The characteristic Sierra view caught in the accompanying photographic picture suggests the great mountain barrier along California's eastern border and the service of the Sierra in the arrest of eastward cloud movements from the Pacific and reception of the vast volumes of water in the deep snowfalls on the high altitudes. This water favors the forest growths of the mountains, which in turn conserve the water for the summer flow of the rivers. The picture of the rocky rift in the Sierra is of a scene in Tehama county, showing a stream-flow, which is employed in generation of electricity for transmission to the valley below for light and power, suggesting the new-found relation of the torrents of the Sierra Nevada to the industrial activity of the State. All the way from this northern point in Tehama county southward for 500 miles or more the falling waters of the mountains are being used for electric service, and the subtle current is conducted scores of miles to do work in valley and coast regions, a new phase of development, beginning to be appreciated and utilized. The water itself is a great agency in the development of the State, which has never yet been conserved and employed except in a small, fractional part of its possibility.

A Scene in the California Sierras—A Source of Light and Power.

An Effective Pipe Wrench.



Manufacturers and mechanics, having occasion to use the pipe wrench, are interested in a late development of that tool, as illustrated herewith. The Johnston pipe wrench is intended to do away with objectionable features of some other wrenches, such as slipping, crushing the pipe and getting out of repair. The pipe illustrated can not slip, for the greater the pressure on the lever the greater becomes the grip upon the pipe. This grip is effected in such a manner as to keep from crushing or denting the pipe, and the tool can not jam or wedge past. As soon as the lever arm is lifted, the jaw is automatically loosened and the wrench easily removed from the pipe. It needs no adjusting when fitting to a pipe, the movement of the lever alone causing the jaws to grip fast. There are but three parts—lever and head, movable jaw and pin. These are made of crucible steel, drop-forged, and are interchangeable. The manufacturer has agreed to replace, free of cost, any parts of these tools that break under fair usage.

This wrench is made in three sizes, having levers 12, 16 and 24 inches in length, respectively, and these will fit pipes or bars ranging from ⅛ inch to 2½ inches. The wrench is manufactured by Wm. B. Volger, 88 Chambers St., New York City. They may be obtained of the Mine & Smelter Supply Co. of Salt Lake City and Denver. They are adapted for mining work, and are in use in Arizona, Mexico, Pennsylvania and Alabama.

The big asphalt combine is known as the National Asphalt Co. of America; capital stock, $22,000,000. The company will take in all the Barber properties, the Asphalt Co. of America, the Pennsylvania Asphalt Co., the Gilson Asphaltum Co., which controls the Gilson Asphaltum Co. of St. Louis, owning mines in Utah, and the Gilsonite Roofing & Paving Co. of St. Louis. It will also combine the New Jersey-Mexican Asphaltum Co., which has two leases of asphalt properties near Tuxpan, Mexico; Manhattan Trap Rock Co., which owns lands and appurtenances at Upper Nyack, Rockland county, N. Y.; titles to three asphalt deposits on the east shore of Lake Maracaibo, in Venezuela, known as El Mene, Temblador and Laguinillas.

Constitutionally Affirmed.

To THE EDITOR:—On page 91 of your issue of July 28 you assert as follows:

> There is no law nor statutory provision in California or any other State against hydraulic mining. In California a decree of a court and injunctions under that decree have interfered with hydraulic mining operations, but Congress some years ago passed a law under which hydraulic mining may be carried on. That law, known as the Caminetti Act, has been declared to be constitutional, in a case where its constitutionality was attacked by a California hydraulic mining company at North Bloomfield, Cal.

Now, I would like to know when, where and by whom the "Caminetti Act" mentioned above was ever "declared to be constitutional," and would also like some information about the facts in the North Bloomfield case. S.

Sacramento, Cal., Aug. 31.

June 8, 1897, at Los Angeles, Cal., by Judge Ross of the U. S. District Court. The North Bloomfield Co. denied the constitutional right of the Act in question to apply to its workings: Judge Ross affirmed its constitutionality, and enjoined the mine.

The circumstances in detail were as follows:

The U. S. District Attorney, representing the Government, brought suit against the North Bloomfield G. M. Co., praying that a writ of injunction be issued, prohibiting the company from continuing its hydraulic mining operations at Humbug creek, a stream within the territory drained by the Sacramento and San Joaquin river system, Cal., as set forth in the Caminetti Act.

On June 8th, '97, Judge Ross granted the writ as sought for, in the U. S. District Court. In the complaint filed by the District Attorney, it was set forth that the mining company failed to file with the Debris Commission a petition for a writ to carry on hydraulic mining, and having failed to file such petition continued its operations of hydraulic mining. Further than this, the complainant alleged, proper provisions had not been taken for the impounding of debris, and that such debris as was washed down operated to impede navigation in the rivers, heretofore deemed navigable, by settling on the bottom and raising bars.

In reply the mining company denied the allegation that the debris from the plant impeded navigation, but insisted that such as escaped their impounding dam was of a flocculent nature and floated lightly on the water, being ultimately carried out to sea. With respect to the failure of the company to file a petition with the Debris Commission for a permit to carry on hydraulic mining, it was contended that inasmuch as no impediment to navigation was created as a result of the mining operation, therefore there was no necessity to file such a petition. Furthermore, the Bloomfield Company denied the right of Congress to place restrictions upon the hydraulic mining industry, such as established by the Caminetti law.

In his opinion Judge Ross reviewed the entire Act creating the Debris Commission, and, commenting upon it, said:

"From these provisions, and there is nothing in the Act to the contrary, it seems quite clear to me that its real intent and meaning is to prohibit and make unlawful any and all hydraulic mining in the territory drained by the Sacramento and San Joaquin river systems, in the State of California, directly or indirectly injuring the navigability of said river systems, or to the lands adjacent thereto; and to permit it in all cases where the work can be prosecuted without such injury to the navigability of the said river systems or to the land adjacent thereto.

"That in order to properly determine the facts upon which the legislative will is to act, a skillful commission is created, whose duty it is to ascertain and to determine what will, or will not, cause the prohibited injury, and to prescribe the character of the impounding works and the extent to which hydraulic mining in the territory described may be carried on without such injury.

"To give effect to this manifest purpose Congress in effect enacted that until the commission should find that such mining can be carried on without causing the prohibited injury all hydraulic mining within the territory drained by the Sacramento and San Joaquin river systems is unlawful; for by Sec. 9 it is in terms declared that any person or corporation owning mining ground in that territory, 'which it is desired to work by the hydraulic process, must file with said commission a verified petition setting forth such facts as will comply with the law and the rules prescribed by said commission.'"

Then followed a number of citations from various cases tending to show the power of Congress to determine what may or may not be obstructions to navigation. The case of the Brooklyn bridge was the most important one recalled by Judge Ross. In that instance it was positively held that only under certain specified conditions, such as would not blockade or interfere with traffic on the river, could the bridge be built. Therefore concluded Judge Ross:

"So here Congress has created a commission under the direction of the Secretary of War and the supervision of the Chief Engineers of the Army to ascertain and determine whether the various hydraulic mines within the territory drained by the San Joaquin and Sacramento river systems can be operated by means of impounding reservoirs and other works without injury to those navigable rivers; and, if so, the Acts of Congress permit them to be operated in such a prescribed way as will prevent any such injury.

"Until the matters of fact committed to the commission have been ascertained, and the extent and methods of the works so prescribed, the Act of Congress prohibits the operation of any mine by the hydraulic process within the territory drained by the San Joaquin and Sacramento river systems from which any debris matter flows into those waters.

"This, in my opinion, is the true construction of the Act, and to it, as thus construed, I see no constitutional objection. * * * A decree will be entered for complainant as prayed for."

The Black Range District, New Mexico.

Town of Chloride, Sierra Co., New Mexico, Foothills of Black Range.

The Black Range district is west of the terminus of the Magdalena branch of the railroad, and is in the foothills on the east side and near the north end of the Black Range. The formation is porphyritic, principally andesite, and occasionally belts of trachyte show themselves running parallel with the veins. Limestone occurs in isolated places.

Every foot of the lode from Wild Horse creek to Dry creek—8 miles—is marked by croppings. The vein is located the entire distance. The mineral belt is from 4 to 8 miles wide. The accompanying illustration of Chloride serves to give a general idea of the country.

New discoveries in the Black Range are attracting attention and the country is full of prospectors. F. L. Buchanan, Supt. El Dorado mine, Hillsboro, thinks that the ore is principally of a concentrating character, and that deep mining will be necessary to bring them into profitable operation. "I can show claims in the Black Range that are literally cut up with shallow shafts and open cuts from one end to the other. All of these openings and cuts show the vein plainly, and it is a wonder that the prospectors did not go down when the vein was once found, for the time and money scattered in useless surface work would have developed the vein and made a mine of the property. No man can hope to sell a mine for a fair price until he has shown what it contains at a depth of 100 feet from the surface. Every foot less decreases the price that can be obtained for the property, even if it is a proposition of more than ordinary merit. There are two lessons to be learned in the Black Range. One is that deep mining will seldom fail to find the values of very high grade, and the other is that nine-tenths of all the ores are concentrating ores. One can mine and concentrate three tons of ore for what it will cost to hand sort one ton to make it high-grade shipping ore. Hand sorting is an imperfect, slow and expensive method of concentration, which, with the improved machines now in use, can be done better, quicker and at from one-third to one-fourth the cost."

Men and supplies have been going in throughout all of 1900, and an extension of the branch line of railway is now projected.

A New Enterprise.

The Risdon Iron Works of San Francisco have recently purchased the property of the old Pacific Rolling Mill Co. in the Potrero, San Francisco. This property consists of some thirty-two acres of ground, immediately adjoining the Union Iron Works, and has a deep water frontage of over 1700 feet. Application has been made to the Board of State Harbor Commissioners for a site for a new dry dock. This dry dock will be 500 feet in length by 100 feet in width. New wharves are now in course of construction. Several new steel frame buildings are contemplated, and large orders covering the structural materials for the following buildings have recently been placed:

Machine shop—length, 308 feet; width, 100 feet. Total lift over main floor, 45 feet.

Boiler shop—length, 140 feet; width, 180 feet. Total lift over main floor, 40 feet.

Machine and ship blacksmith shop—length, 300 feet; width, 60 feet.

Foundry—length, 177 feet; width, 160 feet.

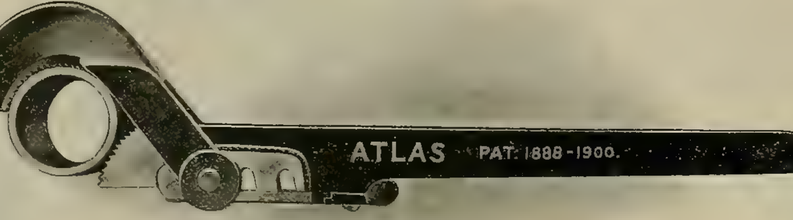
Ship joiner shop—length, 140 feet; width, 81 feet.

The machine shop will be equipped with four electric traveling cranes of the following capacities: One 50-ton, one 20-ton, one 15-ton and one 10-ton. Each crane will be of the most modern type and equipped with five-ton auxiliary hoists. The boiler-shop crane equipment will consist of one 60-ton, one 20-ton and one 10-ton electric traveling crane, each equipped with five-ton auxiliary hoists. The foundry crane equipment will consist of one 30-ton and one 20-ton electric traveling crane with five-ton auxiliary hoists. The ship blacksmith shop will be equipped with eight jib cranes of five and ten tons capacity each.

The machinery equipment throughout will consist only of the most modern tools. The entire plant, with the exception of the steam hammers in blacksmith shop, will be operated by electricity, and contracts have recently been placed with the Independent Electric Light & Power Co. of San Francisco to furnish power for this plant. Direct current will be used for the cranes and an alternating current for the machinery equipment. Separate motors will be installed in each department. The cost of electric power for operation of this plant for the first year will amount to over $30,000.

Risdon representatives are now in Washington preparing estimates for the new battleships for the United States Navy, and will be prepared to bid on at least two of the new vessels.

The Atlas Pipe Wrench.



The accompanying illustration is reproduced from a photograph of an 18-inch Atlas pipe wrench in operation on a 2-inch pipe, and demonstrates why it does not crush the pipe. From an examination of the illustration it will be readily seen that the teeth grip the pipe at an angle and the gripping point is in advance of the handle, showing that in screwing a pipe one pushes it ahead, and does not dig into the pipe and drag it as in some pipe wrenches; therefore it is not crushed. For the same reason the Atlas pipe wrench can not lock on the pipe as the gripping point; being in advance of the handle, it is impossible for it to lock.

The wrench is designed to be just as effective when fully extended as when used on the smaller size of pipe. The movable jaw, as represented in the illustration, is in slot marked No. 3 for the larger sizes; by shifting to slot marked No. 2 the wrench can be used on the medium sizes of pipe; and, shifted to slot marked No. 1, can be used on the smaller sizes. For examples, on the 18-inch wrench, slot No. 1 for ¼ to 1-inch pipe, slot No. 2 for 1¼ to 1½-inch pipe, slot No. 3 for 2-inch pipe. The movable jaw, as the illustration also shows, is not a screw jaw, and is designed to have no weak parts. There are no nuts on the wrench to jam and no delicate parts to get out of order or break. It is made of special wrench steel, drop-forged, every wrench tested. The 24-inch wrench will take ½-inch larger pipe than other wrenches, and 36-inch wrench 1-inch larger pipe. A set of four wrenches will handle all sizes from ⅛-inch wire to 4½-inch pipe. The 24-inch and 36-inch have inserted jaws in handle.

It is made by the Atlas Pipe Wrench Co., Flood Bldg., San Francisco; Eastern office, 121 Liberty St., New York.

MINING SUMMARY.

ARIZONA.

COCHISE COUNTY.

Laub City says in the Dos Cabezas Con. mines a blind ledge 60 feet wide runs 25% copper, $3.50 per ton silver and $2.50 per ton gold. Water is struck in the Casey mines. The scarcity of water has been a block to their development.

GRAHAM COUNTY.

A meeting of the shareholders of the Arizona Copper Co., Limited, was held in Edinburgh, Scotland, on the 4th inst., to hear a statement from Supt. Colquhoun. The chairman said the meeting was held in accordance with a promise made some time ago that they should have an opportunity of meeting Supt. Colquhoun while he was in that country. Supt. Colquhoun and other employes of the company at Clifton had purchased largely of the shares of the company, but were surprised that while they were successfully working and making lots of money for the shareholders, the latter were giving so much attention to litigation, which they in Arizona did not see was to be of any profit. After describing in detail the various mines and works at Clifton, Supt. Colquhoun said that during the past four years the development and increase of plant had revolutionized their business methods. He had solved the problem of making low-grade ores a valuable asset, and they had found they could make money from them. Their plant had been strained to the utmost, and had gone more and more out of date. During the present half year they had not been doing nearly as well as six months ago, and they did not do as well six months ago as the previous six months. They had been suffering from a tremendous congestion of business, but they had relieved the situation considerably. They should have to bear on the problem the best appliances that now could be had. The important thing was not now what it cost, but could they make copper when copper went back in price to its old value? They had no right to expect that they, copper men alone, should benefit by the prosperity which everyone enjoyed all over the world at the present time. Could they, when these hard times came again, from these 4% ores, make copper at as low a price as they did formerly? To that he answered, yes; provided they made the improvements in the works to which he was about to refer. They had decided to erect a 200-ton concentrating plant, and they would be able to raise their output to somewhat over 13,000 tons of copper per annum. They had decided to expend £150,000 in rebuilding their smelting plant, their concentrating plant, in increasing the capacity of their railway and their Bessemer plant, and so put them in a condition they required to be in to handle these low-grade ores. A vote of thanks was tendered Supt. Colquhoun for his services to the company.

MOJAVE COUNTY.

The property of Maguire Bros., 4 miles south of Kingman, is bought by Averel & Huntington of San Francisco.

The Tiptop and Salvador mining claims near El Dorado Canyon have been bonded to A. P. Johnson of Denver for $15,000.

YAVAPAI COUNTY.

Supt. L. A. Davies of the Reliance G. M. Co. will operate the old Aztec mine, one of the group which belonged to the late Sun Dance M. Co. The new company is developing the Silver Trail and Thorne and have men employed. The mill on that property is of thirty-five stamps.

YUMA COUNTY.

The King of Arizona mine has shipped to Tucson a bar of gold weighing 160 pounds, valued at $35,000.

CALIFORNIA.

BUTTE COUNTY.

Twenty men are laying pipe from the Cherokee Co.'s ditch to the Banner ditch.

Mercury: The Banner mine is disposing of all its electrical machinery except the lighting plant, and will operate by the direct application of water power. The motors are being shipped to San Francisco.

CALAVERAS COUNTY.

Near San Andreas the Lucky Boy or Waters mine is to be opened. The company will sink a shaft 6x11 feet and will erect machinery of sufficient capacity go down 1500 feet.

At the Ozark mine a two-compartment shaft is being sunk.

At the Oriole mine it is the intention to sink 600 feet.

G. S. Holmes, who, with C. Coram of Boston, bought the Calaveras group of mines for $75,000, is at the property to start the mill.

EL DORADO COUNTY.

At the Ribbon Rock mine the shaft is down over 200 feet. Three hundred feet of tunnel was run. The shaft will be sunk 500 feet.

A strike of gravel is reported in the west ledge at the Larkin mine. Sinking will be continued to a depth of 800 feet.

At the Cambrian mine, near Granite Hill, a new water power hoist is being built.

Development work is being done on the 200 and 300-foot levels at the Grand Victory.

KERN COUNTY.

The Mammoth mine of Kernville, owned by Mr. Russell of Los Angeles, who has a 10-stamp mill, is to have an increase to forty and a tramway, the machinery to be run by electric power.

Randsburg Miner: The Buckboard mine has had sixty tons of ore crushed at the Red Dog mill, which produced a gold brick worth $1000.——The California Borax Works will resume.

MADERA COUNTY.

The Mariposan says "the Gambetta mine at Grub Gulch has been closed down and the pumps pulled out."

MARIPOSA COUNTY.

M. C. Randolph, representing the Benvenuta M. Co., has a bond on the Virginia mine, Coulterville.

The Columbia Con. G. M. Co. has bought for $6000 the Lafayette, Eureka, Blackhorse and Alba claims, near Coulterville.

MONO COUNTY.

The Par Value M. Co. at the Arnot mine, Green Creek, on the 17th increased the capital stock to $72,000.

NEVADA COUNTY.

A new 10-stamp mill is being placed at the California mine, Graniteville.

Work has begun at the Franklin mine, Willow Valley.

A new 5-stamp mill will be put in at the Le Compton mine, Willow Valley. J. J. Ott, owner of the mine, will also put in hoisting works and pump. The shaft on the Le Compton is 300 feet deep. It will be sunk to a depth of 800 feet.

J. Bonney has run a 700-foot tunnel on the Rainbow mine, in God's Country, and found a shoot of ore 100 feet in length, average thickness 18 inches.

The Diana and Columbus mines, near the Maryland, are to have a new hoist and pump. The ledge runs parallel with the north line of the old Eureka mine.

Dana Harmon, Supt. Gaston Ridge quartz mine, will increase the number of stamps at the mill from twenty to thirty.

H. L. Body will have the new 20-stamp mill at the Cadmus mine running next week.

The Moore G. S. Co. of San Francisco has bonded 200 acres gravel ground at Scott's Flat.

The Hudson M. & M. Co. has levied an assessment of 2 cents per share, delinquent October 22.

PLACER COUNTY.

The Morning Star mine of Iowa Hill is again a dividend producer, a $3 dividend having been declared.

Sentinel: The Alameda quartz mine will raise the retaining dam 4 feet. The mine consists of a ledge from 50 to 100 feet in width. The surface of the ledge on the steep mountain is decomposed and is worked by a piping and sluicing process.

PLUMAS COUNTY.

W. P. Hammond is at Spanish Ranch boring to decide if dredgers would be profitable.

SAN BERNARDINO COUNTY.

(Special Correspondence).—The Bagdad mine, 7 miles south of Ludlow, has a high grade and apparently extensive ore body in the 200-foot level, which is being explored; C. Grant is Supt.

Ludlow, Sept. 18.

SAN DIEGO COUNTY.

Filings on 16,000 acres of oil land on the desert in the Carriso creek section have been recorded by Z. B. Stuart of San Bernardino—100 claims of 160 acres each, and all the notices signed by Stuart as locator.

SHASTA COUNTY.

The Mountain Copper Co. paid into the county treasury for 1899 $26,000. For the year 1900 the assessed valuation is $1,750,000, on which it will pay $35,000.

SISKIYOU COUNTY.

F. Beaudry of South Fork of Scott river says he wants at least fifty men to do the necessary improvement work on the properties recently purchased, to shape them for handling by the time the water season started. A ditch and flume will be built.

TEHAMA COUNTY.

Red Bluff reports that workmen on the Cone ranch have struck gold in Antelope valley.

TRINITY COUNTY.

U. G. Day, Supt. Enterprise M. Co., East Fork, says the ledge on the lower level of the Lone Jack mine has been struck by tunnel and is 3 feet in width. It will go $15 a ton.

The new tunnel of the Brown Bear mine at Deadwood will cut the ore body.

Near Dedrick, in the lowest level of the Globe mine, drifting on a 4-foot ledge goes on. The 5-stamp mill is running.

At the Ralston mine G. L. Bailey has fifteen men employed.

TULARE COUNTY.

C. C. Harker, president Western Carbonic Acid Gas Co., owner of the magnesite property east of Porterville, will put in a furnace for roasting the ore. The deposit is 90% pure. When roasted it makes an oxide of magnesia and gives off carbonic acid gas, which is liquefied, transferred to steel and shipped for carbonating mineral waters, refrigerating purposes, etc. The oxide of magnesia is used in the paper mills, after being treated with sulphur gas, making sulphide of magnesia, used, after being pulverized to a fine powder, to take out the resinous matter in the wood pulp used in the manufacture of paper. The oxide is also used for the manufacture of magnesia bricks. The company also uses it for making light carbonate of magnesia. A demand is made for it by the powder companies for their high-grade powder, it acting as an absorbent of the nitro-glycerine.

TUOLUMNE COUNTY.

The Dutch mine has electric power from the Tuolumne Co. to keep the compressor going. Drifting south on the 1000 level and north on the 1200 goes on. Sinking in the shaft below the 1200 level is resumed.

Near Stent the Santa Ysabel mine has been unwatered and will be kept so. Nothing else will be done until the rains come.

The Jumper mill is closed down owing to scarcity of water. Forty-five men were drafted in consequence. About fifty are still at work.

Near Columbia C. H. Knos has uncovered ore in the Riverside mine.

The new chlorination plant at the Shawmut mine is progressing.

Independent: At the App mine it is the intention to put in an additional forty stamps at the mill.——The Confidence mine and mill will be running next month.

VENTURA COUNTY.

The Union Oil Co. is drilling a well in Adams canyon, which "it intends to put down 4000 feet if necessary." It is starting with a 16-inch hole.

COLORADO.

CHAFFEE COUNTY.

Near Buena Vista the two tunnel enterprises projected are to cut the old Cornucopia on Mt. Princeton 1000 feet lower.

B. F. Morley is arranging to run a tunnel from a point near the Colorado & Southern Railroad to tap the Mary Murphy vein at greater depth.

In Turret district N. Esperson has been appointed Supt. Queen City, and will also have charge of the work on the Gold Bug. The Anaconda and Vivandiere will resume.

CLEAR CREEK COUNTY.

The Monarch M., M., T., T. & P. Co. has started its tunnel. Manager McClelland proposes to cut the Freeland vein, which will be reached in about 5000 feet, and, when encountered, will cut that vein at a depth of 2500 feet on the dip, from 1200 to 1400 feet deeper than at present.

EL PASO COUNTY.

The Portland G. M. Co. is surveying the site of the new Portland mill at Colorado City; on May 1, 1901, the plant will be in operation. The mill is to be entirely of steel; it is expected to permit a saving of $30,000 a month on treatment charges.

GILPIN COUNTY.

Register-Call: At Apex the management of the Sherman tunnel are putting on more men and new machinery.——During August there were shipped from the Blackhawk depot of the Colorado & Southern Railroad 301 cars of ore, aggregating 5568 tons, representing the shipments of smelting ore, tailings and concentrates, to Denver and other smelters, and crude ore to outside points for treatment. Compared with the previous month's shipments, August shows an increase of 1146 tons—a gain of 25%. The shipments for the first week of September were 80 cars, 1480 tons.

GUNNISON COUNTY.

The Forest Hill Con. M. Co. and the Canton & Pittsburg M. Co. are extensively operating mining property on Forest hill, Tin Cup district; E. Stitz, Supt. The two companies own thirty-one claims, over 300 acres.

A. H. Elftman says: "The ore in the Tourist vein carries sulphides of iron, copper and lead, carrying gold and silver, and usually associated with a quartz gangue. From the ore so far found in place and the abundant float it appears that there will be rich pay streaks, composed entirely of the sulphides, besides large bodies of quartz ore carrying these sulphides, more or less evenly distributed. This latter will form the low-grade or concentrating ore. From the ore on the dump and that taken from the bottom of the Tourist shaft it is shown that this ore is a good concentrating material, running about $10 per ton, according to assays made, and concentrates about ten tons of ore into one ton of concentrates."

HINSDALE COUNTY.

Thirteen miles above Lake City the Henson Creek Lead Mines Co. own six claims on Henson creek, and will erect necessary buildings and develop under the management of Supt. Adams.

OURAY COUNTY.

(Special Correspondence).—The Camp Bird mill of forty stamps, twenty Frue vanners and four Wilfley tables, which crushes an average of 138 tons of ore per day, has operated every day during the past year, with the exception of a close-down on Christmas and on the Fourth of July—both cases being purely a holiday affair. From 61% to 62% of the mill saving is effected by amalgamation, the balance being saved in the concentrates. It is figured that at least 90% of all the values in the ore is extracted by the two processes.

There are various devices about the mill which have been designed by those in charge, as the outgrowth of the requirements of everyday practice. One is the system of quick-traps below the plates for the purpose of arresting any amalgam which might otherwise escape. Another consists of gravity and hydraulic sizers by which the material passing from the plates is classified for the different concentrating tables. The vanners are ranged in two rows, the first taking the material from the plates through the system of sizers; the tailings from the first row are elevated to another system of sizers, or classifiers, from which they pass down to the second row of vanners. The entire concentrate product is elevated and carried to a separate building and there dumped into V-shaped bins, containing coils of steam pipe, connected with the boilers, and by this arrangement the concentrates are slowly dried, after which they are dropped down through chutes to the floor where they are sacked for shipment. It is pointed out that this method of drying avoids the loss which may take place when the concentrates are dried rapidly by fire heat, which is often sufficient to produce fumes and a loss therein.

For the purpose of effecting a saving of values in the concentrator tailings, a cyanide plant has been erected, which will doubtless be in operation within thirty days. In this plant there are virtually four floors. On the top floor are the solution storage and mixing tanks; on the third floor are the leaching tanks which first receive the pulp and wherein a weak solution of cyanide is applied; from these the material passes to tanks immediately beneath on the second floor, where it is subjected to the strong solution. From the last named tank the refuse is sluiced down to oblong tanks on the first floor, where we also find the zinc precipitating boxes. In the basement are the tanks into which are drawn the exhaust solution, and where it is brought up to the required strength for use again. Here is also the bullion furnace.

The tanks are all of steel, the main leaching tank being 22 feet diameter by 6 feet depth. The plant will have a capacity of 100 tons per day; 600 tons of material will be constantly in course of treatment through the plant. It is estimated by Supt. W. H. Coates that the concentrate tailings, resulting from present capacity of operating, will be equal to the capacity of the cyanide department, although there is a large tonnage of tailings impounded on the premises.

The main mill building is being extended to make room for forty additional stamps, twenty of which to be put in this fall and the others next spring. This will also require additional concentrators. At this mill I observe the use of a new stamp die, made in two sections, with a flange on lower section to hold the upper part in place. The design of the die is that the upper section may wear out and be replaced without replacing the entire piece. It is claimed that it works satisfactorily.

The 2-mile tramway line has forty-six buckets, and from the 11,500 feet altitude at the mine down to the mill is a descent of 1500 feet. The Camp Bird ores are a sulphide of iron, carrying gold values in the main, though much of the gold is in telluride form. The mill is operated by water power part of the season and then by steam power. The three compressors at the mine are run by an electric motor, driven by transmitted power from Ames, a distance of 28 miles. WASCOTT.

Camp Bird, Sept. 7.

(Special Correspondence).—The Silver Link mine, situate in Poughkeepsie gulch, four miles from Ouray, is being put in condition to produce by its owners and is in charge of F. O. Seabury. This property was considerable of a producer about ten years ago, yielding copper in a bornite and chalcopyrite ore. For several months past the work has been directed to cleaning out and retimbering the old workings and it is expected that the mine will be in position to ship copper ore within a few weeks.

Ouray, Sept. 7.

(Special Correspondence).—The Bachelor mine, near Ouray, is producing nearly 5000 tons of ore per month. The high-grade smelting ore, amounting to about 150 tons per month, runs from 180 to 200 ounces in silver, with small values in gold. The bulk of the output, classified as mill ore, averages about forty-five ounces silver. The highest grade milled runs about 100 ounces and the lowest about ten ounces silver. The mill, in charge of Supt. C. E. Fryberger, is strictly a concentrator and is an illustration of how the details of concentration are usually worked out according to the needs that develop as the ore handled is experimented with. In this case the ore passes through an 11x15 inch Dodge crusher, thence elevated to a storage bin, below which is an automatic device which feeds the ore to a revolving four-mesh screen, the coarse from the latter passing to a set of 14x27-inch four-mesh rolls; that which passes the screen goes to a set of 6x30-inch, twenty-mesh, high-speed rolls. The product from the twenty-mesh rolls is elevated to different sets of wet screens, the coarse screenings passing to three Bartlett tables; and the fine to two other Bartletts and one Cammett table. The tailings from the coarse tables are elevated to and reground by a set of 6x30-inch rolls, the product passing through a wet twenty-mesh screen and thence to the group of fine tables. The coarse concentrates carry about 30% lead, high values in silver; the fine carries about 10% lead and nearly the same proportion of silver as the coarse. The crude ore contains about 6% of zinc, a pretty thorough separation of which is made from the silver and lead by the tables, the zinc passing to the tailings. The final tailings from all the tables are then carried to hydraulic gravity sizers. by which the waste material passes down through the bottom; the slimes overflowing and running to canvas tables below. Over each set of canvas tables is a second hydraulic sizer which receives the slimes at the top and fresh water from below, which causes the slimes to overflow at the top though spouts and thence over the tables. The saving thus effected on slime tables amounts to considerable. It is estimated that the entire mill saving is about 80%. The concentrates contain a considerable amount of gray copper in connection with iron.

The ores from the Bachelor are brought out through a 700-foot crosscut tunnel, containing double track for ore cars, a pipe line for compressed air and a steam pipe from the boilers at the tunnel entrance to the large hoisting engine at the breast of the tunnel, where it taps the vein. At this point a 7x11-foot shaft sinks 300-feet by the side of the vein, there being drifts from the shaft on the vein at 100 and 200-foot stations. From the tunnel level an upraise connects with the third level 260 feet above, where there is 1300 feet of drifting on the vein; from the third level a 90-foot upraise connects with the second level, where there is also a large amount of drifting. The vein is pretty well stoped out between the second and third levels. Most of the present tonnage comes upon the tunnel level and the one above it, or the third.

The vein, which ranges from 8 inches to 8 feet wide, follows the trend of a great porphyry dyke. The formation is such as requires very little timbering. The shaft mentioned goes beyond water level and it requires a sinking pump. It is sunk on the line between the Bachelor and Khedive grounds. The tunnel mentioned belongs to the Khedive property. Geo. R. Hurlburt, who owns the Khedive, is president of the Bachelor Co.; so that the two mines, which endline with each other, work in harmony. The Khedive is at present doing development work. Tim Marrion is Supt. of the Bachelor mine.

The Caliope and Dexter groups are now owned by the Caliope-Dexter M. Co., of which C. H. Nix is manager and S. R. Hopkins secretary. The company is sinking a shaft at a point between the Caliope and Dexter veins, having already sunk 150 feet and are to sink 150 feet deeper. Crosscuts are being made from the shaft to the two veins. It is said the purpose is to build a tramway from the mine to the river and erect a mill at the latter place.

Ouray, Sept. 8. WASCOTT.

PITKIN COUNTY.

At Aspen unwatering goes on to recover the thirteenth level in the Mollie Gibson and the tenth level in the A. J. mine.

SAN JUAN COUNTY.

(Special Correspondence). — The Hercules Con. M. Co., under the management of Thos. H. Kane, is operating on the Silverton side of Sultan mountain, on a group of thirty-two claims. The workings consist of an upper tunnel which crosscuts the formation, and is now in 1700 feet. About 600 feet below it is a lower crosscut tunnel which penetrates the mountain a distance of 2400 feet. The two tunnels cut five parallel veins, which stand nearly vertical, and on which a large amount of drifting has been done, the upper and lower tunnel workings being connected. From the upper tunnel entrance a tramcar line, 1000 feet long, carries the ore down to the mill at the foot of the mountain. The ore passes through crushers and rolls, and from the latter are elevated to revolving screens, from which the different sizes pass to a system of jigs. About 65% of the values are saved in the jig product; the tailings from the jigs pass down through automatic feeders to four batteries of stamps, below which are amalgamating plates, the tailings flowing down to Wilfley tables. The mill is operated by two low-case Leffel water wheels, propelled by water from a 3400-foot flume from Mineral creek. The mill, which has a capacity of 120 tons, is just starting up. The ores consist of a copper and iron sulphide, carrying values in gold, silver and lead.

The Iowa mill, of which R. J. McCartney is superintendent, is handling 160 tons of ore per day, which is carried to the mill from the Iowa mine in Silver Lake basin, over a 1½-mile tramway. The ore goes through crushers and rolls, from which it is elevated to screens, passing from the latter to jigs of 2 to 8-mesh. The jig product contains about 70% of the values saved. The jig tailings are run through Huntington mills, thence over concentrators—five Wilfleys and one Cammett. A Chilian mill is being put in to do a work similar to that of the Huntingtons; also four new Cammett tables are to be put in. A system of hydraulic sizers, designed by Manager Watson of the Iowa, are to be put in use over the concentrators. The table tailings are carried to a system of canvas tables, which are in charge of N. H. Crane, who looks after this part of the product on a percentage of values saved. Supt. McCartney has designed and put into use a riffle attachment to the concentrators, which he believes effects an important saving. He is also using an automatic sampler for the table tailings and one of different design for the crude ore that passes the revolving screens—both of his own design. The Iowa concentrates are transported from the mill to the railroad track, a distance of 1 mile, where there are shipping bins. The Iowa mill is operated by steam. WASCOTT.

Silverton, Sept. 8.

(Special Correspondence).—The manager of the Silver Lake mines has commenced the construction of a new mill at the railroad, where the ore bins and lower terminal of the tramway line are located. This point is about 2½ miles from the mines and approximately 2000 feet lower. A branch tramway line has been erected from the mouth of the Unity tunnel, connecting with the central terminal on the main line, and is 4300 feet long, the highest tower on this branch being 107 feet high. This new line was constructed by Wm. Dusedau of New York. The Unity tunnel starts on the western slope of the mountain, proceeds easterly through the mountain, cutting about 400 feet under the main Silver Lake workings, with which it connects by an underground shaft. The tunnel is reported to be about 2 miles in length. No doubt all ore below the level of the old workings will be passed down to the Unity tunnel and thence down to the new mill, rather than hoisting it to the upper levels and sending it to the old mill. It is understood that the old mill, which is up in Silver Lake basin, will still be operated on certain ores even after the completion of the new mill.

A new steam power plant, belonging to the Silver Lake property, has been built on the Animas, which is designed to operate additional generators for electric power.

Silverton, Sept. 11.

(Special Correspondence).—The Elmyra M. & M. Co. are operating the Silver Ledge mine and mill, near Chattanooga, producing a lead and iron ore, of which they ship about one car per day.

Chattanooga, Sept. 12.

SAN MIGUEL COUNTY.

(Special Correspondence). — The Four Metals M. Co., composed of Boston, St. Louis and Pueblo parties, is operating the Palmyra mine, in Turkey Creek basin, between Telluride and Ophir. The holdings comprise about seventy acres and developments consist of a tunnel 1500 feet long, which goes in on the vein, with considerable amount of stoping above the tunnel level. The ore is a partially oxidized quartz, carrying gold, silver, copper and lead values, a considerable tonnage of which is exposed in the workings and piled up on the dump. For some time during the summer four cars of ore a week were shipped to the smelters, which, it is asserted, averaged $40 per ton. A tramway line is being erected from the mine to the foot of the mountain, where a mill will doubtless be erected next year.

Telluride, Sept. 12.

SUMMIT COUNTY.

T. Harris has raised the Risdon dredger recently sunk on the North American Co.'s property on the Swan, and it is in condition to run.

TELLER COUNTY.

The Modoc G. M. Co. will sink a 1000-foot shaft on the Ocean View claim.

At Cripple Creek the Independence Con. M. Co. will sink the main working shaft 300 feet, which will make the total depth 1050 feet.

It is expected that the work of sinking in the main shaft of the Golden Cycle will be completed about the first of the coming month unless the water should get worse. Quite a flow of water is coming and there is some apprehension concerning it.

The St. Patrick mine in Victor will begin operations next month in charge of J. McConneghy.

The Zenobia G. M. Co. has decided to sell the Zenobia claim for $100,000.

The La Bella Co. has in operation twenty-five electric hoists, and are supplying the air to operate the thirty-three air drills.

The shaft on the Gold Coin M. & L. Co. is down 1025 feet.

Work in the Moon-Anchor property on Bull hill is discontinued pending the special meeting of the stockholders on the 24th, when the proposition to increase the capitalization from $600,000 to $1,250,000 will be voted upon.

At Denver on the 18th a suit was filed by P. Rogers and others to enjoin the proposed sale of the Zenobia mine at Cripple Creek. The complaint alleges that W. S. Stratton has called a meeting to ratify the sale of the mine to W. C. Currie, agent for Stratton, for $100,000, when it is said to be worth $250,000.

IDAHO.

ELMORE COUNTY.

The properties at Atlanta belonging to the Atlanta G. & S. Con. Mines have been transferred to a company represented by J. C. Johnson of Lincoln, Neb., to be known as the Golden Age M. Co., capital $3,000,000. The present works will be cleared out and retimbered and the mill overhauled and remodeled.

LINCOLN COUNTY.

At Minidoka the Yale Dredge Co. has been operating the bars of Snake river for five years, and has decided to put in a larger plant, worked on the suction principle, the gold-bearing sand and gravel being drawn up to a system of sluice boxes on the dredge. The gold in the bars of Snake river is very fine and light, but settles in the gravel within a few feet of the surface, and is hard to save. A system of burlaps connected with the sluices, however, has worked well, and ground that pays 10 cents to the cubic yard can be profitably worked.

OWYHEE COUNTY.

For the Snake river electric power plant of the Trade Dollar Con. M. Co., the line to the Trade Dollar is completed; three sub-stations will be built — one at Dewey, one at the Black Jack and one at the Trade Dollar—all of structural steel, asbestos lined, and fireproof. In these sub-stations will be located the step-down transformers, which will reduce the voltage from 20,000 (the voltage over the main line) to the voltage of the motors. Work on the dam at Snake river is progressing, and it is expected that the plant will be in working order by 1901.

SHOSHONE COUNTY.

A. Burch, Supt. Bunker Hill & Sullivan M. Co., at Wardner, says the property is maintaining its usual large output and paying dividends regularly. The long tunnel being run from a point near the concentrator to tap the ore bodies of the mine is progressing.

The Clark tunnel, at Sunset, reports 8 feet of galena in the tunnel.

Near Weippe, in the Pierce river district, a quartz discovery is reported carrying high values in gold and silver.

At Wallace the crosscut tunnel on the Headlight is in 175 feet.

Near Burke, Hale & Brower of Butte, Mont., have bonded the Treasure Vault, on Nine Mile, for $50,000—10% down, 40% in six months, the balance in one year. Assays go 60% lead, thirty-four ounces silver.

The Standard M. Co. is putting in a new air compressor and electric plant. The compressor will have a capacity of fifty drills. The new electric plant will furnish power to haul the ore out of the half-mile tunnel. The mine is putting out 500 tons of ore daily. Dummy cars and the overhead trolley will be used.

Murray reports copper ore in the Goldback shaft on the Butte Placer. It is estimated the rock will go 40% copper.

WASHINGTON COUNTY.

The tunnel on the Decorah mine, in the Seven Devils, has cut the vein by diamond drill and tunnel.

MICHIGAN.

HOUGHTON COUNTY.

At the Calumet & Hecla the shaft has six compartments, each of which is as large as an ordinary shaft, one for the ladderways and the sixth for the wires and pipes which are necessary for the telephones, light, power, water and compressed air. The remarkable feature of this great mine is that the course of the vein is so undeviating that the engineers can plan work ahead for thousands of feet with the absolute certainty that the actual workings will agree with the plans. As a result the underground workings are laid out with mathematical accuracy. The great pumps that hoist thousands of gallons of water every hour are operated interchangeably by compressed air and electricity. There are 300 power drills constantly in operation, each of them doing the work of six men, operated by compressed air, and these are kept at work night and day. Every drift is constantly under the eye of the engineer in his office on the surface, and the result of every shot is known as soon as the smoke clears away. Every ton of ore hoisted is automatically registered in the office, and the condition of the entire mine at any given moment is but a matter of a few minutes' calculation and a few inquiries by telephone. The air supply of the mine is good; blowing engines send it down to the bottom of the shaft, where it is caught by fans and carried through pipes into the headings of the drifts.

The News Bureau says: "Osceola is laying the foundations for the addition to its new mill. This addition will contain four stamps, each capable of crushing over 500 tons of amygdaloid rock daily."

MONTANA.

DEER LODGE COUNTY.

At Anaconda the Amalgamated Copper Co.'s new smelting plant is building. The concentrator structure will be 646x433 feet, the roaster building 330x98 feet, the converter 352x180 feet, the reverberatory 518x183 feet, the blast furnace 181x82 feet, the smelter power plant 515x34 feet. In one end will be located the plant's machine shops. These are the main buildings. Besides there will be dust chambers 40x200 feet for the converter, roaster and blast furnaces; a clay building 32x150 feet adjoining the converter building, where the converters will receive their clay lining; three storage bins for the blast furnace, each 28x300 feet, and minor structures.

NEVADA.

ESMERALDA COUNTY.

At Silver Peak nothing is known of the rumor that John W. Mackay had purchased the Blair group of mines. Two million dollars is the price locally placed on the property, which is equipped with a 30-stamp mill, old style.

Supt. S. R. Wasson at Silver Peak says that on the 1st of October mining and milling will resume.

WHITE PINE COUNTY.

The Pilot Knob group of copper mines, West Camp, 7 miles west of Ely, is reported bonded by agents of W. A. Clark.

NEW MEXICO.

SOCORRO COUNTY

The Cooney mill, Mogollon district, which had been shut down several months to half time on account of a shortage of water, is again running, there being now sufficient water to keep the plant going at its full capacity. The mine is expected to show a production of $20,000 during September.

OREGON.

BAKER COUNTY.

Manager Esselstyn of the North American M. Co.'s copper mine at Burkemont says: "We are going into the ground five ways at once. Of course, the only way we can see into the ground is to dig into it by candle light."

Manager C. H. Thompson of the Bunker Hill mine, Cable Cove district, says that in the lower level of the Bunker Hill is a body of high-grade ore.

J. T. Grayson, who bonded the Baby McKee group in Cable Cove, has thirty men employed on a 5000-foot tunnel which is expected to cut the ledge.

F. Brile, Supt. Badger mine, Susanville district, south of Sumpter, has men developing the leads on the group being explored.

C. Whitaker, manager Baisley-Elkhorn properties, north of Baker, says the recent strike in the shaft of the Baisley-Elkhorn is larger than at first supposed.

JOSEPHINE COUNTY.

Near Grant's Pass W. T. Cope has bonded the Golconda mine on Williams creek for $12,000.

The Hammersley mining property has been bonded by H. Phillips.

SOUTH DAKOTA.

LAWRENCE COUNTY.

Following is the annual report of the Supt. Homestake M. Co.:

J. B. Haggin, Esq., Pres. Homestake M. Co., San Francisco, Cal.—During the fiscal year just closed operations at the works were attended with little or no delay. Repairs, made necessary by the ordinary wear and tear to the plant at large, have been well kept up, while the company's shops for taking care of its machinery have been greatly enlarged and much improved.

By consolidation, there has been acquired the Highland mine, with its 130-stamp mill and very fine hoist; the Black Hills & Fort Pierre Railroad, used for hauling wood, coal, mining timbers, etc., to the works; and the water, water rights, flumes, ditches, etc., of the Black Hills Canal & Water Co., while, by purchase, a considerable area of adjoining ground has been added to the property of the company. The important, extensive and expensive betterments to the property, which have been under construction for some months past, will soon be finished, when the increase of the company's net revenue to follow will begin—I mean the cyanide plant with a capacity of 1200 tons daily to treat the tailings from the mills and a water system to increase the present deficient supply.

The Ellison hoist has been sunk from the 500 to the 600 level, the B. & M. shaft from the 800 to the 1000 level, the Golden Prospect shaft from the 500 to the 600 level and the Golden Star shaft from the 900 to the 1100 level. The ore development at the greater depths attained are very encouraging, and insure a long life to the mine.

For details of bullion produced, ore crushed, etc., see report accompanying this. T. J. Grier, Supt.

Bullion Account.

UTAH.

JUAB COUNTY.

The Centennial-Eureka is to have a smelter.

SUMMIT COUNTY.

Record: During August the Silver King mill turned out concentrates to the amount of 1,456,180 pounds.

TOOELE COUNTY.

The Con. Mercur G. M. Co. during August earned $186,446.46, expenses $86,785.24, net profits $96,661.24—about 10 cents per share upon the capital stock of the company. The cost of mining 30,485 tons during the month was $1.46; cost of milling, $1.36; total, $2.82 per ton for prospecting new ground, extracting and milling the ore.

WASHINGTON.

FERRY COUNTY.

The Mountain Lion Co. has given a 90-day bond on the property to A. E. Palmer of Spokane.

STEVENS COUNTY.

At Flat Creek mining camp, Colville Indian Reserve, the Examiner M. Co. has a new steam hoist. F. A. Russell, manager, Ryan P. O.

The law of 1892 allowed any one to go upon the Colville reservation and prospect for minerals. Consequently a man can go into the land office and swear that he has been over each and every legal subdivision of a quarter section and he can make application for a homestead. If he does this within one minute after 12 o'clock noon on October 10, or any time thereafter, the register will take the application. It is not necessary that the settler should go over the land after the hour of opening. But the President's proclamation warning "sooners" against making settlement prior to the hour of opening will be observed, and in cases of contest the difference between a filing upon land and a settlement upon the same will be gone into, the first man showing actual settlement established after the opening hour winning out in the contest.

WYOMING.

CARBON COUNTY.

At Battle Lake the Ferris Haggerty is putting in a new hoisting plant, a No. 40 hoister and an additional 80 H. P. boiler, together with three No. 3½ Leyner drills. They expect to keep sixty ore wagons on the road to Wolcott, hauling high-grade ore. The vein maintains its average width of 21 feet, running 40% copper. There was a strike among the shaft men last week and fifty men were discharged.

FOREIGN.

BRITISH COLUMBIA.

Rossland reports that the Molly Gibson mine, Supt. Carmichael, is employing twenty men. The tramway is to be completed by October 15th, and the property will then commence regular shipments. The management figures on shipping 500 tons per month, and will have seventy-five men at work. A mill site has been cleared at the mine, and application made for a grant. The company will build a mill next spring.

According to the report of Supt. R. R. Hedley, the cost per ton of ore of smelting to matte for the year ending September 30, 1899, Hall Mines smelter, was reduced from $3.66 in the previous year to $2.96, as follows: Flux, $0.196; fuel, $1.445; labor, $1.32. The matte averaged 45% copper, 290 ozs. silver, 0.77 oz. gold per ton. The silver loss amounted to 42,838 ozs., the total amount charged being 532,837 ozs. The ore averaged 2.49% copper; the yield was 2.34%, 90,000 pounds of copper being lost in the slags. One of the reverberatory furnaces was lengthened and repaired. It was found that the brick bottom was extremely thin, in places but 2.5 inches of the original 9 inches remaining. After twenty days' work smelting base metallics, with poor results, it was deemed advisable to tear out this bottom, finding therein, after careful sampling, about twenty-five tons of copper, 20,000 ozs. silver and 400 ozs. of gold.

Manager E. N. Fell of the Athabasca mine reports for August a run of 30 days, 14 hours; tons crushed, 430; bullion recovered, $12,525; concentrates, $4875; total, $17,400. Value of bullion recovered per ton of ore crushed, $29.13; value of concentrates recovered per ton of ore crushed, $11.33; total values recovered per ton of ore crushed, $40.46.

The Kaslo & Slocan railway brought 1000 tons of ore to Kaslo during August: 547 tons from the Whitewater, 210 tons from the Payne, 104 tons from the Rambler-Cariboo, and 42 tons from the American Boy.

Lardeau reports that the recent shipment of twenty tons of Triune ore netted the lessees $5376.84, about $268.84 per ton; value per ton $249.26 silver, $11.88 gold, $29.49 lead; aggregate gross value $290.63; freight and treatment from mine to smelter, $47 per ton; cost $12 per ton to mine it; deducting amount and freight from gross returns per ton leave a profit of $231.70 per ton.

The concentrator at the Ivanhoe mine, near Sandon, will commence operations Sept. 30th; capacity 150 tons per day. The Minnesota Silver Co. owns the property.

J. Cobledick, manager Cobledick gold dredge on the Fraser, near Lytton, reports that the dredge is in operation every hour of the twenty-four, the men working three shifts; each twenty-four hours 1500 cubic yards of gravel are taken from the bottom of the stream and passed over the treating tables.

The management of the Tamarac mine, near Ymir, will next summer erect a mill and construct a tramway 5800 feet long.

At Kaslo the Ruth No. 2 is to start work again.

Montreal asserts that by April, 1901, the Knob Hill, Old Ironsides, Gray Eagle and the Granby Con. will be consolidated into one company, with a capital of $20,000,000. A refinery is to be built at Grand Forks and the smelter capacity increased.

Cranbrook reports August ore shipments from the North Star and Sullivan amounted to 5,320,000 pounds (2660 tons, 120 carloads). Adding 1900 tons of high-grade concentrates from the St. Eugene, at Moyies, gives 4650 tons silver-lead ore from the three mines within 20 miles of Cranbrook.

Five miles from Nelson the Hall M. & S. Co. will install at the Silver King extensive machinery. The machinery is to be used for a steam boiler, 85 H. P., double-drum hoisting engine, large pumps and complete hoisting outfit. Seventy-five men are at work on the mine, cleaning up the property. The company will repair and operate the aerial tramway from the mine to the smelter.

At Camp McKinney the Minnehaha G. M. Co. of Toronto has been absorbed by the Sailor Con. M. & M. Co. Work will be resumed on the Sailor. The capital stock is to be increased from $1,250,000 to $2,000,000; the shareholders in the Minnehaha will receive one share in the Sailor for two held in the Minnehaha, which is capitalized at $1,000,000. W. C. Fox of Toronto is expected to arrange for the resumption of work.

At Princeton the Princess May has been bonded for $35,000 to G. R. Lock, in the interests of English capitalists. On a crosscut of 65 feet an average assay of 5% copper is obtained.

At Grand Forks, talking of operations of Boundary mines, S. H. C. Miner, Pres. Granby S. Co., says: "We have kept clear of the markets, not attempting to protect our shares. We have 10,000,000 tons of ore in sight that can be treated. I informed our smelter Supt., Mr. Hodges, a year ago, that we must mine, ship and treat $5 ore at a profit. Reasonable handling charges when fully equipped, little economies here and there and other factors will accomplish this. We expect to install an 80-drill plant in the near future, and will be in position within fifteen months to treat 2000 tons of ore per day at Grand Forks. I expect these figures will be doubled later on and to see us operating a duplicate 2000-ton smelter in Grand Forks. The Michigan mines, operating their own refineries, turn out finished copper at a cost of 6 cents per pound. We have not yet worked out a portion of the treatment problem. We must erect our own refinery. Copper matte, after treatment in New York, nets about 10½ cents per pound here. We purpose to have this New York rakeoff, and the only way it can be done is by erecting our own refinery and refining our own matte."

MEXICO.

At Torreon the Valardena M. & S. Co. operate five shafts on carbonate deposits, worked by a system of pillars, taking out good ore and leaving poor ore as pillars. The output is about 250 tons per day, which the smelter converts into base bullion, shipped and refined in Omaha. They have also a matte smelter, in which they are smelting copper ores from a copper deposit in San Lorenzo, and from which they are turning out a matte containing 50% copper, smelting approximately ten tons to one. Lime for the smelter is secured close at hand, iron from Durango, silica from San Lorenzo. C. Wilhelmi is general manager, M. Dahlgren mining superintendent, Wm. Daly smelter superintendent. Wages for miners range from 75 cents to $1.50, Mexican, per eight-hour day; laborers 75 cents, Mexican.

The output of silver and lead in the Parral district was $4,000,000 value last year. There are fifteen mines in operation. The output of ore in the Parral district is 20,000 tons a month. Labor is cheap. Mexican miners who are good workmen are paid $1 a day of their own money. "Boss" Shepherd is still operating in Chihuahua, and is driving a 3-mile tunnel.

RUSSIA.

Vice Consul General Hanauer says: There are but four works in the Ural region of Russia where gold is obtained by means of chemical process. The former gold mines, having given out, are not worked any more. While the world's annual gold production has increased 16.3% during the last decade, that of Russia has remained as before, amounting to about 2400 poods (86,668 pounds) yearly. But platinum, of which the Ural mountains furnish 95% of all the world's supply, has increased both in quantity and value. The amount of this metal produced in the Ural region in 1899 was 13,242 pounds, as against but 6365 pounds in 1890.

THE KLONDIKE.

According to the latest information from the Gold Commissioner at Dawson, royalty will be paid this season on $16,000,000. Reports from Stewart river, 200 miles distant, has caused another exodus to that river.

Wages on the hillside claims at Dawson have been reduced to $4 per day and board for underground miners and $3.50 per day and board for top men. A few individual owners are still paying the old scale of $5 per day and board, or 80 cents per hour. About 1200 men are affected. They claim the wages paid are not in proportion to other expenses and talk of organizing a miners' union to enforce the old rate.

Personal.

C. H. Cutting is Supt. Troy, Arizona, Copper Co.

W. S. Keyes has returned from Rossland, B. C., to San Francisco.

J. J. Morris is the new Supt. of the Mt. Hood-Sunrise Co., Rawhide, Cal.

Hennen Jennings is in Colorado in the interest of his London associates.

Luther Wagoner has returned to San Francisco from Mariposa county, Cal.

W. McG. Logan is Supt. Old Home Con. mine, Blue Tent, Nevada county, Cal.

L. S. McClure of San Diego, Cal., is visiting his mining property at Neihart, Mont.

F. L. Van Orden succeeds F. G. Collins as Supt. Wyandotte M. Co., Houghton, Mich.

C. J. Schuster, Supt. Grizzly Ridge, Nevada county, Cal., mine, is in San Francisco.

J. W. Young, vice-president firm of Fraser & Chalmers, is visiting Grand Forks, B. C.

C. B. Van Nostrand of New York is visiting his mining property in Custer county, Idaho.

G. McM. Ross, Supt. Ophir and Mexican mines, has returned to the Comstock from San Francisco.

Bernard MacDonald, manager Le Roi mine, Rossland, B. C., has returned from Nome, Alaska.

J. H. McKenzie, Supt. Mariposa grant, has returned from the Alameda mine, Tuolumne county, Cal.

Jno. A. Chestnut will be Supt. of the work of the Hite Cove M. Co., Hite Cove, Mariposa county, Cal.

J. B. Parks is now superintending the operations of the Pacific Dredging Co. on the American river, Cal.

G. B. McAuley, managing director Cariboo Co., has returned from England to Camp McKinney, B. C.

W. W. Byrne of the Giant Powder Co., San Francisco, is locating a third magazine at Grand Forks, B. C.

G. W. Kimble of Placerville, Cal., is in Grant's Pass, Or., investigating mining property for San Francisco men.

Thos. J. Hurley, vice-president New York Exploration Co., is visiting the company's property at Guanajuato, Mexico.

J. F. Parks, Supt. the Kennedy and South Eureka mines, has returned to Amador county, Cal., from San Francisco.

Jno. Quinn has gone from Park City, Utah, to Sonora, Mexico, to the Montezuma C. M. Co., to superintend driving a tunnel 6000 feet.

F. Zeitler, vice-president California State Miners' Association, has returned to Nevada county, Cal., from San Francisco.

The venerable J. LeConte, professor of geology in the University of California, has gone to Europe on a year's leave of absence.

Irving E. Bush, a Los Angeles, Cal., mining engineer, has returned from Cape Nome, Alaska, where he had been operating a beach mining plant.

W. C. Ralston, president California Miners' Association, has been nominated for the Assembly by the Calaveras county, Cal., Republican Convention.

V. V. Clark, late Supt. cyanide department Cochiti G. M. Co., Albemarle, New Mexico, goes to Alamos, Sonora, Mexico, as general manager for the Higueras M. & M. Co.

Books Received.

Missouri Geological Survey, No. 13, 1900, quarto, 250 pages. This work may attract attention among geologists because of the extraordinary nature of its contents. Its author, the State Geologist of Missouri, seems to have thought that his ideas about things mundane and spiritual were important enough to be published at public expense, and there accordingly appears a jumble of stuff that might read all right at the close of the eighteenth century, but sounds somewhat archaic in these sunset months of the nineteenth century. One paragraph—the third on page 23—is quoted: "In the glorious interior of our blessed Motor, the Sun, dwells the Vicegerent of the true God. That his celestial realm is the logical rendezvous for the spritual product of the Earth, is shown by the fact that the first essential element of organic life is paid out by the Sun. And inasmuch as that productive energy cannot persist without a facility of renewal, the ultimate synthetic product of Earth, the Spiritual energy evolved by Afterthought, has no other logical destination than the serene and equable interior of our Sun." That kind of thing may be what Missouri wants, but it sounds funny in a report signed by a State Geologist and issued by the State.

Commercial Paragraphs.

THE E. P. Allis Co. of Milwaukee, Wis., has an order, through its Denver officer for a 100-ton copper smelting plant for the Boston & Wyoming Smelting Co., to be erected at Grand Encampment, Wyo.

THE Oregon Railway & Navigation Co. has published an excellent sketch of the gold fields of eastern Oregon, by P. Donan, the matter, in the form of a folder, being accompanied by an attractive map of the Baker City and Sumpter section.

J. GEO. LEYNER, Denver, Colo., recently shipped a compound air compressor and several Leyner drills to Lake City, Colo., for the Scantic G. M. & M. Co., who have a tunnel proposition. Mr. Leyner also reports the sale of a compressor and four air drills to the Blaine Mining & Exploration Co., at Ridgeway, Colo., on whose property a tunnel is to be driven.

THE M. C. Bullock Manufacturing Co., Chicago, Ill., has shipped a large mine ventilator to West Virginia, a hoisting plant to the Black Hills, another to Spring Valley, a Willans engine to the Massachusetts State farm, a large diamond drill equipment to Washington, and has orders for a hoist for the Mesabe Range, a large diamond drill and outfit for the Balkan States, a mine ventilator for West Virginia and a diamond drill for Missouri.

Recently Declared Mining Dividends.

Buffalo Hump M. Co., Idaho, 1%..Oct. 1
Gwin M. Co., California, $5000....Sept. 19

Obituary.

A. M. ESLER, a prominent pioneer miner, who did much to develop the Cœur d'Alenes, died suddenly on the 10th inst. at Altyn, 50 miles northwest of Blackfoot, Mont. He built the first smelter in Montana at Argenta in 1866, and was intimately connected with the mineral development of that State and Idaho.

List of U. S. Patents for Pacific Coast Inventors.

REPORTED BY DEWEY, STRONG & CO.,
PIONEER PATENT SOLICITORS
FOR PACIFIC COAST.

FOR THE WEEK ENDING SEPT. 11, 1900.

657,689.—HOISTING APPARATUS—H. C. Behr, S. F.
657,586.—CIPHER CODE—E. F. Cassell, Seattle, Wash.
657,587.—CIPHER CODE—E. F. Cassell, Seattle, Wash.
657,590.—ROTARY ENGINE—E. E. Couture, Gualala, Cal.
657,692.—RAISIN CLEANER—H. Eastwood, Fresno, Cal.
657,697.—HAND GRIP—Getz & Westall, S. F.
657,599.—COPY HOLDER—G. F. Heiss, Everett, Wash.
657,700.—HARVESTER—B. Holt, Stockton, Cal.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

BALING PRESS.—No. 657,287. Sept. 4, 1900. C. J. Johnson, Paso Robles, Cal. This invention relates to that class of baling presses known as "horizontal continuous presses." The object is to provide a means by which the opening and closing of the doors, and the various operations of the machine are performed mechanically, and hand labor is reduced. It consists of a frame having the press-box mounted at one end, a revoluble cam-carrying disk at the opposite end, a follower and a rebounding plunger beam having a slotted extension from one end adapted to guide said beam in its movements, said beam actuated by the cams so that the follower is reciprocated within the box. There is an extension through which the compressed material is forced to form the bale, this extension having a movable top plate and screws by which the outer end of the plate is adjusted to regulate the size of the discharge opening and determine the amount of compression of the baled material. The material is charged into the press through a top and a side door so hinged as to open outwardly from each other and by means of oscillating shafts, rocker arms and a rotable disk, with means engaging these arms, the doors are automatically opened and closed, being retained in their closed position by spring-pressed latch bolts.

LUBRICATOR.—No. 657,219. Sept. 4, 1900. Byron Jackson, San Francisco, Cal. This invention relates to an apparatus by which bearings of any description are constantly and automatically lubricated. A flange or collar is secured to a revoluble shaft and formed with a cup having a rounded interior and one end opened, a second cup surrounding the shaft has a bearing formed rigid therewith and entering the opening end of the first named cup, but without contacting therewith. This bearing has a passage through it, and an annular loose cover for the second cup through which the shaft passes. A bent tube has its open end lying close to the inner wall of the first-named cup so that the revolution causes the oil to be taken up by this tube, carried from one cup into the other, whence it is allowed to pass into the bearing around the shaft.

AUTOMATIC ADJUSTMENT FOR HARVESTER REELS.—No. 657,229. Sept. 4, 1900. S. M. Warder, Winters, Cal. This invention relates to a means for adjusting the reels of harvesters, headers and the like apparatus so that the reel will always be in the proper position to sweep the grain toward the sickle whether the straw be short or long. It consists of means carried by the header portion of the harvesting apparatus by which the sickle bar is raised or depressed, a reel adapted to sweep the grain toward the sickle bar, reel timbers to the front ends of which the reel shaft is journaled, links supporting said reel timbers at the rear and at points intermediate between the reel and front end of the bars in such a manner that the bars carrying the reel frame are tilted about their pivot points so as to move the reel frame upward and forward, or downward and backward in unison with the movements of the header frame.

CARBURETERS FOR EXPLOSIVE ENGINES.—No. 657,738. Sept. 11, 1900. Henry L. Jessen, Watsonville, Cal. This invention relates to improvements in explosive engines and generators by which the gas or vapor used in such engines is produced, and it is intended particularly to provide for a constant and complete vaporization of a hydrocarbon liquid, a mixture of air with the vapor thus produced to make it explosive, and a means for regulating the flow by which it is supplied only when the engine is in operation. The invention comprises in an explosive engine, a horizontally journaled revoluble generator, with means for advancing the liquid therethrough, and means for heating the same, an open pipe connection between the discharge end of the generator and the inlet valve of the engine whereby a vacuum is produced in the generator by the movement of the engine piston, a pipe and trap connection between the opposite end of the cylinder and the supply tank whereby the hydrocarbon liquid is drawn into the generator when the engine piston produces a vacuum and the supply is cut off when the inlet valve of the engine has not opened or the engine is at rest.

RAISIN CLEANER AND CAP STEMMER.—No. 657,692. Sept. 11, 1900. Harry Eastwood, Fresno, Cal. This invention relates to an apparatus designed for cleaning raisins and for performing work known as "cap-stemming." It comprises revoluble drums having partially inclosing segmental fenders, flexible spring-pressed aprons capable of elastic yield at any point and between which and the drums fruit is caused to pass, means for delivering the fruit into said space near the upper part of the drum, a tailboard or screen over which the fruit is passed from the drums, and an air-forcing blast mechanism by which the refuse is separated from the fruit.

METAL LATH ATTACHMENT AND SUPPORT.—No. 657,827. Sept. 11, 1900. Wm. McCall, San Francisco, Cal. This invention relates to a means for securing and supporting metal lathing, such as is employed in the construction of fireproof and other buildings. It comprises a supporting base formed of plates or strips of sheet metal having slits cut upon the sides to form tongues with one end remaining attached to the strip. These strips extend over the lower flanges of the I-beams, and have one or both edges turned at right angles with the vertical depth of the strips, and transverse connections having ends passed through the strips and locked thereto by twisting or bending.

TRAVELING HARVESTER.—No. 657,700, Sept. 11, 1900. Benjamin Holt, Stockton, Cal. The object of this invention is to enable a traveling harvester and thresher to be used on side hills and maintain the frame of the thresher and cleaner in an approximately horizontal position by raising the wheels on one side and lowering the wheels on the other side with relation to the thresher frame, so that while the wheels travel in different horizontal planes upon the inclined surface of the ground, the threshing machine frame will be maintained in the desired position. In conjunction with these movable wheels there are mechanisms by which the up and down movement of the wheels effected simultaneously. It comprises a main frame with supplemental frames in which the bearing wheels are journaled upon opposite sides of the machine. A rack bar is guided and slidable transversely with relation to the main frame, with a mechanism by which the rack bar is movable in either direction. Chains connected with the bar extend outwardly in opposite directions and there are guide pulleys around which the chains pass, standards carried by the wheel frames to which the outer ends of the chains are connected, anti-frictional rollers or slides carried by the movable wheel frames, and fixed guides against which they are movable.

Latest Market Reports.

SAN FRANCISCO, Sept. 20, 1900.

SILVER—Per oz., Troy: London, 28¾d (standard ounce, 925 fine); New York, bar silver, 62⅝c (1000 fine); San Francisco, 62¼c; Mexican dollars, 50½c.

COPPER.—New York: Lake, 1 to 3 casks, 17.00 cash; carload lots, 16.87½; Electrolytic, 1 to 3 casks, 16.87½; carload lots, 1675.; Casting, 1 to 3 casks, 16.87½; carload lots, 16.70. San Francisco: 18. Mill copper plates, 20c; bars, 22@23c.

August exports of copper from this country were 31,012,800 pounds, compared with 24,460,800 pounds in August, 1899; total exports of copper from the United States from Jan. 1 to Sept. 1, this year, amounted to 259,297,920 pounds, against 166,969,600 pounds for the corresponding months of last year.

LEAD.—New York, $4.37½; Salt Lake City, $4.25; St. Louis, $4.32½; San Francisco $5.00, carload lots; 5¼c 1000 to 4000 lbs.; pipe 6¾, sheet 7½, bar 6c; pig, $4.70 @5.10. London, soft Spanish, £17 15s; English, £18.

SPELTER.—New York, $4.15; St. Louis, $4.00; San Francisco, ton lots, 5½c; 100-lb lots, 5¾c.

ANTIMONY.—New York, Cookson's, 10½c; Hallett's, 9½c; San Francisco, 1000-lb lots, 12c; 300 to 500 lbs., 13@14c; 100-lb lots, 15@18c.

IRON.—Pittsburg, Bessemer pig, $15; gray forge, $14.00; San Francisco, bar, per lb., 2.50c in small quantities.

Comparison of latest prices shows foundry pig No. 2, Philadelphia, declined from $15.75 to $15.50; foundry pig No. 2, local Chicago, declined from $15.50 to $15; Lake Superior charcoal, Chicago, declined from $19 to $18.50; steel billets, Pittsburg, declined from $17.50 to $17; steel billets, Philadelphia, declined from $20 to $19.50; steel rails, heavy Eastern mill, declined from $35 to $30. Old iron rails, Philadelphia, advanced from $14 to $14.50; refined iron bars, Philadelphia, declined from $1.30 to $1.25.

STEEL.—Bessemer billets, Pittsburg, $17.50; sheet bars, $22.50; San Francisco, bar, 7c to 12c per lb.

TIN.—New York, pig, $31.75; San Francisco, ton lots, 32c; 1000 lbs., 32½c; 500 lbs., 33c; less, 34c; bar tin, ℔ lb, 37½c.

QUICKSILVER.—New York, $51.00; large lots: London, £9 2s 6d; San Francisco, local, $49.00 ℔ flask of 76½ lbs.; Export, $46.00.

NICKEL.—New York, 50@60c ℔ lb.

MAGNESIUM.—New York, $3.00 ℔ lb.; San Francisco, $4.00.

ZINC.—San Francisco, 5½c; slab, 6c; bar, 7¾c.

SOLDER.—Half-and-half, 100-lb. lots, 20½c; San Francisco, Plumbers', 100-lb. lots, 17¼c.

BABBITT METAL.—San Francisco, No. 1, 10c.

ASSAY LITHARGE.—San Francisco, 10c ℔ lb, small lots.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 35c.

PHOSPHORUS.—F. o. b. New York or Philadelphia, 45@50c ℔ lb.

TUNGSTEN.—New York, ℔ lb., 95c; San Francisco, $1.15.

FERRO-TUNGSTEN.—New York, 37%, 35c; San Francisco, 65c (60%).

FERRO-MANGANESE.—Pittsburg, 80%, domestic, $85, large lots.

PLATINUM.—San Francisco, crude, $17 ℔ oz.; New York, $18.25; manufactured, $19.50@22.00.

POWDER.—F. o. b. San Francisco: No. 1. 70% nitro-glycerine, per lb., in carload lots, 15¼c; less than one ton, 17¼c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11¾c; less than one ton, 13¾c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2 per keg.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9, in lots not less than 1000.

FUSE.—Triple tape, $3.60 per 1000 feet; double tape, $3.00; single tape, $2.65; Hemp, $2.10; Cement No. 2, $3.00; Cement No. 1, $2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 12½c ℔ set; 14 oz., 40s., 11½c.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 32½@34½c ℔ lb.; carloads, 31@32c; in 10-lb. tins, 40c; sulphuric acid, 66% B, 2c ℔ lb.; soda ash, $1.60 ℔ 100 lbs. 58%; hyposulphite of soda, 2¾@3c ℔ lb.; blue vitriol, 5½@6c ℔ lb.; borax, concentrated, 7@8c ℔ lb.; chlorate of potash, 12@13c; roll sulphur, 6c; alum, $1.90@2.00; flour sulphur, French, 2¼@2½c; California refined, 1¾@2c; nitric acid, in carboys, 8c ℔ lb.; caustic soda, in drums, 3@4c ℔ lb.; Cal. s. soda, bbls., $1.00; sks, 95c ℔ 100 lbs.; chloride of lime, spot, $2.50@2.60; nitrate of potash, in kegs, 8c; caustic potash, 10c in 40-lb. tins.

OILS.—Linseed, pure, boiled, bbl., 75c; cs., 80c; raw, bbl., 73c; cs., 78c. Deodorized Stove Gasoline, bulk, 15c; do., cs., 21c; 86° Gasoline, bulk, 21c; do., cs., 27c; 63° Naphtha or Benzine, deodorized, in bulk, per gal., 14c; do., in cs., 20c; Lard Oil, Extra Winter Strained, bbl., 70c; cs., 75c; No. 1 bbl., 50c; cs., 55c; Neatsfoot Oil, coopers' bbls., 60c; extra bbls., 65c; cs., 60c; No. 1 bbl., 52½c; cs., 57½c.

COAL.—San Francisco, coast, yard prices: Wellington, $9; Seattle, $7.00; Coos Bay, $5.50; Southfield, $9.00. Cargo lots, Eastern and foreign: Wallsend, $8.00; Brymbo, $7.50; Pennsylvania, hd., $14.00; Scotch, $8; Cumberland, $12; Cannel, $9.50; Welsh Anthracite, $12.00; Rock Springs, $8.50; Colorado Anthracite, $14.50. Coke, $16 per ton in bulk; $18 in sacks.

Good Wire Cloth.

Are you perfectly satisfied with the wire cloth you are now using? Does it wear as long as you think it should and do the work to your entire satisfaction? There are other makes of wire cloth upon the market, but this is the only one that can always be depended upon.

The "Perfect" double-crimped, steel mining cloth, manufactured by the Ludlow-Saylor Wire Co., Fourth and Elm Sts., St. Louis, Mo., will do your work to your entire satisfaction. The steel wire cloth manufactured by this company has withstood the severest tests for years, and other makes are constantly being discarded and the "Perfect" adopted. This company also manufacture a very convenient and reliable steel candlestick, which miners say can not be equalled. To see it is to appreciate its worth. *

WANTED.

A Rich Placer proposition, adapted to working by Railroad Steam Shovel, or Dry Land Excavator. Description, with price and terms, to receive attention must be accompanied by reliable reports and references.

Address: **EDWARD N. BREITUNG,**
MARQUETTE, MICH.

Quicksilver

—FOR SALE BY—
The Eureka Company,
OF SAN FRANCISCO.
ROOM 1, - - 320 SANSOME STREET,
SAN FRANCISCO.

SITUATIONS WANTED.

WANTED.—SITUATION BY A COMPETENT and experienced millman on concentrators or battery frame. Highest references. Address L. W , 509 Kearny street, room 2, first floor, San Francisco, Cal.

MINING ENGINEER (technical training), twenty years' experience as surveyor, assayer, superintendent and manager of mines and mills; business qualifications; linguist; at present general manager mining and milling proposition in Mexico; desires to make a change on account of health; best references. Address S. O., Mining and Scientific Press.

WANTED.—A SITUATION AS MANAGER OF A gold quartz mine in Colorado or California; understand assaying and chlorination; salary, one-half in mining stock and one-half in cash, $200 per month. Reference as to ability: L. X. Smith, manager of Gillett Gold Extraction Co. Address L.W. THIELE, Altman, Colorado.

WANTED SITUATION

AS MILLMAN, FOREMAN, OR ASSISTANT.

Have had eight years' experience with one of the largest mining companies in Idaho, in pan amalgamation, cyaniding and refining of bullion. Ability to do assaying. Refer to De Lamar Mining Co., De Lamar, Idaho. Address W. H., this office.

WANTED.

INFORMATION WANTED

regarding whereabouts of John R. Williams, about 70 years old. Last heard of as Supt. of a mine in Copper's Hill, Vermont, in 1866. Has an adopted son about 32 years old. Supposed to be placer mining in the West, possibly California. $25.00 reward at Deseret News Office, Salt Lake City, Utah.

WANTED.—A COMPETENT AND RELIABLE man to take charge of a gold quartz mine and stamp mill in Sinaloa, Mexico. Must understand assaying and have business qualifications. References as to ability and honesty required. Address C. L. Merry, Pres. H G. M. Co., Kansas City, Mo.

WANTED.

Experienced Promoter and Stock Operators

to handle the sale of stock for an oil company. State previous experience.

For particulars, address
C. J. TALLON,
308 Market Street,........San Francisco, Cal.

Experienced Coal Miners

can secure **steady employment** either on **contract** or by **day's work** at the **TESLA COAL MINES, Tesla, Alameda County, California.** Good wages guaranteed, also good board. Good climate, and also good accommodations and houses for families.

For further particulars, please apply to the Superintendent at the Mines, or to the Company at 328 Montgomery St., San Francisco, Cal.

REFRACTORY ORES WANTED.

1000 TONS or more which will assay $75.00 Gold per ton and over, delivered free of charge at San Francisco, Cal. Correspondence solicited.

C. J. TALLON,
308 MARKET STREET, SAN FRANCISCO, CAL.

DELINQUENT SALE NOTICE.

EUREKA CONSOLIDATED DRIFT MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Placer County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 26) levied on the 9th day of August, 1900, the several amounts set opposite the names of the respective shareholders, as follows:

Name.	No. Cert.	No. Shares.	Amt.
Geo. W. Carpenter................	143	200	$2 00
Geo. W. Carpenter................	218	33	33

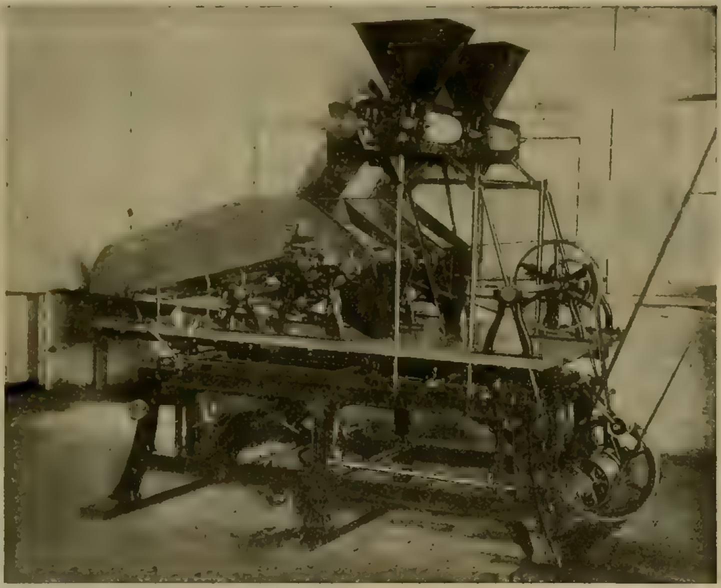
CROWN GOLD MILLING CO.

Manufacturers of the "CROWN" CONCENTRATOR and CROWN ORE SIZER. A dry process of sizing and concentrating ore, sand or gravel. Designed to accord fully with the laws of specific gravity, and especially adapted to refractory ore or localities where there is no water.

The chief claims for the Crown Concentrator are that it occupies less floor space and has nearly four times the capacity of any wet concentrator; that it will concentrate ores containing base and refractory metals that ordinarily slime and carry off values; that it effects a saving of values far above the ordinary methods of concentration.



We have, now in operation, a complete plant for crushing, sizing and concentrating ores by the

Crown Dry Milling Process.

Mine owners desiring tests made can forward us, freight prepaid, not less than 1000 lbs. nor more than 4000 lbs. of sample, for which a charge of $20 will be made. (This amount includes assaying, etc.)

Ores for which this process is adapted and of which consignments are solicited are any concentratable ores, pulps, tailings, or sands, carrying sufficient values, whether they have heretofore been profitably concentrated or not.

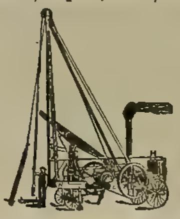
A BORE HOLE

is the cheapest, quickest, most direct, and most effective way to test lands for minerals, oil, gas, salt, sulphur, borax, water, etc.



THE STAR DRILLING MACHINES

excel for these uses. They will drill a hole through anything to any depth from 250 to 2500 feet The only machines made that are absolutely without annoying springs. They are simple, powerful and efficient. Easy to handle at work or on the road. Used in every State and Territory and in many foreign countries.

We also make full line of drill tool-bits, reamers, sand pumps, spuds, etc., etc. Write for illustrated free catalogue.

THE GRIFFIN
THREE ROLLER
ORE MILL.

The Griffin Three Roller Ore Mill is a simply constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilian Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

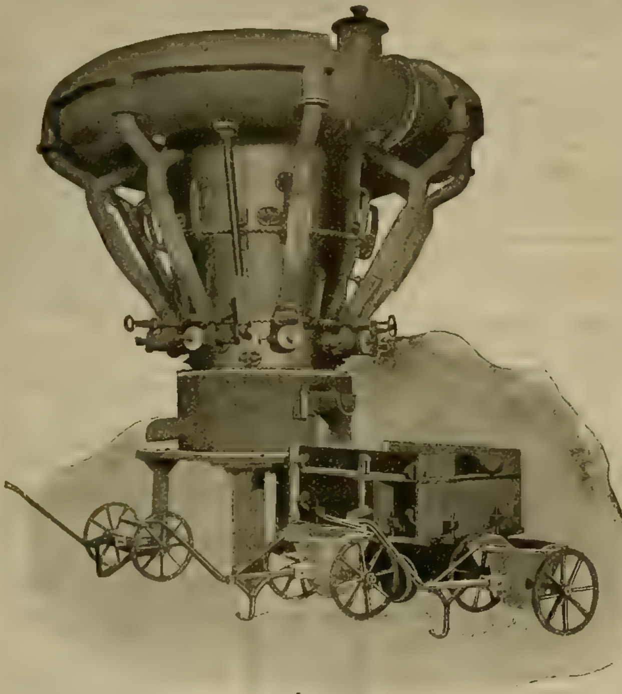
Bradley Pulverizer Co., Boston, Mass.



THE COPPER FURNACE

Here illustrated has OUR PATENT

WATER VAPORIZING ATTACHMENT.

Experience has proven this to be the best of all methods for applying water for the cooling of jackets. It has the further great advantage of using only about one-eighth the usual amount of water needed for that purpose, and all jackets are kept at the same temperature.

We Manufacture Smelting Furnaces and Equipments

FOR THE TREATMENT OF

GOLD, SILVER, LEAD, COPPER and NICKEL ORES.

of any desired tonnage capacity above forty tons per day, and put them into successful operation under guarantee. Write for catalogue showing different styles of furnaces.

We also design, manufacture and erect Smelter Sulphide Mills for crushing and sampling ores. We are the originators of the Narrow Face, Large Diameter, High Speed Crushing Rolls. A full description of our Crushing Machinery is given in a special catalogue, which will be sent on application.

THE COLORADO IRON WORKS CO.

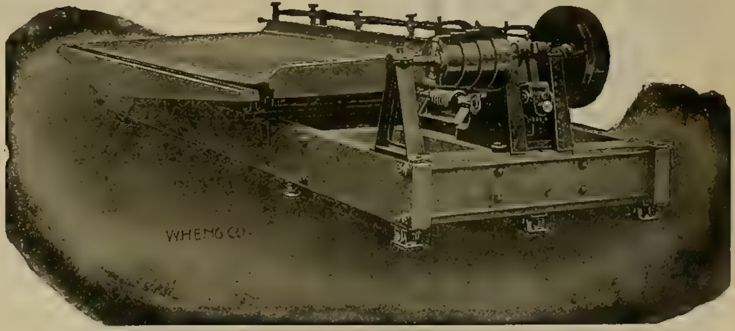
ESTABLISHED 1860. DENVER, COLO., U. S. A.

THE : CAMMETT : CONCENTRATOR.

Designed with some Regard for the Laws of Concentration.

From **The Denver Evening Post**, July 15th, 1900.

* * * "Now about concentrating tables. Here's a fellow who says there's nothing equal to the Wilfley, and I am trying to convince him that old man Woodbury over in California makes the finest table in the world." "No, sir," said his comrade, "you're way off. I've tried the CAMMETT too thoroughly to believe there's anything made to equal it."



Manufactured Under U. S. Patent No. 632,892; Dated Sept. 12, 1899.

THE LITTLE ALASKA GOLD WASHER.

Price $6.
Saves the Gold.
Weighs only 7 1-2 Lbs.

After several years' practical use in different fields, our washer has established its superiority over all placer or beach washers. It is just the washer for Cape Nome; it was used extensively in Alaska last year with every success In working the operator does not have to wet his hands and can stand in an upright natural position. It is just the washer for the poor man who has not the money to put in expensive machinery. It will do the work of ten men with gold pans. It is just the washer for the prospector, being light and easy to pack. Don't fail to write us if in need of a washer; we can save you *time, labor* and *money.* RUSSELL & KINSEY, 1237 Magnolia Ave., Los Angeles, Cal.

THE IMPROVED BARTLETT CONCENTRATING TABLE.

The BARTLETT CONCENTRATING TABLE has been GREATLY IMPROVED recently by the substitution of iron in place of wood wherever possible. It is now built with SOLID IRON TOP, PLANED TO A TRUE SURFACE AND POLISHED; all parts are made by template and EACH PART BEING INTERCHANGEABLE. As now constructed, the table has no special wearing parts and will last for many years. It has a CAPACITY OF FROM FIFTEEN TO FORTY-FIVE TONS IN TWENTY-FOUR HOURS, according to the class of ore worked. It is the only table in the world which will take the place of jigs and do away with all costly and complicated machinery.

It is Especially Designed for Separating Zinc from Lead.

Send for our illustrated catalogue, containing all the latest information on the concentration of ores.

THE COLORADO IRON WORKS CO.,

ASSESSMENT NOTICES.

MARIPOSA COMMERCIAL AND MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Mariposa County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 31st day of August, 1900, an assessment (No. 18) of Ten ($10) Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 320 Sansome street, room 24, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 10th day of October, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on THURSDAY, the 8th day of November, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

JOSEPH H. MOOSER, Secretary.

Office—320 Sansome street, room 24, San Francisco, California.

AMERICAN OIL AND REFINERY COMPANY.—Location of principal place of business, San Francisco, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 21st day of August, 1900, an assessment of ten (10) cents per share was levied upon all the subscribed capital stock of the said corporation, payable immediately to J. C. Anthony, secretary of said corporation, at its office, at room No. 323 of the Parrott building, Nos. 825 to 855 Market street, in the City and County of San Francisco, State of California.

Any stock upon which this assessment shall remain unpaid on the 26th day of September, 1900, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on MONDAY, the 29th day of October, 1900, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

J. C. ANTHONY, Secretary.

Office—Room 323 Parrott building, Nos. 825 to 855 Market street, San Francisco, California.

ALLIANCE EXPLORATION & MINING COMPANY.—Location of principal place of business. San Francisco, California; location of works, Ophir, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 3d day of August, 1900, an assessment (No. 3) of five (5) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 236 Sutter street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 11th day of September, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 2nd day of October, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

S. GOLDSMITH, Secretary.

Office—236 Sutter street, San Francisco, California.

POSTPONEMENT.

By order of the Board of Directors, the day of delinquence in the above assessment has been postponed to October 11th, 1900, and the day of sale to THURSDAY, the 1st day of November, 1900.

S. GOLDSMITH, Secretary.

Office—236 Sutter street, San Francisco, California.

MARINA MARSICANO GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Sunny Hill, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 15th day of September, 1900, an assessment (No. 24) of 2 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 217 Sacramento street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 23d day of October, 1900, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 12th day of November, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

CHAS. BOVONE, Secretary.

Office—217 Sacramento street, San Francisco, California.

DELINQUENT SALE NOTICE.

MAMMOTH GARFIELD GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Shasta County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the 5th day of June, 1900, the several amounts set opposite the names of the respective shareholders, as follows:

Name.	No. Cert.	No. Shares.	Amt.
Andrew Corbin	13	20,000	$3500 00
Philip Corbin	14	20,000	3500 00
Charles Glover	16	1,750	306 25
Jos. S. Silver	5	5	87
J. M. Spring	15	2,000	350 00

And in accordance with law, and an order from the Board of Directors, made on the 5th day of June, 1900, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the company, Rooms 54 and 59, No. 120 Sutter street, San Francisco, California, on TUESDAY, the 2nd day of October, 1900, at the hour of 2 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

SAM W. CHEYNEY, Secretary.

Office—Rooms 54 and 59, No. 120 Sutter street, San Francisco, California.

PATENTS

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & CO.'s Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

THE LUNKENHEIMER
Regrinding Swing Check Valve

Is much superior in point of excellence of material, design and workmanship to any other valve of its class upon the market. The body is heavy and well proportioned, the seat is carefully finished and the workmanship is first-class. This valve is so designed that when the disc is raised the passage through the body is fully equal to the diameter of the connecting pipes.

By means of the regrinding feature the usefulness of the valve can be prolonged indefinitely. When worn in the seat the valve can be reground without removing valve from connecting pipes.

Made in brass, medium and extra heavy patterns, screw and flange ends ¼ to 3 inches. Iron body, brass mounted, screw and flange ends 2 to 6 inches. All valves are carefully tested and warranted.

Specify "Lunkenheimer" make. Sold by dealers everywhere.

Write for Catalogue of Steam Specialties.

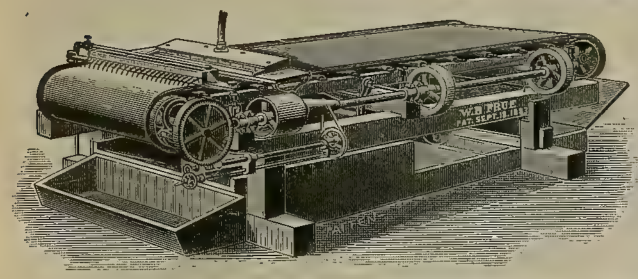
FOUR and SIX-FOOT FRUE VANNERS
With Brownell "Patent Lip" Flange Belts.



STANDARD MACHINE OF THE WORLD.

When a Concentrator like the Frue Vanner has been on the market nearly two decades, and the sales have constantly increased, it is safe to say it is the "Standard Machine of the World." More Frue Vanners have been sold during the last twelve months than for the same period at any time during the history of the machine. Practical mining men in all parts of the world where mining is carried on will testify as to its merits. It is the "standard" which all competitors are trying to imitate.

The results obtained by this machine are the "acme" of concentration, and several cheap and untried machines that have lately come on the market compare by it. The manufacturers will tell you that they are "just as good, and cheaper," etc. The facts are that no other concentrator made has an equal capacity, or will yield as clean a concentrate with as small loss in the tailings as the Frue Vanner. The amount saved from the lower first cost of an inferior machine counts little in the year's results, when compared with the increased output from a Frue. This machine not only gives better results at both ends of the belt (i. e., clean product and poor tailings), but is operated at less expense and requires less attention than any other machine on the market. At the Alaska-Treadwell mine, where they have ordered over 350 Frue Vanners, one man attends 48 machines for 12-hour shift.

New Mexico Placer Syndicate's Experimental Dredger.—See Page 372, "Catching Black Sand."

High Explosives.

In the issues of June 23, 30, July 7, 14 appeared a series of articles on high explosives which gave considerable detail regarding their use, manufacture and properties.

The chief explosives in use are nitro-glycerine, gun cotton, dynamites consisting of nitro-glycerine combined in various proportions with various bases, blasting gelatine, explosive gelatines and gelatine dynamites consisting of various combinations of nitro-glycerine and gun cotton, with a mixture of niter, cellulose and soda. Besides these is the Sprengel group of explosives, which consists of two practically inert substances, which, upon being mixed, produce powerful explosives. One of these substances is usually a hydrocarbon. An infinite variety of explosives of this class has been produced. Whenever an announcement is made of a new high explosive, insensitive and powerful, with secret ingredients, one is likely to be correct in the assumption that it is of the Sprengel group. Among the better known of these are the following: Rack-a-Rock—chlorate of potash and a liquid hydrocarbon (dead oil). Bellite—ammonium nitrate, nitro-benzole and niter. Roburite—ammonium nitrate with chlorinated di-nitro benzole. Hellofite — naphthaline, phenol, or benzine in fuming nitric acid. Securite—meta di-nitro benzole with nitrate of ammonia or niter.

The composition of a sufficient number of this class of explosives has been given to indicate the variety of constituents which can be used in making high explosives of this group. They are all insensitive and require a powerful initial explosion to educe their full power. Those having nitrate of ammonium are likely to be objectionable and not of advantage in submarine work and places where water is present, owing to the hygroscopic quality of that salt, which tends to deliquesce, unless well protected from moisture. Two recent explosives, of secret composition, marsite and thorite, probably belong to this class. It is thought that the latter may be usefully employed for torpedo shells, but it is as yet a question whether it can be completely exploded when in large charges, so as to give an explosion of the first order.

The picric acid class of explosives has attracted attention, more because of public notoriety than of intrinsic merit. Among these are: Melinite, for which the French have claimed so much, and lyddite, used by the English in the South African war. These are both essentially the same, consisting chiefly of picric acid combined with nitro-cellulose, and in some cases with cresilite, a coal tar product. Emmensite, another of the picric acid class, was experimented with, but has recently disappeared from sight.

The relative power of explosives is difficult to estimate, and authorities differ regarding it, for there is a notable difference in the results obtainable, depending on the physical conditions attendant upon the placement of the explosive and the means and method of the initial explosion. Some confinement of tamping is essential. The difference in the results secured between an explosion in the open and when covered, however slightly, is great, and is to be borne in mind by those using explosives for industrial purposes. The same amount or degree of tamping is not necessary for the high explosives as for gunpowder, and much needless and dangerous work might be avoided were due consideration given to this point of difference.

The following table is given as showing the relative force of the various high explosives, submarine work excepted, gunpowder being taken as one: Gunpowder 1, gun cotton 5.5, nitro-glycerine 12, explosive gelatine 14, blasting gelatine 16, dynamite (No. 1) 10, bellite (Sprengel) 6, roburite (Sprengel) 3, melinite 3, lyddite 3.

There is nothing definite nor positive about such comparative tables. A writer in an English technical journal on the same subject gives the following table: Gunpowder 1, nitro-glycerine 4, dynamite 5, gun cotton 5, explosive gelatine 6. The difference between the two tables is noticeable. All such comparisons must be accepted as rough approximations, since the same explosive under apparently similar conditions gives discordant results, for exact measures of the forces developed by explosives are impossible.

Experience and observation show that the energy of a high explosive depends considerably upon the character of the detonation by which the main explosion is secured, and one ounce of gunpowder, even when strongly confined, exploded in contact with gun cotton only inflames it, while ten grains of confined fulminate of mercury produces full explosion of the gun cotton. That the energy of explosion depends upon the nature and force of the initial explosion is probably true of all explosives, including gun cotton. A too low initial explosion will simply produce a rapid burning, instead of a detonation of the explosive. High explosives are subject to sympathetic explosions; that is, explosions of detached quantities of the material through the detonation of adjacent explosions. The effect of all explosives is increased by their being surrounded with a resisting medium. There are some singular phenomena noted in connection with explosions. One noticeable incident is cited in connection with the cutting of the Chicago drainage canal. The final bottom in a rock cut about 16 feet deep was being made by the removal of a depth of cutting of about 6 feet. The material was a close-grained limestone. By the use of a channeling machine the rock to be removed had been previously cut off vertically from the sides of the excavation. The face of the rock to be removed was nearly vertical. A row of holes quite near together had been drilled in a straight line across the cut, parallel with and about 6 feet back of the face. After the holes were loaded with dynamite they were simultaneously fired by electricity, throwing off a mass of rock back to the line of holes. After the blast, examination showed a plainly defined crack extending entirely across the cut, nearly parallel with and about 6 feet back of the line of holes which had been fired.

TABLE OF CONTENTS.

ILLUSTRATIONS.—New Mexico Placer Syndicate's Experimental Dredger; Sampling and Reduction Works, Republic, Wash., 369. A Coal Conveyor, 374. Latest Mining and Metallurgical Patents, 375.
EDITORIAL.—The "Scrip" Decision; Awarded the Grand Prize at Paris; The Stealing of Valuable Ore; Miscellaneous, 369.
MINING SUMMARY.—377-378.
LATEST MARKET REPORTS.—379.
MISCELLANEOUS.—High Explosives, 369. Concentrates, 371. Republic Sampling and Reduction Works; Blast Furnace Smelting; Catching Black Sand, 372. The Metallurgy of Zinc; The Etard Chlorination Process, 373. A Coal Conveyor; "Pure Water is a Poison;" American Miners in Korea, 374. Latest Mining and Metallurgical Patents, 375. To Splice a Wire Rope; Metric System and Equivalents; Mixing of Concrete; Some Facts About Steel; A Celebrated Case, 376. Personal; List of U. S. Patents for Pacific Coast Inventors; Notices of Recent Patents; Recently Declared Mining Dividends; Books Received; Catalogues Received; Commercial Paragraphs, 379.

Up to 1850 the United States was a nation of poor men. Mining began to put out great increase of natural wealth, and the national prosperity is directly and indirectly due to such output and mineral development. Mining has done a great deal for the nation, but the nation has done very little, comparatively, for the mining industry.

◆

It is recommended by thoughtful miners that it would be a needed additional safeguard against fire were a small building away from the main mine plant to be provided for a pump house. Of late several fires have been noted in mine plants that caught close to the pump, and with such suggested arrangement in case of fire connection could be made surer, with increased chance of saving the buildings.

◆

The difference between theory and condition is exemplified by the approved suggestion throughout British Columbia that the provincial tax on metal ores be made differential; that is, practically, that the tax be doubled in the case of ores sent out of the province for treatment, the idea being to encourage local smelters, which, in the main, is a good plan, but under existing conditions in British Columbia is not to be given serious consideration.

◆

When accumulated debris from the wash of the land occasioned by the development of the country and mining operations since 1849 covered some land along the Yuba and Feather rivers, Cal., it was loudly claimed that as a resultant the land was not worth 10 cents a square league. Now when the Government wants 3500 acres of this land to build dams and restraining barriers, this "worthless" land is held at figures up to $100 per acre.

◆

Tesla has so injured his prestige by premature and impracticable assertions that his announcements in the field of electrical discovery do not attract the attention they formerly commanded. His latest claim is to have successfully overcome the cause of electrolysis, and he has an invention designed to prevent the escape of electricity from a wire. He claims that he can insulate the wire by passing through it or near it air kept at a low temperature, producing a coat of ice on the wire which cannot be broken through by the strongest currents, and at the same time gives an insulation that costs practically nothing. By means of this the loss of electricity or electrical energy in transmission, it is claimed, can be rendered so small as to be insignificant, and power can be transmitted to great distances by means of underground wires. So far it is only a claim, but on a subject of surpassing interest to the electrical world.

The "Scrip" Decision.

That nothing is ever settled until it is settled right is again shown by the decision this week at Los Angeles, Cal., by Judge Ross in the U. S. Circuit Court in the case known as "the scrippers' suit," involving the right of "scrippers" to file upon oil land as agricultural land prior to the discovery of oil thereon. Judge Ross rules squarely against the scrippers. His former decision was based largely on legal technicalities and the letter of the law. Last Monday's ruling is based as largely on equity and the spirit of the law. In his decision he reviews the affidavits made by the scrippers that the lands filed upon by them were not mineral or claimed for mining purposes, and that their application therefor was not made for the purpose of fraudulently obtaining title to mineral land, but with the object of obtaining the same for agricultural purposes, and declares these affidavits to be manifestly false, holding that had the applicants stated that they wanted them for that purpose, and desired to select them under the law authorizing agricultural lands to be taken in exchange for lands situated within a forest reservation surrendered to the Government, the officers of the local land office would doubtless have refused to file or receive the selection of such land under the forest lieu land Act.

It is to be noticed that Judge Ross has injected an element of common sense into his ruling, where he holds that the "scrippers" could legally file only on lands "vacant and open to settlement," going on to exempt public land containing mines "of any mineral" from such locatable area. The cause of the bona fide prospector and miner has been aided by Judge Ross's decision.

The complainants had alleged the non-mineral affidavits were not required by law, but Judge Ross declares the fact remains that such affidavits were made and constituted a representation and one of the means by which the selectors sought to secure the lands, and, having been made for the purpose of evading and defeating the law, his court will not lend its aid toward securing the fruits of the fraud.

The statute under which the scrippers filed is a plain standing offer on the part of the Government to exchange any of its lands that are vacant and open to settlement for a like quantity of similar land within a forest reservation, for which it had previously issued a patent or to which an unperfected bona fide claim had been acquired.

In all cases the land authorized to be selected in lieu of that relinquished is required to be vacant and open to settlement. Vacant public land is open to settlement only when it contains no known salines or mines, whether of gold, silver, petroleum or any other mineral.

It is, to say the least, doubtful if any persons authorized to select vacant lands only are authorized to select lands in the actual bona fide occupancy of others under the settlement laws or under a mining location, even though the location be invalid by the absence of a valid discovery of mineral.

Whether the lands in controversy should be classed as mineral or agricultural is a question for the determination of the Government. The lands in controversy were surveyed by the Government in 1854 and returned as agricultural, but Secretary of the Interior Teller, in a communication to the General Land Office, speaks at large of the notations of surveyors, saying they are prima facie evidence only of the character of lands and subject to rebuttal by satisfactory proof of the real character of the land; and the determination of the real character of land is subject to revision by the Commissioner of the General Land Office, and an appeal from him by the Secretary of the Interior. And the rule to be adopted is that they will be considered agricultural or mineral according as they are more valuable in the one class or the other.

In view of the late increase in the development of California's oil wealth, the matter is of considerable importance. Judge Ross's decision checks and rebukes the wholesale effort to absorb the territory in question by perversion of what was intended to be a just and salutary law. The decision is favorable to the miner and commands respect.

In accordance with its usual custom of going into detail in all things affecting the mining interests, this paper in the earlier part of the present year published a complete exposition of the subject— "Scrip, and the Law of Title to Oil Lands"—which ran through the issues of April 7, 14 and 21, and gave the whole subject fullest and fairest discussion.

The lands in question have been withdrawn from public entry by the General Land Office; a U. S. judge has checked their spoliation. It is now in order for the real developers of the mineral wealth, the petroleum miners of California, to have suitable congressional action next winter. Nothing but alteration of the present law governing that subject, by the national legislature, will insure permanent relief from attempts at similar encroachment.

◆

Under date of Aug. 31st the U. S. Commission to the Paris Exposition of 1900 takes pleasure in informing the Mining and Scientific Press that, in accordance with the official announcement of the awards at the Paris Exposition, this paper is "entitled to use the award of grand prize." While, of course, the Mining and Scientific Press expected an award of some kind of "grand prize" at the Paris Exposition, yet, without desiring to detract in the slightest from courteous appreciation of the honor accorded this paper at Paris, it is not as highly valued as was the prize awarded to the Mining and Scientific Press by the World's Columbian Commission on the occasion of the World's Fair at Chicago, when a special award was made to this paper—the only one of the kind accorded to any journal exhibiting there, the award being in the official language of the Commission: "For the general reliability of its news and the clear and intelligent editorials therein. * * * * Favorably known for the fullness and accuracy of its weekly reports of the progress of mining." Probably when fuller reports come from Paris as to the manner of award, it may be that in the case of the Mining and Scientific Press the World's Fair at Paris has been as complimentary in its reference to this paper as was its predecessor at Chicago.

◆

On page 378 is an item from Cripple Creek, Colo., regarding the stealing of valuable ore by miners employed in the Elkton mine, which constitutes a very good advertisement for the mine in question, and recalls an unauthenticated statement regarding the sale of a mine in Shasta Co., Cal., some years ago, which was not of itself a gilt-edge proposition, but was being worked in the hope of possible profit resulting from development. In some way the story got out that the mine was being systematically robbed of ore by men in its employ, and one of the first things told to a prospective purchaser, brought there by the owner, was how shamefully the latter was being robbed, being too easy a man for such smart ore thieves as his superintendent employed. The sale of the mine was quickly made, and the stories regarding the alleged ore thieves as quickly ceased, there being apparently no further reason for their continuance.

◆

Looking through some old files of this paper and reading therein accounts of building and installation of mining and metallurgical plants that in their day were up to date, it is noticeable how archaic and far off it all seems now, though then they were considered quite the thing; and the thought naturally comes, when, in 1920, the present issues of this paper are looked into as dusty files of twenty years past, will the modern appliances now described seem so obsolescent as those of 1870 and 1880 seem now? The contrast emphasizes the advance and progress in mining and metallurgy.

◆

An interesting case comes up this week before the U. S. District Court for the northern district of California, being an application of the Government for an injunction to restrain the Mountain Copper Co. at Keswick from causing sulphur fumes or requiring it to put in some device to condense them. This course is taken to institute a suit for alleged damage to vegetation in the vicinity of the works. Such suit has long been threatened, and the matter might as well be made the subject of judicial determination now as any time.

◆

In January, 1898, in a magnificent way, was celebrated in San Francisco the fiftieth anniversary of the discovery of gold in California, and the event had commemoration commensurate with its importance. It was largely a celebration of the hydraulic mining of gold. In the present year occurs the fiftieth anniversary of quartz gold mining in California, a form of the gold mining industry that has not reached in California its fullest development and that will inure to the State's prosperity in a permanent and enduring manner.

Concentrates.

U. S. GOLD COIN is 21.6 carats fine.

COLORADO IRON ORE is largely used for flux by gold and silver smelters.

INTENDING visitors and others can have their mail addressed care this office.

IN silver production probably 10% is now produced by pan amalgamation and tank lixiviation.

THE Garretson copper smelting furnace was illustrated and described in the issue of Jan. 21, 1899.

A MINING CLAIM is a franchise from the people and should be either worked, patented or forfeited.

SILVER losses in cupellation are generally assumed to be due to absorption by the cupel, and volatilization.

THE amount of air required to consume in a gas engine 1000 cubic feet of natural gas of average composition is 10,870 feet.

THE shipments of lead concentrates from the Cœur d'Alenes during August is understood to have aggregated 15,300 tons.

A CUBIC FOOT of air temperature 56° F., barometer 30 inches, weighs .077 pound; at 80° F., barometer 31 inches, it weighs .076 pound.

THE underlying fact in the present action of the American Smelting & Refining Co. is a guarantee of $4 for lead produced during 1900.

CHEMICALLY pure zinc does not decompose water to any appreciable extent; commercial zinc is violently attacked by even slightly acidulated water.

THE Arizona law authorizing the recording of mining claims with the recorder of the county in which the claim is situated, went into effect July 1, 1895.

MERCURY will evaporate at any temperature above 42° F. Its low specific heat—.033° F.—is what makes it so extremely sensitive to changes of temperature.

IT is ultimately more satisfactory to have the ore valued by the smelter than by the assay returns, where quantity is more important than simple specimens.

THE Rand gold production has all along been given in crude ounces, as the gold comes from the plates or vats. United States gold production is given in ounces fine.

THE Government fee for the filing of certificates of improvements prior to the giving of Crown grants on mining claims in British Columbia has been raised from $10 to $25.

A CHANGE of temperature from 5° F. to —20° F. will cause a 30-foot 85-pound railway rail to contract .1 inch; a change from 5° F. to 70° F. will cause it to expand $\frac{1}{17}$-inch.

A "MINERS' INCH" is equivalent to one-fortieth of a cubic foot of water per second. It takes 4 miners' inches at 100 feet pressure to obtain 1 H. P.; that is, 6 cubic feet per minute.

ONE PER CENT carbonic oxide in air is liable to occasion death if inhaled. Gunpowder explosion and underground ignition of fuel produces this gas with insufficient ventilation.

WITH fairly good water it takes years to scale a boiler, but once scaled it will scale every three months or so, as the skin of the iron is gone. Kerosene or caustic soda is not recommended.

GASOLINE ENGINES are made that supply power at one-tenth of a gallon of gasoline per H. P. per hour. They are economical motors in any country, and invaluable where water is scarce.

EXPLOSIVES are only comparatively safe so long as they are treated as dangerous. To put this into practice is to approximately insure immunity from accident; to neglect it is to court disaster.

NO RIGHT can be initiated on government land which is in the actual possession of another by a forcible, fraudulent or clandestine entry thereon for the purpose of locating it as a mining or other claim.

A CUBIC FOOT OF LEAD ORE weighs 674 pounds. Thus a vein of galena, 1 foot wide, 6 feet high and 6 feet long (a fathom) will produce 16,582 pounds, or a vein $1\frac{1}{2}$ inches wide will net one ton to the fathom.

SO FAR as known the Belgian Government is the only one having an official rule that when men are being hoisted or lowered in a mine shaft a capable assistant is required to stand by the engineer to replace him in case of sudden indisposition.

CAREFUL sizing of pulp from batteries before sending it onto a concentrating machine gives good results. It is not reasonable to expect to save coarse and fine sulphurets on a single belt or table with an equal volume of water and the same grade.

WHILE it is not necessary that a locator should be the first discoverer of mineral upon the land, in order that a prior discovery by another shall inure to his benefit, and give validity to his location, it must have been known to and adopted and claimed by him.

WHERE a locator of a mining claim on government land fraudulently antedates his notice of location for the purpose of defeating an actual locator thereon, such location is fraudulent as against such rightful claimant, and it is also fraudulent as against the Government.

ANY journal published anywhere, any time can refuse to publish any advertisement and is not obliged to give its reasons. Probably the journal mentioned correctly concluded there was a certain style of patronage that it could not afford to take, considering the interests of its readers.

IN September, 1899, Cripple Creek, Colo., mine dividends aggregated $733,500; it is thought that the dividends for the current month will aggregate double that amount. In 1899 Cripple Creek mines paid a total of $4,354,402 in dividends. The 1900 total is estimated at $7,000,000.

ELECTRICAL underground concentration sounds attractive, and the idea is not to be condemned, but it would take great and expensive experimental work to demonstrate its economy. The one insuperable objection would seem to be the entailed watering and unwatering of the property.

CORROSIVE action of mine water on iron pipe is frequent. In some cases, as at the Stanley mine, Idaho Springs, Colo., the corrosion of the iron is attributed to the copper and ferric sulphate. In the case cited after a trial of iron, lead, copper, bronze and wood pipe, the latter was found most satisfactory.

THE plans of the Comstock Pumping Association are understood to mean even more than the mere unwatering of the flooded levels, which work is going steadily on. It is conceived that sinking the Osbiston or Combination shaft to a depth of 5000 feet would demonstrate the existence of large ore bodies at that depth.

IN smelting electrically, "black lead" or plumbago crucibles are used, the pot standing on a heavy copper plate connected to one pole of the dynamo, another copper plate acting as a cover for the pot and to which the other pole of the dynamo is attached. The heating of the charge is by radiation, as in a muffle furnace.

ALL money orders may be cashed at any money order office at which they may be presented, irrespective of the office on which they are drawn. In all cases the owner must be identified. At the office on which a money order is drawn the order must be cashed as soon as it is presented, even if the advice has not yet arrived.

ALL explosives containing nitro-glycerine freeze at a comparatively high temperature, are generally in a frozen state, and must be thawed before they can be of any use. How to make a simple and effective thawer has been repeatedly published herein. The Hendrie & Bolthoff Mfg. Co., Denver, Colo., make an excellent thawing device.

A CEMENT for a crack in an iron tank is made as follows: Five parts brimstone, two parts black lead, two parts sifted cast iron filings; melt together (taking care that the brimstone does not catch fire); have the crack absolutely dry; heat the damaged part with a red-hot piece of iron; heat the cement in a melting ladle till soft; then apply.

THE Supreme Court of the United States, in the case of Chambers et al. vs. Harrington (III U. S., 310) held "that when adjoining claims to mineral lands are held in common work for the benefit of all done upon one of them in a given year to the amount required to be done upon all in that year meets the requirements of Sec. 2324, United States Revised Statutes."

PLATINUM ore is a complex body, consisting of the metal in combination with varying proportions of other members of the platinum group, iridium, rhodium, palladium, ruthenium, osmium, with from 4% to 20% iron. Russia is the only country where platinum ore is mined. The Pacific coast platinum is found in alluvial deposits, generally associated with osmoiridium.

PROBABLY the best way to settle this whole public land question, including corporate absorption of the mineral area of California and other States, is for the Federal Government to turn all the public lands over to the States in which they are situated. Federal administration of public lands in this west half of America has rarely been right and has often approximated to fraud.

THE usual method of removing mill scale from forgings and plates is to place the iron in a solution containing one part of hydrochloric or sulphuric acids to ten parts of water, for from four to twenty hours. An electrical process with varying success is to use a solution of sulphate of soda, the plates to be cleaned forming a negative electrode and an iron plate the positive electrode.

AGRICULTURAL PATENTS obtained between 1866 and 1872 were granted subject to the condition of the extralateral right attached to an apex in adjoining mineral land. The right of the holder of a valid lode location to follow the dip of the vein into adjoining agricultural land has been passed on adversely by a U. S. circuit judge, but the question has never been decided by the U. S. Supreme Court.

IT is not unlikely that resumption of work in the South African mines will see successful effort to put in practice the proposition to sink to a depth of 8000 feet. Relay winding stations, electricity, the ingenuity of the American mining engineer, and the maker of American mining machinery will furnish successful solution to the problem, though it involve new questions in ventilation, pumping and hoisting.

PETROLEUM REFUSE has been successfully solidified for use as fuel. In one process about 10% of soda lye, with 10% fatty matter, is treated in a boiler, and enough petroleum refuse added to the heated mass to make 100 parts. This mixture is heated under constant stirring for one hour. The temperature is kept just under the boiling point of petroleum. In this incipient stage of saponification the mass acquires the property of taking up large quantities of oil. The mixture is run into moulds, cooled and cut into any desired form.

TO PUT a California mining location on record so as to protect the locator, in case of jumping, since the law of 1897 was repealed, in the absence of a local mining district and a recorder (as prior to the law of 1897), the Civil Code of California, Section 1,159, provides that all notices relating to mining claims may be filed with the county recorder, which will give the public due notice. A plain preliminary notice on a claim and recording, as stated, should give the locator protection.

LIKE all other accomplishments of modern civilization, machine tools in their present form are the result of a process of slow development; a machine does not spring full-fledged into being, but is gradually differentiated from the original type, gaining here and there a useful member and losing here and there a superfluous one. Many of our modern machines illustrate "the survival of the fittest" and adaptation to environment, changed and modified by a thousand years of trial.

GALENA introduced into a bath of molten anhydrous zinc chloride results in a double decomposition with the formation of zinc sulphide and lead chloride, any silver present being contained in the latter. Metallic zinc added to the melt will result in the formation of argentiferous lead, with the regeneration of a fresh quantity of zinc chloride. An alternate method consists in the leaching out of the zinc chloride and silver by water, leaving chloride of lead behind, which is ultimately to be recovered.

THE Supreme Court of California has decided that "an appropriation of water by means of a ditch is not measured by the capacity of the ditch, but is limited to such quantity, not exceeding its capacity, as the appropriator may put to a useful purpose; and no matter how great in extent the original quantity appropriated may have been, any amount less than the whole amount appropriated which has not been devoted to a beneficial use within five years is lost and forfeited as against a subsequent appropriator thereof."

IT has long been noted by millmen that amalgam contains more gold in winter than in summer. This has been ascribed to the warmer water in summer, making the amalgam more fluid; amalgam retorting 40% in summer may retort 45% in winter. Experiment does not conclusively demonstrate that there is a temperature at which the affinity of quicksilver for gold is at a maximum, but experiment does seem to show that in battery amalgamation there is a greater saving of fine gold at a temperature of 50° F. battery water than at a temperature of 60° or 70°.

A "LAID" ROPE consists of a core composed of a strand of either hemp or wire, around which are twisted six strands, each containing a similar core covered with six individual wires. A "formed" rope comprises six strands laid around a core as explained above, but each strand containing a larger number of component wires. Around the six strands above mentioned a further outside layer of twelve is laid, thus making eighteen strands in all, independent of the core. A "cable laid" rope consists of "laid" ropes closed together to form one cable, as in the ordinary hemp roping.

A MINING blacksmith and tool sharpener says: I used to temper drills to bore diorite. I half filled a bucket with clean water and spilled about a half a pint or more (if it was plentiful) of muriatic acid into it and mixed it thoroughly. I then warmed the drills just red, cooled them up about $\frac{3}{4}$-inch and let them come down to a straw color. I have seen a drill bore several inches tempered in this way, where half an inch would dull it if tempered in the ordinary way. It will help the boring considerably if camphorated turpentine is used instead of water to keep the bore wet. Camphorated turpentine is made by dissolving camphor gum in turpentine.

THERE are three ways of converting oxygen into ozone. If a stick of phosphorus be left in a closed bottle half filled with water for several days ozone will be found in the enclosed air. This is the chemical method. If a solution of sulphuric acid in water be electrolyzed with platinum or gold electrodes, ozone will be found at the surface of the anode. This is the electrolytic method. If electricity at high potential be discharged through air ozone will be produced. This is the electrostatic method. Whenever a frictional electrical machine is worked small quantities of ozone are evolved. It is produced for industrial purposes chiefly by the electrostatic method.

IN emery the abrasive material is crystallized aluminum oxide; in carborundum it is carbide of silicon. Although carborundum is much harder, its crystalline structure is less favorable for grinding than is emery. The crystals of carborundum are long and narrow, with few cutting edges and smooth faces, while emery crystals are nearly cubical and have rough surfaces. Perhaps the greater hardness of carborundum is offset by the better cutting properties of the emery. This is also indicated by the difficulty in keeping carborundum wheels from glazing when too much slag is used in making them. Emery has the advantage over carborundum for grinding or polishing purposes in all cases except where the finest grades are used. For the latter carborundum seems to be better.

Republic Sampling and Reduction Works.

Written for the MINING AND SCIENTIFIC PRESS by D. JACKLING.

The accompanying illustration* shows in a general way the design and arrangement of the sampling and reduction works of the Republic Consolidated Gold Mining Company, at Republic, Washington, which are now nearing completion.

The small building in the center foreground is the machine shop; the small building on the right is the assay office and laboratory, and the one on the left the storehouse. The main artery of the mine, No. 4 tunnel, runs under the right hand end of the mill. The mouth of it may be seen between the machine shop and assay office. A connection has been made, however, back about 100 feet, turning at right angles, and coming to the surface near the right hand side of the sampler, under the tramway from sampler to main mill. There are two other tunnels tapping the vein, at depths of 200 feet and 380 feet, respectively, the dump from the lower one of which is seen in the right hand background.

The plant is designed to handle 200 tons daily, and for several months after starting will draw its supply of ore entirely from the Republic mine, in order to absorb a large quantity of ore already mined and on the dumps, as well as an accumulation of tailings of several thousand tons from the old mill. When these accumulations have been used up, the works will take, in addition to the output of the Republic mine, sufficient custom business on the ores offered by other mines in the district to make up its full capacity, and provision has been made for easy enlargement of the plant to keep pace with increasing custom business and to accommodate all offerings. The plant is near the mouth of No. 4 tunnel, which is the principal opening to the Republic mine, tapping the vein at right angles to its strike at a depth of 600 feet, with a total length of 2500 feet. The sampling mill was located with a view to convenience for receiving ore from the No. 4 tunnel of the Republic mine, and from the mines in the upper part of the district by means of a surface gravity tramway, which will be built for that purpose by the time the mill is ready to receive custom ores. There is no suitable site for the large mill below the sampling mill, and it being located above, necessitates hoisting the crushed and sampled ores to the main crude ore storage, which is done by a self-dumping skip running on an inclined track, and operated by a small friction hoist located on the sampler, where its operator can also load the skip from a bin, under which the skipway terminates. The sampler is designed to handle 200 tons ore in ten hours, and will only be run on day shift until the mill capacity is increased. The storage bins will accommodate 600 tons of unsampled and a like amount of sampled ore—1200 tons in all. From the upper storage bins the ore is charged direct into a No. 5, style D, Gates crusher, passing which it is elevated to a revolving trommel, through which the fines pass direct to a set of 15x36 Gates high-grade rolls. The rejections from the screen return to a style H, Gates crusher, and to the screen again by way of the same elevator until it is fine enough to pass the screen to the rolls. Under the rolls, the first sample is taken by a Brunton sampler, the rejections going by elevator and shoots to either of the six lower storage bins. The sample is elevated to a small set of rolls and further crushed, after which it passes in succession two more automatic samplers, the rejections going to the storage bins, and the final sample to a small sample hopper in the adjacent sampling room. This sample is about 1% of the total ore crushed, and is further reduced to proper bulk by hand sampling, after necessary additional crushing and grinding. The sampling mill machinery will reduce all the ore passing through it to not coarser than ½-inch mesh, and this is done in order to avoid any coarse crushing machinery or roughing rolls in the main mill. The process to be employed in the mill is essentially fine, dry crushing, roasting, cyaniding with certain modification in detail, and precipitation with zinc dust. From the main storage bins the ore passes by gravity through two 26x5-foot revolving driers, to two sets 15x36 rolls, and thence to two sets 15x26, and is elevated by two elevators to a system of fine screens, consisting of three 8-foot by 48-inch hexagonal screens, and three 6x8-foot Jeffrey Columbian separators. The fines pass direct to storage bin over roasting furnaces, and the rejections to three 6x8-foot ball pulverizers, and from them again over the screens until required fineness is reached. The roasting plant consists of three straight-line furnaces, having a hearth area of 100x12 feet and a capacity of about seventy-five tons each. The ore falls from the 400-ton fine ore bins by gravity into the furnace feeders, and after being roasted "dead," is automatically cooled and discharged from them into a 300-ton storage bin above the leaching tanks.

The leaching and precipitating plant contains sixteen steel leaching tanks, 22 feet square by 6½ feet deep; two gold solution tanks, 14 feet diameter by 10 feet deep; one sump tank, 24 feet diameter by 5 feet deep; two precipitation tanks, 10 feet diameter by 8 feet deep, and three fresh solution and standardizing tanks, 14 feet diameter by 10 feet deep. All tanks are steel. The last mentioned three are located on a platform 12 feet above tops of leaching tanks, and all the other round tanks in the precipitating section, adjacent to the leaching room, but on a lower level. The precipitating section also contains four 24x36-inch section, all iron Johnson filter presses for collection of product; two Root rotary solution pumps, a triplex vacuum pump, and small engine to drive the whole. Leaching tanks are loaded by means of side-dumping basket cars running on two parallel tracks over each row of tanks. Tailings are discharged either by sluicing or shoveling into cars through four openings in the bottom of each tank. Steam power is used throughout, and the steam plant is located adjacent to the fine-crushing section of the main mill, and consists of six 60-inch by 16-foot return tubular boilers, having a combined capacity of about 500 H. P. The sampling mill, roasting machinery, precipitation department, machine shops and fine crushing department are driven by a separate engine for each. The main engine room, between the boiler house and fine crushing section, contains, besides the 180 H. P. Corliss for driving the fine crushing machinery and driers, a compressor for the mine and a 30 H. P. generator for lighting purposes. Each department was made independent in its motive power, both for convenience in operation at present and in order that electric power, which is contemplated for the near future, might be readily applied. Wood is used for fuel, both for steaming and roasting purposes. The mill will be equipped with dust exhausting and collecting appliances where needed to keep it as free from ore dust as possible. The extreme dimensions of the sampler are 96x63 feet and of the mill 315x280 feet. The gases pass away from the furnaces through 435 feet of brick flue, 8 feet square, to a steel stack 8 8 feet in diameter and 112 feet high. A fully equipped machine shop has been provided, as well as commodious blacksmith shops, assay office and laboratory, and storehouse. All the buildings are frame, the sampler and mill having corrugated iron roofs.

Blast Furnace Smelting.

The reduction effected in lead ore smelting is due to carbonic oxide, incandescent carbon, and, under certain circumstances, to iron, sulphur, and metallic sulphides. By far the most important of the reducing agents is the carbonic oxide, the action of which is modified by various factors, such as the interior shape of the blast furnace, its temperature, the blast pressure and volume, the tuyere area, the size and condition of the charge, etc. All these are sufficiently important to merit consideration. The reduction of carbonic oxide (carbon monoxide) consists in its power of robbing oxygen from a metallic oxide, thereby con verting itself into carbonic acid (carbon dioxide), and the metallic oxide into metal. As carbonic acid begins to dissociate at 1200° C., the reducing power of carbonate oxide can be active only at a lower temperature, such as exists at a certain height above the bosh or tuyere zone. The location of this height naturally depends on the interior shape of the furnace. If the bosh is contracted, the blast and the charge are there more concentrated, and accordingly a thicker layer of incandescent fuel is maintained between the unmelted charge and the molten slag. The carbonic acid, generated by the fierce combustion in front of the tuyeres, in the presence of an excess of oxygen, has to pass through this layer of glowing carbon, which, rapidly absorbing oxygen, converts the dioxide into monoxide. As the bosh contraction is passed and the area of the furnace is increased, the gases rise more slowly, and the carbonic oxide has plenty of time to absorb oxygen from the ore, oxidizing itself back into dioxide, and reducing the metals. On the other hand, the reverse takes place when there is no bosh contraction, but the furnace sides are kept straight. In this case both blast energy and charge are diffused over a wider area, consequently the layer of incandescent fuel through which the carbon dioxide ascends is thinner, less of the gas is converted into carbonic oxide, and the reducing action is, therefore, decreased. Tuyere area also affects the formation of carbonic oxide. Small tuyeres admit thin streams of air that are rapidly absorbed by the glowing coke with the evolution of carbonic oxide; large tuyeres, on the other hand, deliver more oxygen than can be absorbed by the fuel, and the gas formed is almost entirely carbonic acid, which mostly passes through the furnace as such. In the one case, therefore, the furnace atmosphere is reducing; in the other it is oxidizing. A third factor is the strength of the blast. A strong blast favors reduction, because the air pressure, forcing the carbonic acid formed in the tuyere zone into intimate contact with particles of the incandescent fuel above, even to the center of the charge, forms the maximum amount of carbonic oxide or reducing agent. A weak blast, on the contrary, does not penetrate so closely to the center of the charge, nor insure such intimate contact; and, in consequence, less carbonic oxide is generated. In connection with the strong blasts, it should be remarked that their use necessitates a greater height of ore column, respectively furnace shaft, otherwise there will be a waste of fuel by the escape of overheated gases, still capable of doing drying and roasting work in the furnace. The other determining agent is the quantity and fineness of the ore. Small charges favor better mixing of the ore and fuel, and therefore the more intimate action of the reducing gas on the charge. Fine ore, also, by impeding the draught, causes the carbonic oxide to more thoroughly permeate the charge in its efforts to escape, and so to remain longer in contact with the ore. Both causes tend to promote reduction.—C. C. LONGBRIDGE.

Catching Black Sand.*

Written for the MINING AND SCIENTIFIC PRESS by JNO. D. KING.

Noticing some questions in the MINING AND SCIENTIFIC PRESS of May 19, 1900, in regard to the saving of black sand and extracting the gold held therein, stirs interest in that class of work, as I have kept a vigilant search for several years for all that is being done in this line.

The river dredger placer machines offer better facilities for saving the gold-bearing silica and black sand than other placer machines, on account of their compactness, quantity of dirt handled and nature of their machinery. As so many dredging plants are not a paying investment, it would be well to look into the concentration of these sands, for, when some cheap and efficient means of saving the values they contain is found, no doubt many otherwise valueless placers will be dividend-paying propositions.

In 1898–99 I was dredge-master for the New Mexico Placer Syndicate on the Chama river, in Rio Arriba county, N. M., where an experimental dredger was built, and many tests were made with various devices for saving the values of the river placers of that district. Ordinary sluice-boxes with different designed riffles, and loaded with quicksilver, were first tried with no success; failure revealed the fact that the bright-looking gold was covered with a transparent siliceous coating, making the particles look twice their actual size. Forty assays were then made from the river material, ranging from the surface to 20 feet in depth, giving an average of 40% free gold, 40% in combination with the silica and 20% in combination with the black sand. There was 1.158% black sand of the material as it came from the buckets; and extracting it with magnets was tried with the result that only the magnetic iron was caught, and assays from this showed but a slight trace of gold.

The amalgamation idea was discarded and the boxes were provided with cocoa matting, expanded metal and devices with undercurrents. These gave little satisfaction, as the interstices would quickly fill up, letting the values run over and causing too frequent shut-downs.

All who are experimenting in this class of mining seem to be working in the same channel, viz., to save the black sand by a single operation—that is, by dumping the whole mass into a box, sluicing off the coarse material and saving the valuable silica and black sand as in washing gold; but I find the gravity of the silica too near that of the black sand to allow of such rough work. The Chama river people have been carrying on experiments in this line with undercurrent devices for the past ten months. The result is they find they must use screens, which, by sizing to one-fourteenth of an inch, will take off four-fifths of the material as it comes from the buckets, giving their machines much lighter work. By leaving their concentrates run 70% to 80% of the reddish silica, so manifest in the Chama, and which is the silica that carries the gold, they obtain a concentrate assaying from $35 to $60 per ton. While engaged with them, I built a revolving burlap concentrator that worked well; the interstices would catch the reddish silica, black sand and fine gold, and, as it revolved, the concentrates were washed into a hopper, leaving the burlap clear to be filled anew as it came in contact with the sluicing material. As before stated, they were looking for a device to do away with screening, which would condemn that class of machinery, as it could not handle such a vast amount of material; besides, the large boulders would not let it do good work and would knock it out quickly. Therefore, it was set aside to make room for other experiments. Where screens can be used, I do not know of another machine so efficient as one with a revolving burlap. I once tried bumping tables to bring a 6% black sand concentrate to 60% and found they were too slow and took up too much space to adapt them to placer work, as were also devices that required stopping and cleaning up every few hours.

As all placers have a peculiarity of their own, and necessary smelter facilities for treating the concentrates vary with locality, a slight modification may be required; but, in general, screening the material as fine as practical through a series of revolving screens, and running the fine material over one or more revolving burlap machines, according to amount handled and fineness required, to be determined by values in the silica and smelter facilities, is (from what data I can collect from the experiments of others and those of my own) the best arrangement for extracting the gold-bearing silica and black sand of the placers.

The Metallurgy of Zinc.

Written for the MINING AND SCIENTIFIC PRESS by DR J. OHLY.

There is no field of metallurgy so disheartening or disappointing from an economic point of view as the manufacture of zinc from its ores, considering the loss involved and the cumbrous and tedious mode of its production. In fact, the manufacture of zinc has preserved the same status, as to the principle underlying its production, which it held at the time of Albertus Magnus, (Albert von Bollstaedt), the great "Doctor Universalis," of whom contemporanean chroniclers of the thirteenth century report conclusively the following opinion: "It is generally admitted that Albertus was a God-fearing man of great erudition, and it is clearly proven that he never offended the dictates of the Church, or stood in league with the devil." Not so favorable was the judgment bestowed upon the forerunner of the iatrochemical school, Theophrast Bombast, of the fifteenth century, whose name seems to have lengthened with the expanse of his reputation, and to have evolved at the zenith of his glory into the title: Philuppus Aureolus Theophrastus Bombastus Paracelsus of Hohenheim, shortly known as Paracelsus in history.

It was this man Bombast who first introduced the application of metallic salts like those of mercury and copper, besides the dispensation of opiates, into medicine, and pointed out distinctly the production of zinc from its ores by the addition of charcoal and subsequent distillation. Though acknowledged as the precursor of the school mentioned above, he ranks necessarily with the alchemists, since he claimed in some of the passages of his writings to have discovered that mysterious substance known as "the philosopher's stone," and to have succeeded, merely by fusing a small particle of it with metallic lead, in transforming that base metal into shining aggregates of precious gold. Charlatan that he was, like the rest of his colleagues, he slyly kept a door open for escape, and remarked in some of his later publications that the preparation of the philosopher's stone, as well as the substance itself, were illusions, and that all those "adepts" who claimed to have compounded the same were deceptive characters and mendacious quacks.

To Paracelsus and his predecessor, Magnus, then, we owe the method yet applied to-day in the production of zinc, which has developed, after the gradual introduction of a few improvements, consisting in the greater number of vessels employed and the enlargement of the furnaces used, into the following modes of manufacture:

Of the processes known to have been worked on a commercial scale, the English and the Carinthian (Kaernthen, Austria,) methods—the latter a modification of the former—have been entirely abandoned. They comprised mainly the utilization of vertical retorts of fireclay, and the reduction of the roasted ore from the top to the bottom of the charge, under the addition of non-caking carbon, which operation necessitated an excessive consumption of fuel.

The Belgian and Silesian processes, however, represent "the survival of the fittest," and are serving at the present time in the Joplin district of Missouri, in Kansas, Indiana, and in Europe generally, for the reduction of the ore to the metal. The main difference between these two systems consists in the shape of the retorts, which have a cylindrical or elliptical form in the Belgian process, while they are muffle-shaped in the other. Since the height and length of the retorts employed in the Silesian process is greater than that of the vessels used in the Belgian system, their width being nearly equal, the charges of zinc oxide and carbon are necessarily greater in the first case, so that the production of metal for a given period is larger when operating the Silesian process than the output resulting on the application of the Belgian method. In recent years the tendency has prevailed to increase the number of retorts employed, which, in the Silesian process, are usually placed in a single row in the furnace and in the Belgian in tiers, so that a furnace receives nowadays a charge of six to eight tons for a single operation. Thus the distillation furnaces, operated at Iola, in southeastern Kansas, are generally elongated and double structures, fitted with 300 retorts on each side, which are arranged in five rows of sixty each. On the other hand, the furnaces at Cherryvale, Montgomery Co., Kan., situated also in the southeastern section of that State, and those of Indiana (which are fired by natural gas) contain 100 retorts per side, and are arranged in five rows of twenty each.

The loss experienced in the two systems varies between 15% and even 30% of the metal originally present in the ore, and it is generally assumed that the loss incurred by the Belgian method amounts to between 15% and 20% of the zinc, while the loss resulting on applying the Silesian system is calculated to be from 5% to 10% greater. This great loss in the last case is accounted for by the circumstance that poorer and more refractory ores are usually employed in that process.

The retorts and tubes, which latter are required for the purpose of joining the necks of the retorts with the nozzles, are manufactured in place by means of appropriate machinery, and the cost of their preparation forms a considerable part of the expenses incurred. The charging of these retorts requires great skill, and so does the firing, which is done either by the direct burning of coal or by gas, while the workmen watch carefully the different stages of the process. These are indicated by the varying color of the flames and vapors, which are gradually evolved, the first fumes given off being of a brown coloration and consisting of the yellow oxide of cadmium, accompanied by the appearance of the latter metal itself; the next, the characteristic, very intense bluish-white light of zinc vapors, which continues to show until the operation is completed.

The chemical reaction (I) involved in these operations appears to be very simple on paper, but great care must be taken during its practical application to maintain, by the proper addition of carbon, an atmosphere of carbon monoxide, CO, in the retorts, because else a secondary oxidation of the zinc formed takes place in presence of carbon dioxide, CO_2, as shown by the second equation:

$$\text{I.—}ZnO + C = Zn + CO.$$

$$\text{II.—}Zn + CO_2 = ZnO + CO.$$

Cadmium, which is a constant associate of zinc in its ores, accompanies the latter metal through all the stages of preparation or reduction concerned, and undergoes exactly the same reactions as zinc; but, being volatilized already near 865° C., while zinc vaporizes only toward 1000° C., the former metal makes its appearance first during the distillation process described above.

The ores employed for the extraction of zinc are almost exclusively zinc blende or zinc sulphide, generally known among miners as "black jack," and smithonite or zinc carbonate, the latter being rather rare, but readily reduced to oxide by burning in kilns, while blende requires careful roasting, so as to avoid the formation of difficultly decomposable sulphate, the operation lasting between two and six hours, according to the nature of the ore. It is essential that the ores used for smelting be as rich as possible, and also uniform in character, hence concentration, mostly performed by Frue vanners, is constantly resorted to. As the dressing works in the Joplin district turn out concentrates averaging 60% zinc, the value of the latter is readily calculated, since this percentage is equivalent to 1200 pounds of zinc per ton.

By the first of July of the present year zinc ore was selling in Joplin at from $25 to $26 per ton, while an ore of the same degree of concentration brought $44 per ton a year ago, and $55 per ton in April, 1898. This low price of the ore was, however, not caused by overproduction in the mining district, but more so by the manipulation of the market. Since the smelters are supposed to have driven down the prices to the lowest point possible, and the contents of the ore bins throughout the district have been practically bought in, while but one-half of the mines are producing at present, a rise of price has taken place during the past month.

A remarkable fact which may have escaped observation generally is the circumstance that zinc sulphides, or sphalerites, carry sometimes high values in silver, as the Mexican ores do, for instance, and that it is worth while to have them tested for the presence of this metal by the assayer.

It is quite evident that the only rational manner of ascertaining the value of zinc ores must be based upon their assay valuation, though it has been customary at Joplin for a number of years to have these values determined by inspection. These inspections were formerly made by men of much practical experience, generally natives of the district, who understood to closely judge the values of the ore by daily examining a handful of the product of the mills, comparing its appearance with that of the material of former days and taking in consideration the locality of the mines, besides the percentage reached by them previously. At present the work of these inspectors has been almost entirely replaced by the more reliable methods of the assayer, and the selling of the ore is mostly proceeded with on this basis. The character of the ore as to admixtures of foreign constituents is, however, also considered, when fixing the value of the ore, in a similar manner as is done with manganese or tungsten ore, brought on the market, for it is customary among the buyers at Joplin to deduct 50 cents per ton for each per cent of lead present in the ore and $1 for each per cent of metallic iron which the ore may contain above 1%. The smelting charges, including transportation and cost of smelting, amount to $10.50 per ton of ore, so that the present prices of $25 to $26 per ton leave a gross margin of about $15 per ton to the smelter.

Presenting briefly the several methods now in operation for the production of zinc from its ores, we have:

First.—The Silesian process.

Second.—The Belgian process.

Both are objectionable on account of the loss in metal occasioned by them, and the cumbersome character of the utensils employed for the reduction of the ore.

Third.—The electrolytic process, which has been found to be impracticable and too expensive, in spite of the numerous efforts made to improve it, so that no economic process of that kind is in operation at present.

Fourth.—The process proposed by the German chemists, Dr. Dr. Lungwitz and Dr. Schupphaus, of the Royal Polytechnic School of Berlin, whose scheme consists mainly in the production of metallic zinc in a blast furnace under a pressure of three atmospheres. It is based upon the generally acknowled principle that the boiling point of a liquid or liquid metal is lowered by the increase of pressure. The process is to be regarded, however, as an experimental venture only, as long as its practicability remains unproven by an actual test on the large scale, and it must necessarily appear that the maintenance of a pressure exerted during the course of reduction of the zinc oxide in a clumsy and voluminous structure like a blast furnace is combined with quite extraordinary difficulties.

Fifth.—The reduction process consisting in admixing powdered aluminum to metallic oxides, and taking advantage of the initial heat produced by the ignition of a small quantity of a mixture of barium peroxide and powdered aluminum, placed in proximity to the former.

It has been found that the metals chromium and manganese can be produced in almost chemically pure condition and free from carbon in this manner, though the costliness of the operation excludes it from application in the manufacture of other less valuable metals from their oxides, like zinc. The author has also found by actual experiment that the heat produced by the ignition of a small amount of barium peroxide and powdered aluminum, when placed upon an intimate mixture of zinc oxide and pulverized aluminum, is not sufficient to induce the reduction of the chemically pure oxide thus mixed and made use of in his experiments, and that no reduction to metallic zinc takes place even when the zinc oxide is mixed with both powdered aluminum and barium peroxide in varying proportions. A trial to reduce such zinc oxide, mixed with powdered charcoal, under addition of a small quantity of aluminum to start the reaction, by means of the heat obtainable in a muffle furnace used by assayers, gave also negative results, so that no satisfactory prospect lies in this direction.

Since neither of the practicable processes, enumerated above, give entire satisfaction, and, in fact, all of them leave much to be desired, an improvement of some kind would naturally be hailed with great acclamation and appreciation. If we, however, consider and examine the means at the disposal of the metallurgist, it will soon be found that there remains hardly another recourse than to resort to the application of the electric current; and that, to all probability, the solution of the problem will be best accomplished by mixing the oxide of zinc, into which form the ores of that metal are usually brought before treatment, with powdered charcoal, and subjecting the mixture to the effect of the electric current in a properly constructed furnace of large producing capacity. In this manner, it seems to the writer—and especially under the observation of the necessary precautions in preventing the vaporization of the metal by the addition of a protective layer of a dense slag, fused beforehand, and the maintenance of the lowest degree necessary to induce and sustain the reducing action of the charcoal—that satisfactory results may yet be in reach for the producer of zinc on an economic plan.

The Etard Chlorination Process.

The claim of the Etard chlorination process to public favor is the simplicity of preparation of the solution. It is known in its application as the permanganate process. The solution consists of an admixture of certain quantities of hydrochloric acid and permanganate of potash, or of sulphuric acid, salt and permanganate of potash with water. The cost of the solution when mixed in proportions for gold extraction purposes is stated to be about 1½ cents per gallon. Its application is as follows: In a vat of any shape or size with a depth of not less than 2 feet a hole is bored through one side near the bottom. A filter bed is laid down in the bottom, consisting of coarse gravel, to a depth of about 3 inches; finer gravel is spread over this and a layer of clean sand on the top. Upon this filter is placed the roasted ore to a depth of 1, 2 or 3 feet, according to whether the fineness of the material will allow the solution to pass through, or the depth of the vat will permit such a thickness. The solution is then run onto or poured on the ore and allowed to percolate through it and the filter, then through the previously mentioned vent and into a second vat placed below the outlet. This is allowed to go on for six hours, during the latter part of which time the solution escaping can, if possessing the characteristic color of the permanganate solution, be returned to the ore and allowed to percolate a second time. To find when the extraction is complete, a sample of the ore is taken from the vat, washed with water, then shaken up with some of the original solution and allowed to filter through a filter paper into a test tube. To this is added a little of a solution of sulphate of iron; and if, after the red color of the permanganate disappears, the liquid remains clear, the operation is complete;

if a blue tinge follows the disappearance of the red, there is still gold in the ore, and more solution must be added to it. When the gold is all dissolved, the remains of the solution still in the ore are washed out by pouring water on the ore and allowing it to percolate through into the vat containing the gold solution. There are several methods by which chloride of gold can be precipitated from the solution. In one a solution of sulphate of iron is prepared either by dissolving copperas in water, or by pouring sulphuric acid on scrap iron in water. The solution thus prepared is poured into the vat containing the gold solution. Any remaining red color of the permanganate immediately disappears and a bluish-green color takes its place. This color depends for its intensity upon the quantity of gold held in solution, the pigment being the gold itself—no longer in a state of solution, but one of suspension in the liquid. The gold is now in a state of molecular division—too finely divided to be visible to the naked eye except by the hue it gives to the liquid, but yet sufficiently palpable to gradually sink to the bottom of the liquid if sufficient time is given. In twenty-four hours the whole of the gold will be deposited at the bottom of the vessel as a black slime, and the liquid will be gold free. The liquor is then run off or decanted and the slimes are roasted in a porcelain dish to drive off the moisture, then mixed with fluxes, placed in a crucible and melted. The resulting ingot is fine gold.

A Coal Conveyor.

The handling of run of mine coal, without breakage, at the rate of 150 tons per hour is a matter which coal operators will be interested in, especially those working veins on high levels.

The illustration herewith is a view of one of the Jeffrey wire rope retarding conveyors now used by the Dayton Coal & Iron Co. of Dayton, Tennessee. It is practically 500 feet in length and carries run of mine coal from the upper level to the tipple and cars located below. The carrying side of the conveyor is lined with heavy sheet steel, in which the cable with its special flights operates. The coal is fed into this runway and is carried along on the horizontal plane by the conveyor flights, while on the incline the same flights simply act as a check to keep the coal from running away.

A small engine is used to start the conveyor. This system is inexpensive in its first cost, has large capacity and is continuous in its operations; the cost of maintenance is slight.

It is replacing the tram car system in some places, which indicates its value where the merits of this type of lowering coal are known. For catalogue address the Jeffrey Manufacturing Co., Columbus, Ohio.

THE production of crude petroleum in California in 1899 was 2,642,095 barrels, valued at $2,508,751, about 95 cents per barrel. As compared with 1898, there was an increase of 384,888 barrels in production and 10 cents in the average price per barrel. Los Angeles county, which takes first rank in the amount of production, produced 1,398,690 barrels, valued at 95.3 cents per barrel. Out of the total quantity produced in Los Angeles county, 1,022,966 barrels, valued at $960,726, or 93 cents per barrel, were produced in Los Angeles. The other counties of California which produced petroleum, ranged according to their output, were: Ventura, 496,200 barrels; Fresno, 439,372; Santa Barbara, 208,370; Orange, 108,077; Kern, 15,000.

EASTERN REPORTS agree that the American Telephone & Telegraph Co. (which now includes the American Bell Telephone Co.), the Telephone, Telegraph & Cable Co. of America, the Western Union Telegraph Co. and the Postal Telegraph Cable Co. will consolidate into one big company to be known as the National Telephone & Telegraph Co.

"Pure Water is a Poison."

This is the startling proposition put forward by Dr. Koppe in an article in the Deutsche Medicinische Wochenschrift. He says:

By "chemically pure water" we usually understand perfectly fresh, distilled water, whose behavior and properties are well understood. It withdraws the salts from the animal tissues and causes the latter to swell or inflate. Isolated living organic elements, cells, and all unicellular organisms are destroyed in distilled water—they die, since they become engorged therein. They lose the faculty, upon which life depends, of retaining their salts and other soluble cell constituents, and consequently these are allowed to diffuse throughout the water.

Distilled water is, therefore, a dangerous protoplasmic poison. The same poisonous effects must occur whenever distilled water is drank. The sense of taste is the first to protest against the use of this substance. A mouthful of distilled water, taken by inadvertence, will be spit out regularly. The water once in the stomach, the superficial stratum of epithelium experiences a powerful distension, the cells are leached by their salts, die, and are cast off. This local poisonous effect of distilled water makes itself known by a sensation of uneasiness, belching, etc., furnishing all the symptoms of a catarrh of the stomach on a small scale.

The harmfulness of the process, so much resorted to to-day, of washing out the stomach with distilled water, is acknowledged, and we find the physicians who formerly used that agent are now turning to the "physiological solution of cooking salt," or "water with a little salt," or the mineral waters recommended for that purpose. The poisonous nature of absolutely pure water would surely have been recognized and felt long since, were it not that its effects, in their marked form, can seldom occur, for through a train of circumstances, "absolutely pure" water can rarely be found. The ordinary distilled water, even when freshly distilled, is not really absolutely pure, while that used in the laboratories and clinics is generally stale, has been kept standing in open vessels, generally in rooms where chemicals of every sort abound and whose gases and effluvia are taken up by the water.

The relative purity of samples of distilled water is best determined by the electrical conducting power of each, since the latter rises regularly and uniformly with the increased impurity of the sample. The purest water has but a small conductive power, since water is readily decomposed into hydrogen and hydroxyl (H and OH). To illustrate this fact, let us examine some investigations of Oswald and Koppe (the author), in which the numerals represent ohms multiplied by 10^{10}.

Oswald used in his physical work water with the conductive index of 2.13. A similar water was obtained by Kohlrausch and Heidweiller by melting natural ice.

Koppe obtained, by melting natural ice, a water with 8 as an index of conductivity. Ordinary distilled water gave 49.2, and ice prepared from distilled water which had been boiled gave, on melting, 1 with the index 10. The following are the indices of certain German waters:

Gasteiner Giftbrunnen ("poison springs")	31.9
Water from artificial ice	137
Vienna, public mains	220 to 239
Giessen, public mains	296
Selterswater, natural	5.700
Salt, solution 0.73%	11.050
Salt, solution 1.46%	20.038

"Water melted from natural ice," proceeds Koppe, "was purer than even boiled distilled water. Our patients are delighted when we get for their use this transparent and brilliant ice, and we (as physicians) think that surely nothing can be safer than water melted therefrom—but many a belch comes from the stomach of the patient allowed to hold a bit of the ice in his mouth and swallow the water. If this process is permitted for any length of time we hear complaints of 'weak stomach,' 'catarrh of the stomach,' etc., which we must charge up—solely to the purity of the water!

"And here it is all the worse. In the mouthful of 'pure water' taken inadvertently in the laboratory, as stated, the sense of taste comes to our rescue, and we spit it out, but here the sense of taste is benumbed by the cold."

This explanation seems to be all the more reasonable when patients with hitherto healthy stomachs, who, after operations, are for any reason allowed to swallow "ice pills," begin to belch, and not infrequently contract catarrh of the stomach. There are well known sequelæ of the use of ice, but up to the present no reasonable hypothesis has been offered as to the etiology of the same. It has been charged, it is true, to the "bacteriological contents" of the ice, but examination of the latter has demonstrated it to be almost free from bacteria such as would account for the phenomena, though otherwise frequently containing bacteria. As a remedy our clinicians say we must use only artificial ice, made from distilled water. Well, it is possible that artificial ice may be better borne than the natural, but it is not because it is purer than the latter, but exactly the contrary. It is simply because the melted water thereof more closely approaches our ordinary drinking water.

This point in the care of the sick, which is certainly worthy of investigation and explanation, finds its analogy in the daily experiences of the traveler in high mountainous regions. The guide books warn him against quenching his thirst with snow and glacier water, and the waters of the mountain brooks as well, for, in Germany, these not only do not quench thirst, but give rise to much discomfort. With the greatest possibility of being correct, we may assume that snow and glacier water are of the highest degree of purity, approaching distilled water very closely, or, indeed, excelling it in purity (see the index of electrical conductivity of the Gasteiner Asche above—only 31.8, even less than the ordinary distilled water. The index of the Housbrunnen in the Kurhaus at Provencheres, in Gastein, is only 31.6).

The harmfulness of glacier water, like that of the pure, cold mountain brooks, most of which, indeed, spring from glaciers, arises from the fact that they are exceedingly pure waters and produce identically the effect of the use of distilled water—they are poisonous. The supposition that the coldness of the water causes the sick, uneasy feelings cannot stand for a moment, though this coldness is very probably the reason that its unfitness for use is not at once recognized and the liquid rejected.

The last link in our chain of prolegomena is found in the case of another of the Gastein springs. The water of this spring has an electrical conductivity of 31.9, therefore far excelling ordinary distilled water in this respect, and hence, according to our proposition, its use should demonstrate the poisonous nature of pure water. By a most strange coincidence, from the oldest times, for hundreds and hundreds of years, this spring has been known as the gift-brunnen—the "poison spring." Its water is never drank; it is commonly regarded as poisonous, although no chemical examination of it—and they are almost innumerable—has yet been able to detect the slightest trace of any poisonous substance. Its poison lies in the fact of its extreme purity! This, we know, is a proposition that nobody will take in earnest—still, it is devoid of anything wonderful in a physiological point of view, and, furthermore, it is borne out by fact.

American Miners in Korea.

Thos. Woon of Nevada county, Cal., has returned from Korea and tells the Union that developments are under headway and show Korea to be rich in mineral wealth. The operations at present are confined chiefly to gold mining. The gold is found in quartz ledges from 1 to 17 feet in thickness, generally rich from the outcroppings down. The mines are old ones, partially developed, and appear to have been worked for centuries past. The natives never worked them below the water level, having no pumping machinery or other appliances for removing the water. The advent of American machinery and modern methods have changed affairs and the richer deposits are now being worked successfully. No prospecting for locations is necessary, as the old shafts made by the natives are taken as indications of paying ledges. The land is owned by the Government, and an American who wishes to engage in mining secures a concession through the resident consul, something which is easily accomplished with proper representations and the payment of certain sums for the privilege of mining.

The Oriental Con. M. Co. of New York is mining on a large scale at a point about 300 miles in the interior, with good results. This company employs 1500 Koreans and a few Chinese in the mines, also about forty Americans or Europeans, who act as foremen or bosses. The white men employed are usually miners who have had experience in mining elsewhere. The milling is done on the ground, excepting a small quantity of sulphurets, which is shipped to the smelting works in San Francisco. The machinery and large quantities of mining supplies are shipped from San Francisco to Nagasaki, Japan, and are then transferred to a small steamer, which carries them to the Korean coast. They are taken up an inlet and a river far into the interior and landed a few miles from the mines. Bull carts and ponies are then used for freighting from the landing to mining headquarters. A considerable quantity of canned goods and provisions come from London to supply the wants of the white men engaged in the mines.

The New York company, of which J. Sloat Fassett is a large stockholder, is managed by Leigh Hunt, who gained a concession and interested capitalists in the proposition. Now the property of the company is valued at high figures. The Chittibalbi mine is one of the best of the group.

The climate of Korea is dry, the heavy rains falling in July and August. The winters are cold and the mercury often registers 25° below zero. The inhabitants are mild-mannered, peaceable people, and it is safe to travel anywhere. The foreigners carry firearms and the Koreans are afraid of them, knowing that they have the protection of the Korean Government at present. However, there is a hatred of the foreigners, and if the natives were encouraged they would attempt to drive them out of the country. In case the Chinese trouble should spread, or Japan and Russia engage in a general war over Korea, the ports would be blockaded and the safety of Americans and Europeans might be endangered.

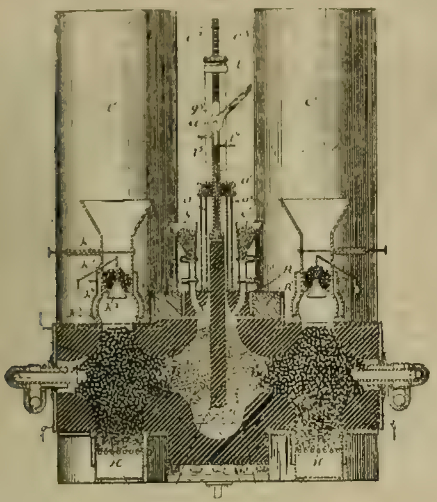
There are no railroads in the vicinity of the mines, and no newspapers are published. Bulletins are posted occasionally at headquarters, however, giving news from the war. It is a cheerless country in which to live, though thickly settled by natives.

Mining and Metallurgical Patents.

Patents Issued September 18, 1900.

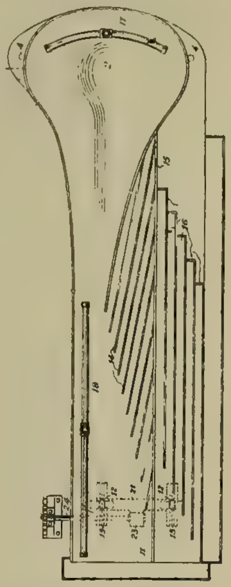
Specially Reported for the MINING AND SCIENTIFIC PRESS.

ELECTRIC FURNACE.—No. 658,315; A. H. Cowles, Cleveland, O.



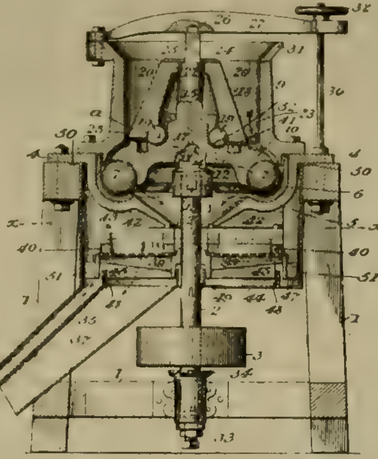
Combination in furnace, of electric smelting chamber having electrodes and electric circuit connections therewith, two or more fuel chambers with electric smelting chamber interposed between them, communicating flues therebetween, a blast mechanism for causing flow of gas through series of fuel chambers and electric chamber, and reversing mechanism for gas flow, whereby ore or other material in electric smelting chamber can be preheated by regenerative gas flow.

CONCENTRATOR.—No. 658,120; J. W. Pinder, Groveland, Cal.



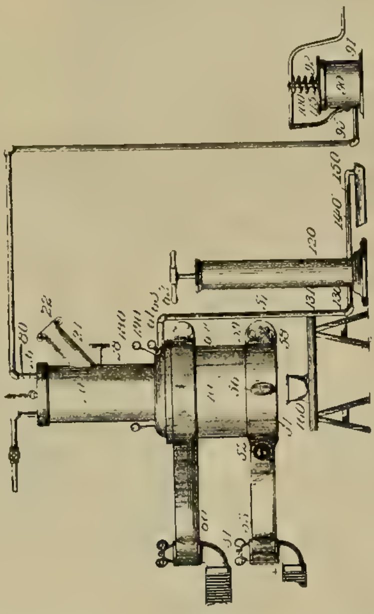
Concentrating table consisting of rounded head having bottom sloping toward central point and surrounding rim, lower end of table forming continuation of bottom into which it merges, lower end approximately flat and inclined longitudinally, also transversely, with rim upon upper edge, pipes by which water is delivered into head portion and along sides of lower portion, tapering rib connecting with rim of head portion and extending toward lower end, approximately parallel with discharge side of table, tapering riffles having deeper ends contacting with tapering rib, diverging toward center of table, other tapering riffles exterior to rib, approximately parallel with side of table, troughs at lower discharge side and end respectively to receive materials separated upon table and means whereby rotary motion of head and longitudinal movement of lower end of table are simultaneously produced.

CRUSHING AND PULVERIZING MACHINERY.—No. 657,933; T. R. Goth, San Francisco, Cal.



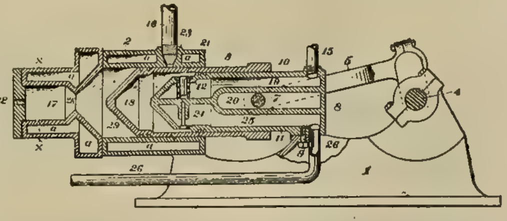
Combined crushing and pulverizing machine, superimposed gyratory muller supported on and actuated by rolling balls, mounted in revoluble member having inclined eccentric raceway on top and concentric groove or guide for pulverizing balls on bottom, these race or guide ways of different radius to give upper and lower balls oblique position in line of pressure and in respect to axis of revolution, two sets of balls therein opposing each other, exerting oblique force on gyrating muller; the revoluble member 10 having inclined and eccentric raceway on its top for balls 19, a concentric way or groove on its bottom to receive pulverizing balls 7, stem 15 and adjustable means for applying pressure on stem, thereby to pulverizing balls 7.

APPARATUS FOR SEPARATING METALS FROM ORES BY ELECTRICITY.—No. 657,911; G. D. Burton, Boston, Mass.



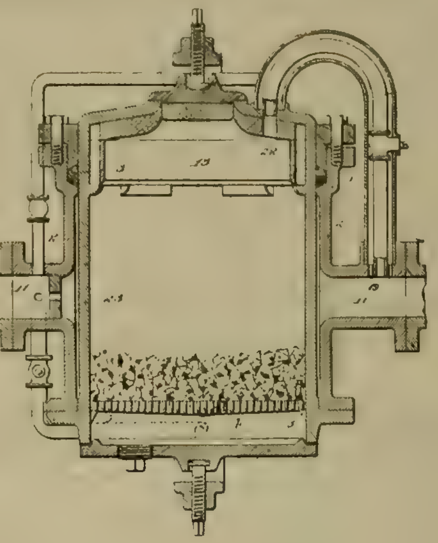
In an electric furnace, combination of reducing chamber composed of conductive material, having stack provided with means for feeding ore, chamber provided with exterior flange, electrode comprising clamp adapted for contact with chamber near top and under flange serving as support for chamber, electrode adapted to serve as bottom for chamber, means for passing large heating current through electrode.

REAR COMPRESSION GAS ENGINE.—No. 657,934; G. E. Hoyt, San Francisco, Cal.



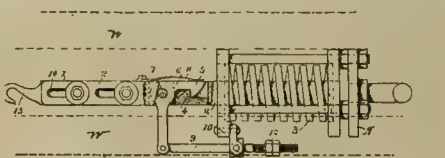
In gas engine, main cylinder, trunk pinion movable therein, forming combustion chamber between two, extension 17 to combustion chamber in which ignition takes place, a fixed trunk piston extending within movable piston forming a compression chamber between two latter, fixed piston being divided into two chambers or passages, gas inlet to one passage 19, gas outlet from other passage 25 to combustion chamber, valve opening from passage 19 to compression chamber, and valve opening into passage 25 from compression chamber.

APPARATUS FOR REHEATING COMPRESSED AIR FOR INDUSTRIAL PURPOSES.—No. 657,922; T. A. Edison, Llewellyn Park, N. J.



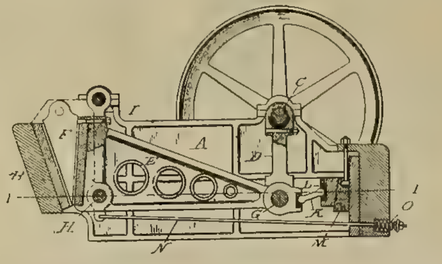
Apparatus for heating air, comprising pipe supplying compressed air from source of supply to translating device, reheater in pipe for heating the air by radiation, solid combustible in the heater, by-pass including reheater for permitting portion of air to pass through reheater to support combustion and to be heated directly, means to permit drop in air pressure between inlet to by-pass and translating device to automatically cause air to flow through by-pass in quantity depending upon consumption at translating device.

MANUFACTURE OF FLAT WIRE CABLE.—No. 658,118; E. I. Parsons, San Francisco, Cal.



Tension-regulating device comprising slidable bar having hook at one end, spring-pressed latch-lever fulcrumed to other, shank with relation to which hook-bar is guided and slidable, shank having catch with which latch-lever is adapted to engage, frame or yoke with relation to which shank and connected nook-bar are slidable, spring and handle through which pull is exerted thereon and rod having one end connected with latch-lever and carrying adjusting nut or like stop with which frame contacts when spring is acted upon by pull and required tension reached whereby latch is disengaged and hook-bar allowed to slide upon its guide.

CRUSHING MACHINE.—No. 658,071; E. Reynolds, Milwaukee, Wis.



In crushing machine, combination of main frame; fixed jaw; jaw F carried upon forward end of frame E; links I pivoted to upper part of frame and likewise connected to lower forward part of frame E; eccentric mounted upon frame; link D connecting eccentric and rear end of frame; link K bearing against fixed portion of main frame and rear end of frame E, being in line with pivotal points of movable frame E when link is in its position of greatest thrust.

ABOUT $100,000,000 worth of india rubber has been imported into the United States during the past four years, and about $60,000,000 worth in the last two years. Ten years ago the annual importations of india rubber amounted to about $15,000,000; now they exceed $30,000,000, and are steadily increasing. Practically all of the importations of rubber come in crude form for use of manufacturers. Northern Brazil, southern Mexico, the West Indies, Central Africa, India, the Straits Settlements and the Dutch East Indies supply this increasingly important feature of our importations.

To Splice a Wire Rope.*

The only tools needed are a cold cutter and hammer for cutting and trimming the strands, and two "needles" 12 inches long. These latter are made of good steel, ½ inch thick at one end, tapered ovally to a point, and having a handle riveted on, as shown in Fig. 3.

When the rope is cut and ready for splicing, unwind three strands of each part 15 feet, keeping them together and not separating them. Now cut out the hemp center to the point x, as shown in Figs. 1, 2 and 3; rewind the strands for 7 feet to A, and cut off three of them from each end of the rope at A, A, Fig. 1. Then, as shown in Fig. 1, from x to A the rope is without a hemp center. Draw the two ends A together, letting B, B pass, as shown in Fig. 1; uncoil the strands e, d, c, Fig. 2, keeping them together, and follow immediately with the long strands e′ d′ c′, holding all the strands firmly and keeping them together so that the three long strands e′, d′, c′ will take the place of the short strands e, d, c; next, do the same with the strands f, a, b, keeping them together as before, and laying them in the places from which f′, a′, b′ have been uncoiled. Take about two turns around the rope with these; the operator will then find that the rope is united and round, as shown at Y, Fig. 3. Now take the short strand a′, Fig. 2; unwind it, and follow with the long strand a, making two wraps or turns around the rope; then unwrap the short strand b′, and follow it with the long strand b, making the long end fit in the place previously occupied by the short strand of the same letter; do the same with f, e, d and c, until the last strand reaches x, Figs. 1 and 3, at the two ends of the splice. By following these directions closely it will be unnecessary to tie the strands, as each strand locks the other, and there is no danger of entanglement if care be taken that the strands follow one another in their natural order.

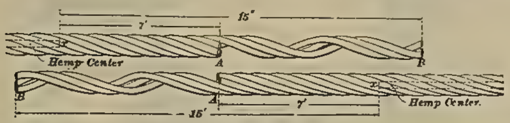


FIG. 1.

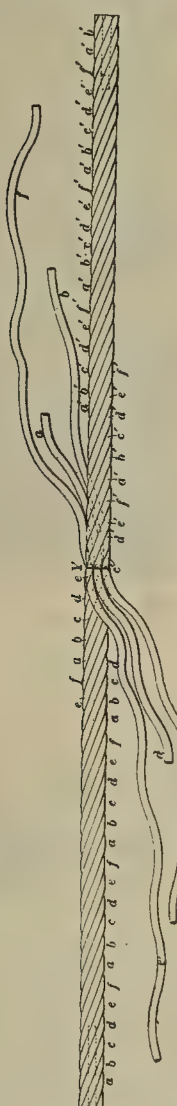

FIG. 2.

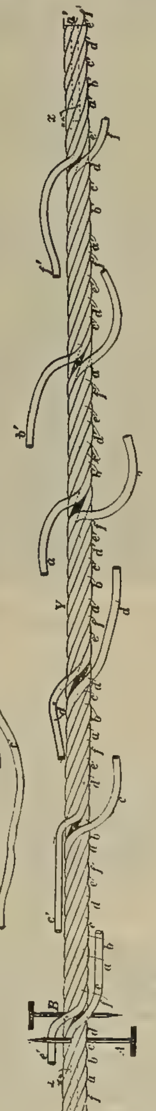

FIG. 3.

After cutting off the ends of each strand the rope will have the appearance shown in Fig. 3, where, if the ends were tucked in, e′ would butt against x, e against c′, c against d′, d against a′, etc. The next operation is to run the strands into the middle of the rope. To do this push the needle A, Fig. 3, through the rope from the under side, having three strands in front of the needle and two at the back, the strand e being back of the needle. Push the needle B through from the upper side, having the strand e in front of the needle; push the needles as close together as possible with the strand e between them; place the needle A on the knee and hold it there firmly, then turn the needle B around the coil of the rope, forcing the strand e′ into the center of the rope. Continue similarly with all of the strands, and should any of them seem too full tap them lightly with the butt end of the needle, which will round them off and fix them into place. All of the strands should meet as nearly as possible in the center, as they take the place of the hemp center, and this will keep the rope round and prevent the slipping of the strands.

The splice as thus made may seem at first somewhat rough, but a little use of the rope will overcome all irregularities. A beginner should make several splices on a rope that is not in use. If the above directions are followed, after a little practice any man can make such a splice in thirty minutes, and if pushed it can be done in twenty minutes; but this requires two men, one coiling and uncoiling, while the other follows up with needles and cold cutter. To do this the hemp center must be left out, as shown in Fig. 1.

A new rope, owing to the wild character of the strands, must have the hemp center left in; otherwise the operation is the same, excepting that, when ready to run in the strands, the needle is pushed through at x, Fig. 3, and turned so that its broad side will be at right angles to the rope; cut the hemp center and pick out enough of the center by turning the needle around the coil of the rope to let in the strands e′ and e; put in e′ and e, and then push the needle through at the end of the strand e, taking out enough of the hemp center to put in the strands c′ and c; continue this until all the strands have been entered. With a new rope it will take one hour to make the splice.

---

Metric System and Equivalents.

MEASURES OF LENGTHS.

1 millimeter = 0.001 meter = 0.0394 inch.
1 centimeter = 0.01 meter = 0.3937 inch.
1 decimeter = 0.0 meter = 3.937 inches.
1 meter = 1. meter = 39.37 inches.
1 dekameter = 10. meters = 393.7 inches.
1 hectometer = 100. meters = 328 feet 1 inch.
1 kilometer = 1000. meters = 3280 feet 10 inches.
1 myriameter = 10000. meters = 6.2137 miles.

MEASURES OF VOLUMES.

1 milliliter = 0.001 liter = 0.061 cubic inch.
1 centiliter = 0.01 liter = 0.6102 cubic inch.
1 deciliter = 0.1 liter = 6.1022 cubic inches.
1 liter = 1. liter = 0.9081 quart.
1 dekaliter = 10. liters = 9.081 quarts.
1 hectoliter = 100. liters = 2 bushels, 3.35 pecks.
1 kiloliter = 1000. liters = 1.308 cubic yards.

WEIGHTS.

1 milligramme = 0.001 gramme = 0.0154 grain.
1 centigramme = 0.01 gramme — 0.1543 grain.
1 decigramme = 0.1 gramme = 1.5432 grains.
1 gramme = 1. gramme = 15.432 grains.
1 dekagramme = 10. grammes = 0.3527 ounce.
1 hectogramme = 100. grammes = 3.5274 ounces.
1 kilogramme = 1000. grammes = 2.2046 pounds.
1 myriagramme = 10000. grammes = 22.046 pounds.

METRIC AND ENGLISH EQUIVALENTS.

Inches millimeters ÷ 25.4
Feet = meters × 3.28089
Yards = meters × 1.09363
Miles = kliometers ÷ 1.6093
Sq. In. = sq. millimeters × .00155
Sq. Ft. = sq. meters × 10.7643
Acres = sq. kilometers × 247.114
Cu. In. = cu. centimeter ÷ 16.3862
Cu. Ft. = cu. meters × 35.31658
Lbs. avoidupois = kilogrammes × 2.2046
Tons (2000 lbs.) = kilogrammes ÷ 907.18
Lbs. per foot = kilo. per meter × .67196
Lbs. per cu. ft. = kilo. per cu. meter × .06243
Sq. millimeters = square inches × 645.137
Square meter = square feet × .0929
Grammes = ounces × 28.4595
Grammes = pounds × 453.5926
Kilogrammes = pounds × .45359

Mixing of Concrete.

The following account of the mixing of the concrete for the piers of the new ship canal at the entrance of Duluth Harbor, Minn., is of interest, showing the careful way in which the work was done, and is from a report of Major Sears, W. S. of the Engineer Corps.

"The mixing was done on movable platforms, which were always placed alongside the molds to be filled. Mixing on the molding platform was prohibited, to insure the preservation of a smooth molding surface for the base of the blocks. The pebbles were always thoroughly washed, and while moist from the washing were transported in measuring carts of one-half cubic yard capacity each to the mixing platform, dumped and spread to an even thickness of 6 inches. The sand was spread on the pebbles in a like manner, and the cement, after being weighed, was spread on top of the sand and pebbles. After a thorough mixing dry, the mixture was again spread out on the platform to an even thickness of 6 inches, and water was added carefully, the mixing proceeding as the water was being applied, and continuing until the mass was in such a condition of plasticity that five or six sharp blows from the back of a shovel would produce a glistening appearance upon the surface of the concrete so treated. The concrete was then immediately shoveled into the molds, and, after being spread in layers not more than 5 inches deep, was thoroughly rammed with iron rammers having a face area of 25 square inches and weighing forty pounds each. Special flat rammers of oak shod with ½-inch steel were used for compacting around the sides of the mold. No attempt was made to provide special material for the surface of the block, a smooth and handsome appearance being accomplished by thorough ramming of the concrete. The batches as mixed contained each one cubic yard of pebbles, one-half cubic yard of sand and 432 pounds of cement. As indicated above, the pebbles and sand were accurately measured and the cement was always weighed."

Some Facts About Steel.

The term steel signifies iron containing a small percentage of carbon, which may vary from less than 1% to 15%. In modern times steel signifies iron that has an infinitesimal amount of carbon in it, provided it is produced by the open hearth or Bessemer process.

Meteoric iron is a close representative of nickel steel, and was used by the ancients. The majority of steel in the early times was obtained from wrought iron. Wrought iron is produced from cast iron melted in contact with iron cinder and iron ore, and, when cooled and worked, again heated in closed vessels with shavings of horn and similar material.

The most important invention in connection with the production of steel was that of Sir Henry Bessemer and termed the Bessemer process. The Bessemer process dates back to the fifties. The essence of this invention was the production of steel from pig iron by the use of an air blast. A blast of air is forced through the molten cast iron so that the carbon and silicon contained in it are burned out, they forming the fuel. The converter in which the metal is treated by the Bessemer process is an egg-shaped vessel having a capacity of several tons, which is turned on its side to receive the charge, and afterward brought into an upright position. Its bottom is full of holes, through which the hot air blast is forced.

Steel under the intense heat of a converter is as liquid as water. In 1878 a great advance was made in the art by Sidney G. Thomas, by which ordinary grades of iron ore were rendered available for steel making. The Thomas invention related to the addition of a quantity of lime to the charge, and the lining of the converter with special bricks formed of lime, which absorbed the phosphorus in the cast iron. The slag obtained by the Thomas process is found to be rich in phosphorus, and is used largely as a fertilizer. The Thomas improvement is considered the greatest yet made on the Bessemer process.

Following the Thomas discovery, the next important improvement in the process was that made by William Siemens in 1882, which consisted in burning the fuel so as to produce a gas which was burned in a peculiar furnace, obtaining thereby high temperature and great economy of heat.

The tenacity of good steel is very high, exceeding that of any other metal. The fractured surface of steel generally presents a crystalline appearance, uniform in strength. Much carbon makes steel close-grained and lustrous. Natural steel is obtained by refining cast iron so as to deprive it of a sufficient portion of carbon to bring it to a malleable state. Indian or Wootz steel is made by melting one pound of malleable iron in a crucible with 10% by weight of the wood and leaves of the plant Cassia ariculata. Mild steel contains from $\frac{2}{10}$% to $\frac{5}{10}$% carbon. When more is present it is termed hard steel.

Steel in its hardest state is too brittle for most purposes, and the requisite strength and elasticity are obtained by tempering, which is performed by heating it to a certain color, dependent on the use to which it is to be put, and cooling quickly. The tensile strength of steel ranges from 75,000 to 96,000 pounds. The average is about 86,000 pounds. A hemp rope 16.5 inches in circumference would be the equivalent to a steel rope 5 inches in circumference.

A Celebrated Case.

TO THE EDITOR:—Referring to your issue of Sept. 1, 1900, under "Concentrates," in an article in regard to dip of veins, it is stated that, under certain conditions, the side lines of a claim may become end lines. I would like to know, if convenient (and if you should possess the information), a reference to the title of the case upon which the article is founded, so that I may refer to it.

Portland, Or., Sept. 20.

The case of the Del Monte M. & M. Co. vs. the Last Chance M. & M. Co., decided by the U. S. Supreme Court. The entire decision, as furnished this paper officially from Washington, D. C., comprising about 14,000 words, with illustrations, appeared in the issue of July 2, 1898.

MINING SUMMARY.

ALASKA.

Miners have penetrated the rim rock of Last Chance basin, near Juneau, with a tunnel which strikes the basin 86 feet below the surface. The gravel carries gold.

The American G. M. Co. of Juneau has leased its mines at Sheep creek to F. Hammond, formerly Supt. of the property.

The Gold Digger, published in the staid and steady town of Nome, says the Koyukuk stampede is founded on fraud, and gravely warns the outside world against bad boomers.

ARIZONA.

COCHISE COUNTY.

J. W. A. Off, Prest. Con. Mines Co., near Willcox, will erect a 50-ton smelter.

GILA COUNTY.

A deposit of turquoise is reported in the Pinal mountains, west of Globe.

MOJAVE COUNTY.

Kingman Miner: The Tennessee mill ruins have been cleared away and work on the new mill will soon commence.——A. M. Harrington has resigned as Supt. Lucky Boy. The mine is working twenty-five men.——A. E. Ware, manager White Hills M. Co., says that the silver-gold ore below the 600 level of the Occident mine is holding out. The shaft will be continued to the 1000 level.

PIMA COUNTY.

The Helvetia M. Co. is reported to be contemplating the erection of another 150-ton smelter.

The Oro Fino G. M. Co. of Nogales has been formed; capital stock, $1,500,000. The company owns sixty acres of ground. There are three veins. A small shipment has been sent out averaging $150 per ton in silver. A. B. Hayes is secretary.

The American Wolfram Co. has made mineral entry at Tucson on the Immense and other lodes, in the Arivaca district.

PINAL COUNTY.

T. Cavanaugh has bonded to the Ray Copper Co., for $25.000, a group of copper claims lying between the Ray and the Innes group on Mineral creek.

Harrison & Chittenden are exploiting a group of lead-silver properties south of the Gila river, 8 miles east of Dudleyville.

Supt. J. J. Pheby of the Silver King tells the Florence Blade that he has recently taken ore out of the new shaft which yielded 30% copper and 1000 ounces silver. The new shaft is down 150 feet. He keeps eight teams hauling ore to Mesa City, to be shipped to Canyon City, Colo.

Supt. Parry of the Sunset group, Casa Grande district, is shipping lead ore to Deming.

J. R. McLane, general manager Kelvin C. Co. and Agassiz C. Co. of Boston, Mass., is at Florence to close up a deal on the Piety Flat group, opposite Kelvin.

YAVAPAI COUNTY.

(Special Correspondence).—Over at the Congress mine the sixty new stamps will soon be in, making 100 stamps there. The company here is running its new 40-stamp mill all right. The name of the postoffice has been changed from Weaver to Octave.

Octave, Sept. 20.

YUMA COUNTY.

C. S. McIntire will superintend the new mill to be erected by T. M. Drennan 50 miles below the Needles. The machinery is at Mellen.

CALIFORNIA.

AMADOR COUNTY.

(Special Correspondence).—Mr. Joyce, one of the owners of the Defender mine at Camp Contreras, desired to sell the mine and had a flattering offer for it. But his partner did not wish to sell. The mine has been bonded at good figures; the bonders are to sink a shaft 300 feet deep, to put up a new mill and hoist, and make other extensive improvements. They will not be allowed to take any ore from the upper or present workings, but must get all they take out from the shaft as they go down. The Defender has been a paying mine for the past two years, and the money that has been paid for the present mill, hoist, etc., has been taken out of the shaft, no drifting having been done. It is a good property.

Ione, Sept. 22.

(Special Correspondence).—The Lincoln mine, under the management of E. C. Voorhies, is going ahead with good prospects. The Mutual mine, a location north and east of the Lincoln, has a vertical shaft down 300 feet, drifting south and crosscutting west.

The Central Eureka has just completed one of the best 10-stamp mills in the county, with electric power and all else which makes a complete saver of the gold, of which there is a liberal amount in the ore. This mine has developed into a good property, and its future at the present depth of 1800 feet is promising. The South Eureka, south of the Central Eureka, has improved in value of late; credit is due the stockholders who have been digging up assessments. It is believed that Supt. Parks' skill will bring them out all right. The Oneida mine has a finely equipped steam hoisting works and mill; location most favorably situated for cheap work. In the Kennedy mine, whose reputation as a dividend-payer is well known, the new vertical shaft is making good progress, preparing for permanent steam hoist, which will be equipped with all modern improvements; forty stamps are running as usual; chlorination works always producing.

Sutter Creek, Sept. 25.

The Shenandoah M. & M. Co., through S. K. Thornton, has made final payment on the Shenandoah mine, near Plymouth. The shaft has been sunk 500 feet, stations cut and drifts run on the 200, 350 and 500 foot levels, north and south. Milling tests have proved satisfactory, running from $5 to $13 a ton.

Record: The Peerless mine has a depth of over 400 feet, sinking being pushed.——Water power is being used at the Oneida mill for the present, the Electric Co. not having sufficient power to run the mill at the time of its completion. Only twenty of the sixty stamps are in operation.

Dispatch: The east shaft at the Kennedy mine is down about 1630 feet. The first ground for this shaft was broken in November, 1898, and, at the present rate of sinking, the 3100 feet which it was intended to sink at the outset will be attained by the end of three years from the start. Good work has been done.

BUTTE COUNTY.

The Daisy Dean M. Co. has incorporated at Chico; capital stock, $20,000; J. H. Roberts, J. O. Jilson, C. L. Crane, L. A. McIntosh.

Twelve men are employed at the elevator near Pentz. Thirty men are at work in the Cherokee mine cleaning out the tunnel to put a new flume in the 3000-foot tunnel. The pipe line is completed between the Cherokee and the Banner mine.

At the Golden Trout mine machinery for the new mill is on the ground.

At Forbestown the 20-stamp mill addition to the mill of the Gold Bank Co. is crushing ore.

The Cherokee mine is to be reopened; J. B. Boyle will have charge.

CALAVERAS COUNTY.

The Melba G. M. Co. has elected as directors W. H. Busch, J. P. Rixford, W. W. Hutchinson, E. C. Bank, P. B. Whitfield, A. W. Bean, G. W. Baker, J. R. Tregloan. Work will soon be resumed under the superintendency of Mr. Tregloan.

W. W. Weatherwax, Supt. Burdena mine, Campo Seco, has resumed work. A double-compartment shaft will be sunk 200 feet.

The Woolly West M. Co. is organized at Mokelumne Hill, W. T. Harris Pres. and Supt., to operate the Sparrow Hawk quartz mine. The ledge in this mine runs parallel with Esperanza creek in a southwesterly and northwesterly direction, gradually drawing nearer the creek in its southwesterly trend. The size of the ledge as shown by several crosscuts along the lead, exposing the walls for a distance of about 1000 feet, is from 2½ to 4½ feet from wall to wall. A shaft has been sunk 60 feet; average grade ore about $5 per ton. It is a tunnel proposition; the ore can be sent to the mill by gravitation tramway. The creek affords water enough to run a 10-stamp mill for eight months in the year.

The Ozark M. Co., operating on Six-mile, near Murphys, has reached bedrock, after passing through 25 feet of gravel, which prospects well.

EL DORADO COUNTY.

Grizzly Flat reports that since the Mt. Pleasant mine is unwatered Brown Bros. have good ore. The mine was sold to Brown Bros. for $5000—a trifle, considering its record.

KERN COUNTY.

The Continental Oil Co., near Bakersfield, has a flow of oil in well No. 11.

The Kelly Oil Well Co., at Oceanside, is working in blue shale, and is down 300 feet.

MARIPOSA COUNTY.

Manager McKenzie has bought a 20-stamp mill for the Mariposa mine.

The Green copper mine, in Oakvale, is being operated by O. R. Sydney.

T. M. Carroll of San Francisco has bought the properties of the Bunker Hill G. M. Co., sold to satisfy judgments held by him.

MONTEREY COUNTY.

J. M. Krinkel, recorder Los Burros mining district, says Gillis' total cleanup is nearly $3500. Fifteen new claims have been recorded.

NAPA COUNTY.

At St. Helena the Napa County C. M. Co. is incorporated; capital stock, $1,000,000. F. J. Taylor has two tunnels started.

NEVADA COUNTY.

Brunswick stock sold recently at 25 cents a share.

The Crystal Lake G. M. Co. has incorporated, capital stock $1,000,000; 48,125 shares subscribed. A. D. Wilson, P. H. Morris, F. W. Brenid, E. O. C. Ord, C. Y. Brownlee, M. Clarken, J. M. Gregory; principal place of business, Benicia, Cal.

PLACER COUNTY.

(Special Correspondence).—After lying idle for three years, operations have been resumed at the Trinidad mine near here. A 10-stamp mill is running at full capacity. The company expects to put in a plant to work the concentrates within sixty days. J. D. Hoff is Supt.

Cisco, Sept. 22.

Sentinel: The Rocky Bar G. M. Co. is opening a claim on the American river, 3 miles from Colfax, on an extensive scale. P. Nicholls has charge. A. M. Burnham is superintending the work for the company.——Fifteen men are putting an undercurrent in a gorge in the American river, an extensive work.——J. S. Goodwin of You Bet is putting in an undercurrent in Greenhorn canyon, near the site of the old Clipper mill. Fifteen men are employed.——A 10-stamp mill is being put in on the quartz mine owned by L. D. Butts, about 4 miles from Cisco.

PLUMAS COUNTY.

C. B. Wingate, Supt. Thistle Fork mine, has discontinued prospecting by the bore-hole method on the company's ground.

G. Gaberel, Supt. Duke mine, Twelve-mile Bar, says the mine is yielding satisfactory returns for the outlay.

RIVERSIDE COUNTY.

A new industry in Perris is shipping earth to the cement works at Colton. There is a bed of adobe near Perris especially adapted to the cement which the Colton company is manufacturing; twelve carloads a day are sent to the factory.

SAN BERNARDINO COUNTY.

H. A. Cohen is at Capt. De Lamar's Gold Mountain group, where forty stamps are dropping on ore, with the first regular clean-up to take place during his presence in California.

The Orange Blossom group, in Hykorum district, near Bengal, will be worked this season by the Desert P., E. & D. Co. of Needles; L. V. Root Sec'y, W. B. Coombs Supt.

SANTA BARBARA COUNTY.

The Santa Barbara & Naples Oil & Land Co. located well No. 2 on their property near the ocean. The well will produce enough oil to run a second rig. They claim that from five to ten barrels could be got out by perforating the casing. The plan is to go right on down until oil sand is struck.

SHASTA COUNTY.

The Hiatt mine at Quartz Hill is being worked by D. G. Hunt under bond.

SIERRA COUNTY.

A strike is reported in the Osceola, a 2-foot ledge of ore.

At the Rainbow mine, Alleghany district, Clinton and Hegarty have ore which shows free gold.

The Plumbago continues to be the chief producer of Sierra county.

In the Harper mine at Forest City a crosscut is being run to tap the pay shoot.

The Wideawake G. M. Co., capital stock $110,000, will work a gravel channel near Downieville. F. W. Whelan, president; A. T. Eastland, vice-president; J. L. Fields, secretary, Oakland, Cal.

SISKIYOU COUNTY.

(Special Correspondence).—The Black Bear mill is running sixteen stamps on good ore. They have a 32-stamp mill on the property, arranged in 4-stamp batteries, but lack of water compels them to hang up sixteen stamps. Development work is being carried on. At the White Bear men are prospecting for the old ore body that paid $14,000 and then pinched out. At the Black Bear the main tunnel is in 950 feet. The vein is being followed down from near the end of the tunnel. If the ore holds out Supt. Dagget is going to sink a vertical shaft from the surface and crosscut to the vein. The Black Bear has paid $3,000,000 since it was opened up, and is good for years to come. Twenty men are employed.

At the Ball mine, near Rollin, on the 1st. Supt. L. D. Ball doubled his force; forty-five men are working on the property. The Ohio mine is producing good ore and 1000 tons more than was expected will be taken out. New ore bodies will be opened up there this winter. At the M. I., another of the Ball group, development work is being carried on and good ore is taken out. Some of the ore shows free gold. Ore is being taken out of the Mountain Laurel, adjoining the M. I. The tunnel is in 600 feet and from near the end an incline shaft is down 70 feet. If the ore holds up well Supt. Ball will run a tunnel into the hill lower down to tap the vein this winter. The mill on the property is being put in shape. The mill has twenty stamps, three concentrators, will have two new ones, and will be ready to run Oct. 15th.

The large cyanide plant of the Portland G. E. Co., below the Ball mill, is idle. It was a failure and incompetency was the cause of it. The plant is at present in litigation.

At Rollin the 5-stamp mill of L. A. Fagundas will soon be ready to crush custom rock.

Rollin, Sept. 25.

The Sterling G. M. Co., a West Virginia corporation, has bought the Sterling and Hungry Feeder quartz mines, in Hungry Creek district, with mill, tracks, apparatus, timber claim, etc., and intend working the ledges on an extensive scale.

Terry and Duniway are taking out from $12 to an ounce of gold per man each day in their quartz ledge on Scott river.

The mill of E. D. Baker at the Cherry Creek mine is in operation.

STANISLAUS COUNTY.

Alvinza Hayward and E. P. Newhall have bought 160 acres in the Adobe Valley country, in the Coast Range back of Grayson. Newhall has developed a quicksilver lode on the Loughead land, a shaft has been sunk 100 feet, a drift run 100 feet and a pumping plant installed. Twelve men are employed.

TRINITY COUNTY.

A miner at Coffee Creek has sent to the State Mining Bureau ore containing some emerald deposits, tiny crystals visible here and there in the rock, the first discovery of the kind in that part of the State.

TUOLUMNE COUNTY.

Near Carters, at the Grizzly, the north drift from the 700 level is in 300 feet.

S. Ralston of Sonora has bonded the Hope to an Eastern company, he retaining the position of Supt. A 10-stamp mill is in course of construction.

New Era: At the Black Oak the ledge has been drifted on 100 feet, exposing all the way 8 feet of ore worth $100 per ton.

The Seminole will be started up again with C. H. Thomas Supt.

C. W. Knox, working the Riverside mine near Columbia, has a seam running $65 to the ton.

At Big Oak Flat work in the shaft at the Mack has been discontinued until the mill has been completed.

Sinking goes on in the Longfellow shaft and the mill is running.

S. Wetmore has charge of the Esperanza mine near Columbia.

YUBA COUNTY.

The secretary of the local Chamber of Commerce has received from the U. S. Debris Commission a map showing the location of the proposed dam at Daguerre Point and the adjacent land which will be necessary to be procured before the work can be commenced. The amount of land wanted comprises 5560 acres. The Commissioners state that they have addressed communications to the owners of the land, asking prices, etc. Replies to about one-half of these communications had been received and the prices asked for the land range from $5 to $100 per acre.

COLORADO.

CHAFFEE COUNTY.

Buena Vista expects that the new tunnel on the Princeton will cut the veins of eighty-five claims. The scheme is backed by Pennsylvania oil men, who say they have lost enough money in the oil business to have put a tunnel through the mountain, and it is their intention to find out what deep mining will develop.

CLEAR CREEK COUNTY.

A strike of free gold is reported in the Free America, in zinc ore. F. M. Linsley, the manager, has assays of 35% zinc and 7.95 ounces gold per ton. Some of the specimens show free gold through the zinc.

At the Bonanza property, in Chase gulch, twenty men keep two batteries of stamps going at some of the Black Hawk mills; values two to three ounces gold per cord.

The 2:40 mine in Willis gulch is shipping a car of iron to the Denver smelters.

At the O'Neill mine the company will sink to a depth of 1000 feet.

Near Georgetown the Dunkirk property has been worked since last October by the Dunkirk M. & L. Co., in charge of C. H. Morris.

FREMONT COUNTY.

In 1898 Colorado produced 444,383 barrels of petroleum; in 1899, 390,278 barrels. The value of the 1899 product was $404,110, or $1.03 per barrel. In 1898 the larger output was valued at $367,504, or 82.8 cents per barrel.

W. B. Milligen, manager Union G. Ex. Co., Florence, started the preliminary run to test the machinery of the mill this week. The mill when completed will be the largest chlorination mill in the State. It will have a capacity of 450 tons of ore per day.

LAKE COUNTY.

At Leadville, Brown, Nelson & Mortenson have organized the Garbutt M. Co., capital $400,000. The company has a lease on the Garbutt, St. Crispen and Maud Hicks lodes, adjoining the property of the Ibex Co., which is developed by a 422-foot shaft. The present operators are working on the 300-foot level. Copper-iron sulphides have been opened up and shipments made, carrying about $20 per ton in gold, silver and copper.

Leadville Miner: Manager Guth of the Banker mine has advices showing that the proposition of building a stamp mill for working the low-grade ores in the mine is being favorably considered. Bodies of oxidized ore carrying from $2 to $12 per ton are said to exist in the upper workings.——J. H. Henly, Supt. Ibex M. Co., with Long, Callen et al, have a lease upon the Fanny Rawlings property and have begun work.

OURAY COUNTY.

"The London capitalists who deposited £1,400,000 with the Morgans for the purchase of the Camp Bird mine in Colorado," says the London Daily Express of the 28th, "had the money returned to them yesterday, John Hays Hammond having advised against the purchase."

SAN MIGUEL COUNTY.

Telluride Journal: The Butterfly Co. has a bond on the Silver Bell mine, a cross vein of the Butterfly and Terrible, which the workings of the Butterfly will open at great depth.

TELLER COUNTY.

There was a sensation at the Elkton mine last week. For some time it had been suspected that some of the miners had been guilty of stealing high-grade ore and detectives were put to work in the mine with the suspects. When the shift came off on the 19th inst. each man was searched, and seven were found to have ore of very high grade hidden in their pockets. All were arrested by a posse of officers. Supt. Camp estimates that fully $10,000 worth of ore was stolen last month from the mine. The ore taken from those searched is estimated to be worth at least $500.

The sheriff has levied on properties of the Victor G. M. Co. under execution for a judgment secured by D. H. Moffat for $151,000 against the company in Denver. The legal period must elapse before the sale of the property, and after that comes a period of redemption; the final distribution of the property can not be held for several months.

For the week ending Sept. 13 the production of Stratton's Independence mine amounted to 1050 tons of ore, $64,800; of that amount the profit to the English company is calculated to be 65%.

The Golden Cycle Co. expects to put 100 miners to work. The shaft is enlarged to 4½x14 in the clear, and is now down 700 feet.

At Victor 80 feet of ore is blocked out on the Golconda. In four years $85,000 has been spent without, until the present time, a ton of pay ore being secured. The shaft is 700 feet deep and sunk in granite formation. E. R. Argertinger is manager and Supt.; H. Hodgson, consulting engineer.

GEORGIA.

BARTOW COUNTY.

(Special Correspondence). — The Blue Ridge M. Co. of 33 Wall St., New York, has purchased the property of the Etowah Iron Co. of this place. The property is near here and has an area of 17,500 acres, consisting principally of iron and manganese ores. J. J. Calhoun of Cartersville has been appointed Gen. Supt., and Thos. Crabb, Jun. Am. Soc. C. E., Newark, N. J., has been appointed chief engineer. Mining operations will begin at once.

Cartersville, Sept. 22.

IDAHO.

BOISE COUNTY.

Ola residents earnestly request that the following be believed: "E. S. Miller left this place on the 23rd of last June with a four-horse team loaded with butter and eggs, and was hauling near Warren and drove into a wet sag and got stuck. He began digging around one of the wheels and his shovel struck a quartz ledge which proved to be 10 feet wide. He had some of the rock assayed in Warren and it went $10,000 a ton. Miller was offered $60,000 for his claim, but refuses to sell." It is a little late in the year for those stories, as the close season begins July 1.

LATAH COUNTY.

At the Blue Bird mine, 37 miles east of Palouse, C. Anderson, manager, will push work on the mine.

At the Bishop mine on Jerome creek, 24 miles east of Palouse, Thomson Bros., Rock Rapids, Iowa, have agreed to advance $12,000 for its development.

SHOSHONE COUNTY.

Near Wallace, G. S. Anderson is making a survey for the Cœur d'Alene M. Co., owner hydraulic elevator at Murray, to determine practicability of bringing waters of Big and Lost creeks onto high bars along Prichard creek.

Near Mullan the G. H. M. & S. Co. has completed the installation of new machinery. About 100 men are employed.

Wardner News: J. B. Green, at his concentrator plant, is putting in a single-deck slime table, 14 feet diameter, which will be run on mill slimes. The concentrates saved run 66.3% lead, 28.5 ounces silver, 7.4% moisture. The first carload gave smelter returns above all expenses of $481.29; the second car run $481.37.

Near Burke the new plant of the Hecla M. Co. is finished. Machine drills will soon be put into the mine. The gallows-frame for the hoist is 85 feet high, built of red fir timbers 24x32 inches. Four boilers, each 250 H. P., burn coal, automatic attachment—first in the Cœur d'Alenes.

MICHIGAN.

HOUGHTON COUNTY.

The tax assessment of the copper mines of the county has been increased over $39,000,000, due to the State Tax Commission. They are now assessed at $122,000,000. The Calumet & Hecla mine shows the biggest increase, $21,000,000.

MONTANA.

FERGUS COUNTY.

At the New Year G. M. Co. Supt. Meredith says that the mill is not being run at present. Work in the mines has been increased and ore is being taken out.

FLATHEAD COUNTY.

Near Libby Jno. Hartt proposes the resumption of operations at the Silver Cable, where there is silver and lead ore which can be concentrated, and a mill, ore to be conveyed from the mine to the mill by an aerial tramway, already built but unfortunately planned. A new route will have to be selected and the tramway altered and reconstructed.

MADISON COUNTY.

The deal for the purchase of the Boss Tweed and Clipper groups of mines at Pony is reported off. The intending purchasers were to make the first payment last week, but failed to do so. The option lapsed and the properties revert to the former owners. It is understood that the hitch in the negotiations was not due to any lack of faith in the richness of the mines, but to the fact that a big payment in advance was demanded, and that the owners of the Boss Tweed and Clipper reserved for themselves eight of the best properties of the group, all of which surrounded the two developed mines.

Two corporations have bought the Manser properties—the Montana C. & G. M. Co. and the Verdi M. Co. The Montana Co. is sinking a double-compartment shaft on the main vein. The intention is to sink this shaft below the water level, where rich copper sulphides are expected. The Verdi Co. is driving a tunnel above the water level to tap the veins running through its property. B. J. Soper is Pres. Verdi Co.

MISSOULA COUNTY.

A trust deed is filed in Missoula conveying property of the Western Montana P. M. Co. to T. C. Marshall, trustee of their mining property, for the purpose of bonding the same for $50,000.

SILVER BOW COUNTY.

In the Pennsylvania mining case won against the Boston & Montana by Aug. Heinze, Judge Clancy of the District Court has allowed Heinze $265,015 as costs in the case. He asked for $324,134. The Boston & Montana has a stay of execution and will appeal to the Supreme Court.

NEVADA.

ESMERALDA COUNTY.

There was another car of seventeen tons of ore received at the Selby smelter this month from Bell & Court's Southern Klondike mines, which netted over $3900 above freight and working charges. This is the fourth car received from these mines since March, aggregating fifty-five tons and netting $13,000. Most of this ore coming from the surface croppings on three or four separate claims indicates a very promising future for that district.

HUMBOLDT COUNTY.

The Ogden Copper Co. is organized in Ogden, Utah, capital stock $375,000, to work seven claims near Golconda, 10 miles from the S. P. road. Assays show 10% copper, $2 gold, eight ounces silver.

LINCOLN COUNTY.

G. K. Fischer is at the DeLamar mine in Nevada to devise a method for economical handling of 400,000 tons of mill tailings, from which the owner expects to net an average of $1 per ton.

LYON COUNTY.

Supt. Kyle has shipped to the San Francisco office of the company a bar of bullion valued at $2524.80, of which $2422.81 is gold and $101.99 silver; it represents the returns from 170 tons of ore from the Silver Hill mine crushed at the Pollard mill in Silver City.

WASHOE COUNTY.

The Bank of Nevada has placed an attachment upon the Reno Smelting & Milling Co.'s plant for $1900.

At Olinghouse W. C. Williams is hauling ore to the Slip mill for reduction. A cleanup of thirty-two tons netted $2600.

NEW MEXICO.

(Special Correspondence).—The Caballero Onyx M. Co. of New Mexico has been organized here, capital stock $350,000, to develop and work mines of onyx. The company will put in a manufacturing plant. Officers: L. Gilbert president, H. E. Runkle vice-president, C. W. Alexander secretary; main office in this city.

El Paso, Texas, Sept. 21.

COLFAX COUNTY.

A tract of placer land, 2½ miles long and 1000 feet in width, along the Moreno river, has been secured by H. J. Reiling of Chicago. The pay dirt is 18 feet in depth and will be worked by dredgers. Tests of the gravel give 30 cents per cubic yard. The dredgers will have a capacity to handle 5000 yards daily. It is expected that two dredgers will be ready for use by June, 1901.

GRANT COUNTY.

The 20-stamp mill owned by the Mimbres Con. M. Co., on the Mimbres, 3 miles below Georgetown, was totally destroyed by fire on the 16th. The mill was erected in 1881, and until the '90's treated forty tons of ore daily. The original cost of the mill was $40,000.

OREGON.

JOSEPHINE COUNTY.

H. E. Ankeny is putting the Sterling mine in readiness for the coming season.

Booth & Wilhelm are opening up newly discovered copper property on Pickett creek.

W. T. Cope has bonded the Golconda mine on Williams creek for $12,000.

The Old Channel Co. is making improvements on the A. & B. property at Galice, lately purchased, and will operate four giants. At the Old Channel mine, on Six-mile, they will run three giants.

The Hammersley mining property has been bonded to H. Philips of the Preston Peak copper mines.

The Yellow Horn mine, near Placer, will put up a quartz mill.

The Waldo C. Co. has bought the copper mine near Waldo, formerly owned by Strong, Kelly & Shipley, and the smelter on the mine placed there by Brown & Wheeler.

TEXAS.

EL PASO COUNTY.

El Paso reports that on October 1 the Federal Smelting Co. will begin work on a new smelter at El Paso. Authority for the statement is H. J. Clifford, Supt. of the Dragoon M. Co., in Grant Co., N. M. The Dragoon mines are owned by the Federal Copper Co., composed of G. W. Jacobs and others in New York City. The company bought a site for the plant and tracks at El Paso last winter. Mr. Clifford says that the company has practically been forced to build by the smelting trust which he says was formed two months ago when the Guggenheim smelters raised $2 per ton on treating ore. The Dragoon or Federal Co. has been one of the largest patrons of the El Paso smelter for several years and the building of its smelter at El Paso will mean a revival in that section. It is further asserted that the new plant will cost $250,000 and will employ 300 men.

UTAH.

TOOELE COUNTY.

Salt Lake Tribune, 23: The management of the Con. Mercur M. Co. yesterday contracted with an Eastern chemical company, through its personal representative, who is now in town, for 400,000 pounds of cyanide of potassium, to be used in the leaching of the former's ores at Mercur. It is the largest contract of the kind ever placed in this country, and yet the consolidated company is now consuming as much as 60,000 pounds of the chemical per month.

At Ophir W. A. Clark has bought the Miners' Delight group in that camp.

WASHINGTON.

OKANOGAN COUNTY.

E. P. Wheeler, manager Mineral Hill M. Co., at Conconully, will run a 2500-foot tunnel into Mineral hill.

FOREIGN.

BRITISH COLUMBIA.

Under date of the 15th inst. Alfred R. Selwyn, Esq., C. M. G., F. R. S., writes from Vancouver: "I have been shown by one of our bank managers a water-worn, well-rounded pebble of stream tin ore. I believe this to be the first well authenticated occurrence of stream tin ore in Canada."

Greenwood reports that shipments at the B. C. mine in Summit camp will reach 2000 tons for the present month.

The Robinson group, near the Athabasca, at Nelson, has been bonded to R. L. Spencer, and will be operated under the superintendence of B. Thomas.

The Van Anda smelter and mines closed down on the 1st; the men quit work until some arrangement was made to pay their wages. The smelter was to start up again this week.

At Greenwood men are clearing land for the buildings of the Standard P. S. Co., in charge of S. Young. The smelter will have a daily capacity of 200 tons.

At Moyie, the 16th was payday for the St. Eugene Consolidated; $27,323 was distributed among its 266 employes.

The Yellow Jacket and Maude S. group, 30 miles east of Rossland, is sold to L. Will of Syracuse, N. Y., for $65,000, first payment $10,000. T. James is manager.

The Tamarac is to have a tramway from the mine to the millsite on the Salmon river.

The hydraulic compressor plant on the Mist group by the British America corporation is approaching completion.

MEXICO.

The Lewis Co. of New York, which bought the Mendoza copper mine, Barranca del Cobre, Chihuahua, now has everything on a paying basis.

The Angelica C. & S. M. Co., with property 15 miles from San Gabriel, State of Durango, has been organized in Carnegie, Pa.; A. C. McCaughan Supt.

F. H. Husted of the Guazaparez M. & M. Co., Chihuahua, will put in a 35-ton lixiviation plant.

Books Received.

"The Ammonia Process," a 66-page pamphlet, 5x7 inches, published by Henry Hirsching of San Francisco, designed as stated by the author "to introduce the ammonia lixiviation process into practical business life." The article "Extraction of Copper from Ores with the Ammonia Process," contains a detailed account of the author's operations with his process at Goodsprings, Nev. The chemistry of ammonia and copper also receives considerable detailed attention. There are also several formulæ for the preparation of sundry standard solutions, and tables of symbols, molecular and equivalent weights, and percentage composition of many chemical compounds, etc.

The General Electric Co. is distributing a 92-page pamphlet on the subject of "Aging of Transformer Iron," containing five important articles that have been issued regarding this subject, as follows: "The Aging of Transformer Iron," by Prof. W. Elwell Goldsborough; "On Slow Changes in the Magnetic Permeability of Iron," by W. M. Mordey; "Effects of Prolonged Heating on the Magnetic Properties of Iron," by S. R. Roget, B. A.; "Hysteresis in Sheet Iron and Steel," by Arthur Hillyer Ford, and the "Aging of Transformer Steel," by J. A. Capp. This pamphlet is one that could with profit be in the hands of every central station manager, and will be furnished free of charge upon application to the General Electric Co., Spreckels building, San Francisco.

Catalogues Received.

"Electric Mine Locomotives" is the subject of the latest trade treatise issued in black and gold by the General Electric Co., which sumptuously supplies illustrated description of electric mine haulage, a system that since 1888 has so developed as to be of great practical advantage, being in many cases safe, efficient and economical. The subject of cost is gone into in full detail, the exposition of this matter being a principal feature of the pamphlet.

The general catalogue of the Geo. E. Dow Pumping Engine Co. of San Francisco is a good example of a valuable trade treatise. On the left hand pages appear illustrations of the several styles of pumps, and on the opposite right hand pages concise descriptions, with lists of sizes, capacities and details of construction. The typographical excellence of the work is commensurate with its value. The catalogue appears simultaneously with the announcement of the removal of the establishment to the new works, First and Natoma Sts., San Francisco, where increased facilities enable the concern to fill the orders received for steam, electric and power pumps, and hydraulic machinery—a business in which their twenty years of successful experience gives them commendable reputation. The company gives itself a good advertisement by making prominent illustrated mention of the fact that the battleships Oregon, Wisconsin and Ohio, and sundry other cruisers, monitors, gunboats and steamships have been completely equipped with Dow marine pumps.

◆

Personal.

James D. Hague of Grass Valley, Cal., is visiting Telluride, Colo.

D. Fricot of Calaveras county, Cal., has returned from Paris.

E. A. Hardy, late Supt. Santa Ysabel mine, Stent, Cal., is in San Francisco.

C. E. White is Supt. Nevada C. M. Co., Cottonwood, Nev., succeeding Geo. Gardner.

Max Boehmer, M. E., of Leadville has opened an office at 42 Jacobson building, Denver, Colo.

Thos. Ellis of Alameda, Cal., returns to his properties in Oaxaca, Mexico, on the 1st prox.

J. A. Kelly will build and run the 10-ton concentrator at the Highland mine, Ainsworth, B. C.

E. C. Rhodes of the cyanide department of the El Oro M. Co., El Oro, Mexico, is in Pasadena, Cal.

S. F. Emmons of the U. S. Geological Survey is examining the country in the vicinity of De Lamar, Nev.

Clarence King and G. W. Middleton are examining the Groom copper property, near Wickenburg, Ariz.

D. Ross goes from the Wildman-Mahoney mine, Sutter Creek, Cal., as Supt. Badger mine, Baker county, Or.

M. E. Ailes of the U. S. Treasury Department is examining the Government assay offices west of the Missouri river.

Wm. Magenau, E. M., has resigned as assayer for the Dexter G. M. Co., Tuscarora, Nev., and is succeeded by A. V. Corry, E. M.

R. H. Toll, a Denver, Colo., mining engineer, is now in charge of the precipitation plant of the Esperanza mine, at El Oro, Mexico.

W. Spencer, surveyor at the Golden Gate, Mercur, Utah, goes to the Cochiti mine, Bland, N. M., to take charge of underground work.

J. H. Kervin, late in charge of the Ontario, Utah, assay office, goes as chemist at the new smelting plant of the Bingham C. & G. M. Co., Bingham, Utah.

Benj. S. Buckman has returned from a two years' absence in Corea, and is with the Oriental Con. M. Co., which owns three quartz properties, with a total of eighty stamps, near Michigan Bluff, Cal.

◆

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s Scientific Press U. S. and Foreign Patent Agency, the following are worthy of special mention:

Bicycle Brake.—No. 658,119. Sept. 18, 1900. Wm. H. Parsons, Great Western Mine, Cal. This invention is designed to provide a novel brake for bicycles and the means for operating the same. It consists of a supplemental rim or extension carried by the driving wheel of the machine, a segmental band having one end fixed to the upwardly extending fork, and a fulcrumed lever to which the other end is attached. A sprocket wheel is turnable journaled upon said lever in line with the lower part of the driving chain, where it passes between the pedal shaft and rear axle sprockets so that when the pedals are pressed backwardly or against the forward movement of the machine, the tension of the chain will press upon the sprocket, and act through it and the lever to pull the band into frictional contact with the rim, sufficiently to retard or stop the progress of the machine.

Car.—No. 658,142. Sept. 18, 1900. G. A. & R. F. Dunn, Dinuba, Cal. This invention is designed to provide a car having a self-contained mechanism by which its direction of travel may be changed without independent or exterior appliances. It consists of superposed frames having wheels journaled at right angles to each other, and side links pivotally connected at opposite ends to the frames so that one frame may be raised above or lowered upon the other. There are means for connecting the frames to hold them together when the lower one has been raised into contact with the upper one, and this allows the wheels of the upper frame to rest upon the track or surface while those of the lower frame are lifted independent of the surface. When the lower frame is depressed and the upper one raised the reverse operation takes place and the other set of wheels are then in position to support the weight of the car and to carry it in a direction at right angles with the first set.

Concentrator.—No. 658,120. Sept. 18, 1900. J. W. Pinder, Groveland, Cal. This invention relates to a device for concentrating heavy materials and afterwards separating the lighter and worthless material therefrom. It consists of a table, the head of which is made concave, and the lower end connecting the said head portion is inclined both lengthwise and sidewise. In conjunction with this table are a series of diagonally disposed tapering riffles parallel with the side of the table, and separated from the first named series. The discharge from each series is received upon the next, and the upper end of the table is supported on vertical standards upon each side so disposed as to allow a perfect freedom of movement which is produced by the operation of a horizontal crank wheel centrally connected with the head so that a revolving motion is given to the head of the table, while the lower end reciprocates with a longitudinal movement upon supporting wheels or rollers. The compound movement thus produced acts as previously stated.

◆

List of U. S. Patents for Pacific Coast Inventors.

REPORTED BY DEWEY, STRONG & CO.,
PIONEER PATENT SOLICITORS
FOR PACIFIC COAST.

FOR WEEK ENDING SEPTEMBER 18, 1900.

658,313.—Pipe Cap and Plug—J. A. Bernardi, Salem, Or.
658,204.—Voting Machine—C. Christensen, Oakland, Cal.
658,139.—Flusher—I. P. Clarke, Alameda, Cal.
658,236.—Vote Register—H. A. Clifford, S. F.

Latest Market Reports.

San Francisco, Sept. 27, 1900.

SILVER—Per oz., Troy: London, 29d (standard ounce, 925 fine); New York, bar silver, 62⅝c (1000 fine); San Francisco, 62¾c; Mexican dollars, 51c.

The Chinese imbroglio has greatly affected Mexican currency. The drain upon Mexican silver dollars for export to the Orient has caused a scarcity in the circulating medium at the City of Mexico, and exchange has dropped from 2.10 to 2. Interest rates have risen from 6% to 12%, and premiums of 8% are offered on the intrinsic value of the Mexican dollar by exporters.

COPPER.—New York: Lake, 1 to 3 casks, 17.00 cash; carload lots, 16.75; Electrolytic, 1 to 3 casks, 16.87½; carload lots, 16.62½; Casting, 1 to 3 casks, 16.75; carload lots, 16.60. San Francisco: 18. Mill copper plates, 20c; bars, 22@23c.

LEAD.—New York, $4.37½; Salt Lake City, $4.25; St. Louis, $4.32½; San Francisco $5.00, carload lots; 5½c 1000 to 4000 lbs.; pipe 6¾, sheet 7½, bar 6c; pig, $4.70 @5.10. London, £17 15s.

SPELTER.—New York, $4.15; St. Louis, $4.00; San Francisco, ton lots, 5½c; 100-lb lots, 5¾c.

ANTIMONY.—New York, Cookson's, 10½c; Hallett's, 9½c; San Francisco, 1000-lb lots, 12c; 300 to 500 lbs., 13@14c; 100-lb lots, 15@18c.

IRON.—Pittsburg, Bessemer pig, $14.25; gray forge, $13.50; San Francisco, bar, per lb., 2.55c in small quantities.

STEEL.—Bessemer billets, Pittsburg, $17.50; sheet bars, $22; San Francisco, bar, 7c to 12c per lb.

TIN.—New York, pig, $29.75; San Francisco, ton lots, 30c; 1000 ℔s., 31c; 500 ℔s., 31½c; less, 32c; bar tin, ℞ ℔, 33c.

QUICKSILVER.—New York, $51.00; large lots: London, £9 2s 6d; San Francisco, local, $48.50 ℞ flask of 76½ ℔s.; Export, $45.50.

NICKEL.—New York, 50@60c ℞ ℔.

MAGNESIUM.—New York, $3.00 ℞ ℔.; San Francisco, $4.00.

ZINC.—San Francisco, 5½c; slab, 6c; bar, 7¾c.

SOLDER.—Half-and-half, 100-℔. lots, 20½c; San Francisco, Plumbers', 100-℔. lots, 17½c.

BABBITT METAL.—San Francisco, No. 1, 10c.

ASSAY LITHARGE.—San Francisco, 10c ℞ ℔, small lots.

BISMUTH.—New York, ℞ ℔., $1.60 50-℔ lots; San Francisco, $2.50 to $2.75 ℔ lots.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 35c.

PHOSPHORUS.—F. o. b. New York or Philadelphia, 45@50c ℞ ℔.

TUNGSTEN.—New York, ℞ ℔., 95c; San Francisco, $1.15.

PLATINUM.—San Francisco, crude, $17 ℞ oz.; New York, $18.25; manufactured, $19.50@22.00.

POWDER.—F. o. b. San Francisco: No. 1. 70% nitro-glycerine, per ℔., in carload lots, 15¼c; less than one ton, 17¼c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11¾c; less than one ton, 13¾c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2 per keg.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9, in lots not less than 1000.

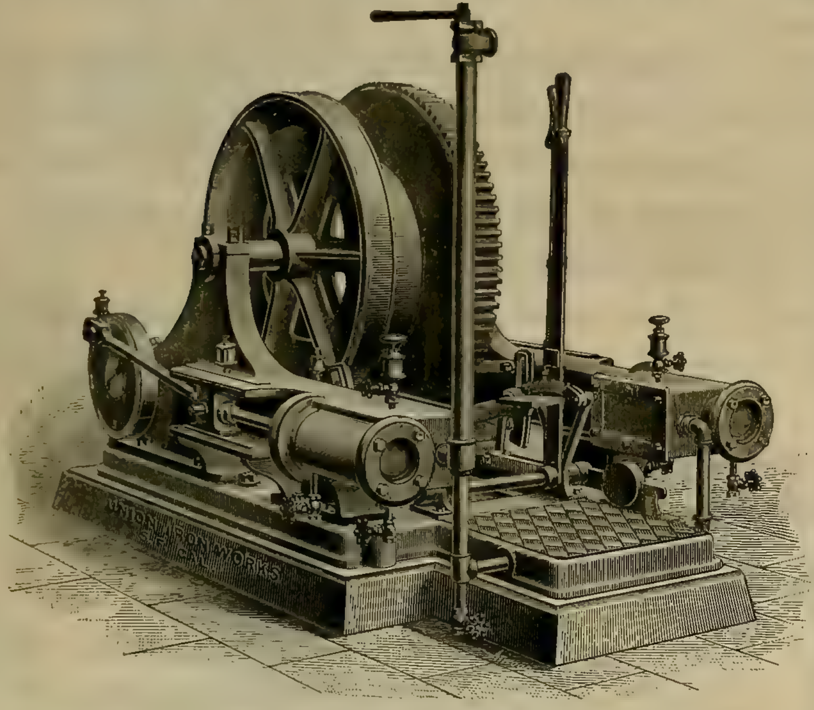
MAKE THIS SMALL

DOUBLE CYLINDER SINGLE DRUM HOIST



HOIST FOR PROSPECTING.

For Prospecting Purposes or Underground Work,

USING COMPRESSED AIR.

The entire hoist is self-contained, being mounted on an iron sole plate or bed which carries all the operating levers and provides a footboard for the operator. The engines are provided with reversible link motion and the drum with a broad strap brake, insuring safe and rapid work.

The general lines upon which this hoist is designed are neat, strong and substantial and all the operating parts are conveniently arranged.

The size herewith illustrated is the 4 in. x 10 in., rated at 15 horse power. The larger sizes, 8 in. x 12 in. and upwards are provided with post brakes.

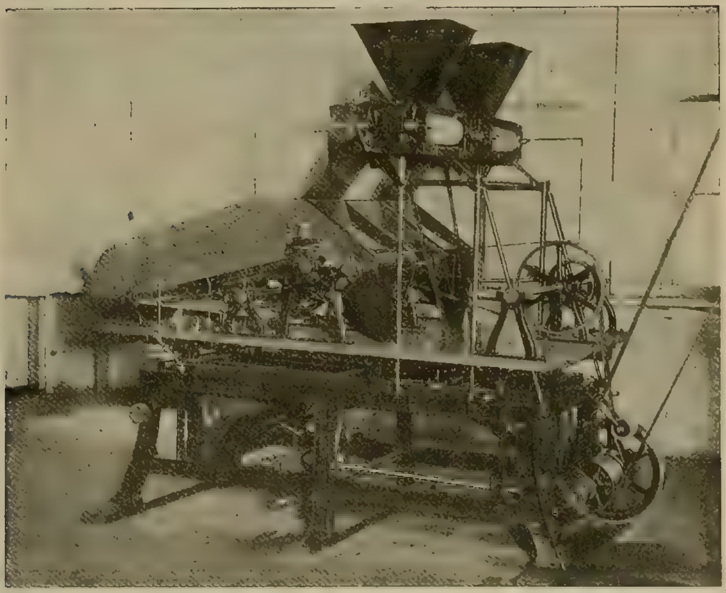
CROWN GOLD MILLING CO.

Manufacturers of the "CROWN" CONCENTRATOR and CROWN ORE SIZER. A dry process of sizing and concentrating ore, sand or gravel. Designed to accord fully with the laws of specific gravity, and especially adapted to refractory ore or localities where there is no water.

The chief claims for the Crown Concentrator are that it occupies less floor space and has nearly four times the capacity of any wet concentrator; that it will concentrate ores containing base and refractory metals that ordinarily slime and carry off values; that it effects a saving of values far above the ordinary methods of concentration.



We have, now in operation, a complete plant for crushing, sizing and concentrating ores by the

Crown Dry Milling Process.

Mine owners desiring tests made can forward us, freight prepaid, not less than 1000 lbs. nor more than 4000 lbs. of sample, for which a charge of $20 will be made. (This amount includes assaying, etc.)

Ores for which this process is adapted and of which consignments are solicited are any concentratable ores, pulps, tailings, or sands, carrying sufficient values, whether they have heretofore been profitably concentrated or not.

THE GRIFFIN
THREE ROLLER
ORE MILL.

The Griffin Three Roller Ore Mill is a simply constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilian Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

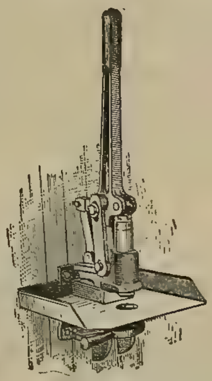
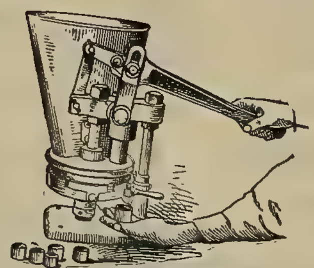
ONE OF OUR MANY SPECIALTIES FOR ASSAYERS.

The Calkins Cupel Machine.



WALL PATTERN.
In position for filling mold.



THE AUTOMATIC.
Showing finished cupel being expelled.

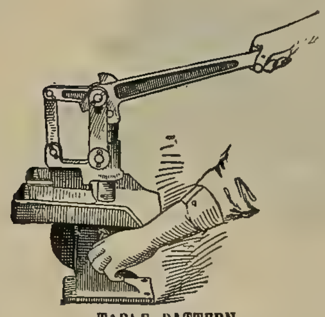


TABLE PATTERN.
Showing position of lever when greatest compression is obtained.

To Assayers:

With these machines perfect cupels can be made by anyone with great ease and rapidity.
They are the greatest labor-saving machine of the Assayer that can be had.
Compact, easily operated, can't get out of order, everlasting.

WRITE FOR OUR NEW, DESCRIPTIVE PAMPHLET IN WHICH ALL OUR SPECIALTIES ARE FULLY DESCRIBED.

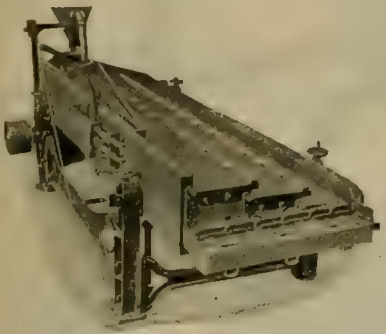
THE IMPROVED BARTLETT CONCENTRATING TABLE.



The BARTLETT CONCENTRATING TABLE has been GREATLY IMPROVED recently by the substitution of iron in place of wood wherever possible. It is now built with SOLID IRON TOP, PLANED TO A TRUE SURFACE AND POLISHED; all parts are made by template and EACH PART BEING INTERCHANGEABLE. As now constructed, the table has no special wearing parts and will last for many years. It has a CAPACITY OF FROM FIFTEEN TO FORTY-FIVE TONS IN TWENTY-FOUR HOURS, according to the class of ore worked. It is the only table in the world which will take the place of jigs and do away with all costly and complicated machinery.

It is Especially Designed for Separating Zinc from Lead.

Send for our illustrated catalogue, containing all the latest information on the concentration of ores.

THE IDEAL CONVEYOR BELT

Is the one that will carry stone, ore, coal, wet or dry material, holding buckets firmly and securely; will stand all kinds of exposure, and resist the heaviest strains during a long period of service. This is what the **LEVIATHAN BELT** has done, and we quote the following from a letter from the New York Steam Co.:

"We have used Leviathan Belting for four years, up to 24-inch by 8-ply, elevating and conveying coal. Some of the Belting is outside, exposed to freezing weather; some in a steam bath. In both conditions the results have been very gratifying, over 500 tons having been handled in ten hours time."

MAIN BELTING COMPANY,

1225-41 Carpenter Street, Philadelphia.

The above illustration shows an operator taking an incline above the horizontal with BRUNTON'S PATENT POCKET MINE TRANSIT. The instrument is made especially for mining engineers, mine managers and superintendents, but its light weight and the ease with which it can be handled render it admirably adapted to the taking of topography and for geological field work. Write for catalogue B, giving full description of the instrument and all its uses, to

No. 043 BUTTON BALANCE, 10-inch beam. Sensitive to 1-100 Milligramme. This is a double-column button balance with all latest improvements, including our new adjusting device and rider rod lock. It is accurate and as rapid as a beam of this length can be. For an office doing a moderate amount of work, it is the best balance to be had for both gold and silver. For complete description and prices of this and other balances send for catalogue A to

THE LITTLE ALASKA GOLD WASHER.

Price $6. Saves the Gold. *Weighs only* 7 1-2 Lbs.

After several years' practical use in different fields, our washer has established its superiority over all placer or beach washers. It is just the washer for Cape Nome; it was used extensively in Alaska last year with every success. In working the operator does not have to wet his hands and can stand in an upright natural position. It is just the washer for the poor man who has not the money to put in expensive machinery. It will do the work of ten men with gold pans. It is just the washer for the prospector, being light and easy to pack. Don't fail to write us if in need of a washer; we can save you *time*, *labor* and *money*. RUSSELL & KINSEY, 1237 Magnolia Ave., Los Angeles, Cal.

IMPROVED BONE ASH.

It is 100% better than Bone Ash now being used; will absorb more lead, will never crack or split in the Muffle, can be dropped before or after using without breaking. Cupels can be made and used at once; no drying required. Excessive heat has no effect on them. Will stand shipping any distance. It takes up none of the precious metals in cupeling. Cupels much quicker. Once used always used. Sold under a positive guarantee or money refunded. Now being used by all smelters and assayers who have tried it.

Correspondence solicited.
Samples given if required.

WITTE GASOLINE HOISTS
ARE MONEY EARNERS.

Made for use in places far from factory. Are built in parts and in duplicate. Renewals easy and quick to get. Strong, substantial and reliable.

Operate on GAS, GASOLINE or DISTILLATE.

There Are Others, but None as SAFE AND RELIABLE.

RIVETED IRON AND STEEL PIPE

FOR HYDRAULIC MINES, IRRIGATION AND POWER PLANTS. Manufactured from the best grades of IRON or STEEL by **MODERN MACHINERY.**

AGENTS FOR THE Celebrated CANTON STEEL.
Schaw, Ingram, Batcher & Co., 539 Mission St., SAN FRANCISCO. 211 to 219 J St., SACRAMENTO.

SMOOTH-ON TRADE MARK CASTINGS.

An iron cement for repairing leaks or fractures in steam or hydraulic work. When hard it will withstand a red heat, steam, water or oil, and expands and contracts with heat and cold the same as iron, insuring a tight joint at all temperatures. Difficult flange connections can easily be made with Smooth-On, as it adapts itself to the flanged faces whether parallel or not. Connections are easily taken apart. Unequaled for boiler patching, and repairing blemishes in iron castings. Write for catalogue and prices. Sole proprietors and manufacturers: Smooth-On Mfg. Co., Jersey City, N. J., U. S. A.

The Lunkenheimer "Clip" Gate Valve.

Single Disc
DOUBLE SEATED.
Made with Screw Ends from ½″ to 6″,
Flange Ends 2″ to 6″ sizes.

BEST IN QUALITY.
LOWEST IN PRICE.
THE ENGINEERS' FAVORITE.

These Valves are made of cast iron and all wearing parts of gun metal. They are superior to the common, cheap, brass valves with which the market is flooded.

WHY?

BECAUSE they possess all the advantages of a cast iron pipe fitting (Elbow, Tee, Coupling, Union, etc.) namely—are heavy and rigid—not injured by expansion and contraction or rough handling in pipe fitting. TAKE PRESSURE FROM EITHER END. Body and hub are held together by a steel clip, consequently always easily taken apart. Joint between body and hub made permanent by an imbedded seamless oval copper wire washer. If you desire the BEST, STRONGEST and MOST DURABLE valve for general purposes on all ordinary pressures, use this valve. IT IS A STANDARD FITTING, OF NEAT APPEARANCE and FULLY WARRANTED TO SATISFY. Made also in All Iron for Cyanide Plants. Try them and be convinced. Specify them and order through your dealer. Our Catalogue of superior Steam Specialties FREE for the asking.

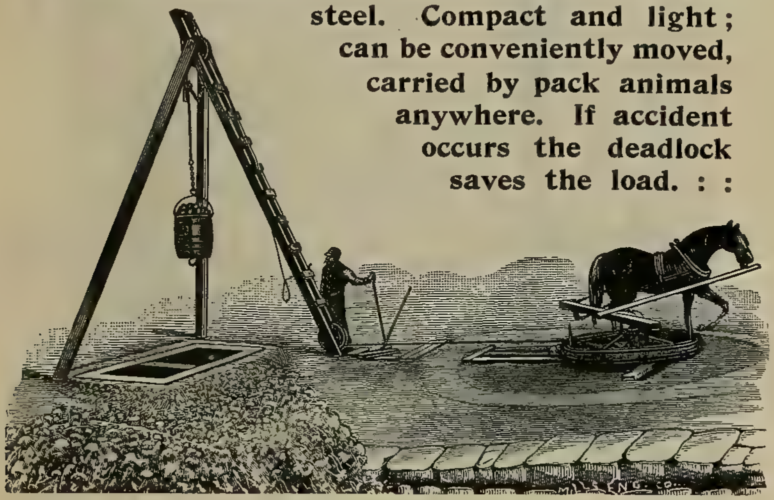
ADAM SCHILLING & SONS,
213 & 215 Main St., San Francisco, Cal.

THE COMMON SENSE WHIM

Is made of the best wrought iron and steel. Compact and light; can be conveniently moved, carried by pack animals anywhere. If accident occurs the deadlock saves the load. : :



SINKING PUMPS,

Indispensable in sinking mining shafts or pumping out flooded mines. Easily raised or lowered by cable or rope. Equipped with outside packed plungers. Handles gritty or dirty water. Operates bolted to shaft timbers or only suspended by cable at any angle. Packing glands external. May be adjusted while in motion. Removable parts hinged. Steam movement positive and simple.

Correspondence Solicited.

CALIFORNIA WIRE WORKS, - 9 Fremont St., San Francisco, Cal.

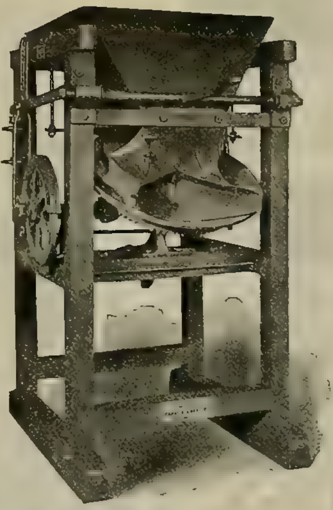
THE "JAMES" AUTOMATIC ORE FEEDER.

THE "JAMES" ORE FEEDER,

as illustrated on this page, is a machine of improved design for the automatic feeding of ores to stamp batteries and other crushing machinery. It is perfectly adjustable while in operation, and will feed equally well ores wet or dry, coarse or fine.

⁂

Shipping weight, with wood frame, - 800 pounds.
" " " iron " - 1000 "



ADVANTAGES

The advantages of this ore feeder, over any others that are in the market, are, that the feed is positive and will not gig back no matter how slight the motion to the arm; it can not possibly spill ore of any character and will definitely measure out from one to fifty tons per day of any class of ore.

Mining Frozen Ground in Siberia.

In the basin of the Amur, methods of mining the frozen soil of Siberia are interesting. The number of days in the year in which the temperature of that part of Siberia is below freezing point is about 200; the mean temperature for the whole year is below freezing point; the lowest temperature reached is — 37° C., the highest +27° C. The temperature conditions of the whole year tend to form ice rather than to melt it, and the whole of the superficial layers of the earth's crust are thus completely frozen. The miner has accordingly to deal with gravels frozen hard, though in places certain local actions may keep patches of ground from freezing, especially in swampy districts, so that the possibility of the workings being suddenly flooded is always present, in spite of the frozen condition of the ground. Frozen alluvium contains from 7% to 12% of ice; in this condition it is hard and tenacious, does not break under the pick, and dynamite and powder have little effect upon it. Hence these frozen gravels can only be worked by thawing, as in the Klondike, either naturally by the action of the sun's rays in the short summer season of about five months, or artificially. Direct flames, heated metal and steam have been tried, but only the first-named method is of any use. Practice has shown that a layer of burning wood properly applied will only thaw out its own thickness of frozen gravel, while it is impossible to thaw out a greater depth than one foot at each operation. When thus thawed, the gravel can readily be got out by means of the pick. At the placers of the Daourskaia Company, near Nertchinsk, three methods of mining the auriferous deposits are in use—open-cast working by hand, machine excavation and underground work. The first two methods are only applicable in the summer season; the last named can be worked all the year round, but is confined to the winter time, as it is preferred to employ all available hands at the surface as long as possible. The open working presents no peculiarities except that the depth of each face is very small, about one foot, to enable it to be thawed by the heat of the sun; stripping the barren surface earth is commenced as early in the year as possible, to expose the greatest possible surface of auriferous gravel to the influence of the sun: an average day's work amounts to three cubic yards of excavation per head. The machine excavator is only used for raising old tailings that have been worked, but which contain sufficient gold to be worth working over again. An interesting method of working is underground; shafts are sunk along the axis of the placer down to the bedrock, about 55 yards apart, and connected by a drift running on the bedrock and about 14 feet wide. From this drift crossdrifts are driven 14 feet wide and 14 feet apart to the rim rock of the placer; these crossdrifts are then connected by short cuts 14 feet wide, leaving the whole deposit thus cut into pillars 14 feet square, one-fourth of the whole area being left standing in the form of these pillars. After a district has thus been laid out the pillars are systematically robbed, working from the limits of the placer backwards and allowing the roof to come down. The complete working out of a district takes about three years. During the course of this operation a system of timbering is employed, consisting of close-fitting sets of timber framed of round wood six inches in diameter; in the main and crossdrifts these sets are kept in place by longitudinal timbers along the workings; all working faces are also kept close timbered.

The timber protecting the face to be worked is removed, firewood is piled against it, covered with a layer of charcoal to keep the heat down as far as possible, and set fire to; when the face is sufficiently thawed the fire is extinguished and the thawed ground cut down by the pick, fresh timber put in, and the work proceeds. One difficulty is that the heat required to thaw the face naturally rises in spite of all precautions and produces dangerous hollows above the roof timbers, together with falls of ground that are a source of accidents. The consumption of wood for mine timbering and firewood is great.

(See Page 401.)

A Large Pump.

The work of dismantling a huge Corliss pumping engine is going on at Allentown, Pa. The pump was constructed in 1868 for the Lehigh Zinc Co., for obtaining water from a mine. The cost of building and installing the engine was almost a million dollars. The difficulties of erection were rendered greater by the engine being placed near the mine shaft. The engine frame and bearings are bolted to solid cut-stone masonry, 80 feet deep. Owing to the fact that the mining interests waned, it was decided to abandon the engine. It has not been operated for three years. At the time its destruction was begun it was in excellent condition. Dynamite is being used to throw down the heavy walking beams from their bearings, while block and tackle will prevent them from falling after the explosion. After that each one will be broken into suitable sizes for shipment. It is estimated that there are sixty tons of brass in the bearings and fittings. The height of the engine from the surface of the foundation to the top of the walking beam is 50 feet. The weight of the entire engine is 1500 tons. The diameter of the steam cylinder was 110 feet, the stroke 10 feet. The pump was intended to deliver 14,600 gallons of water per minute. There were two walking beams mounted on the same shaft 10 feet apart. They were jointed at their heads by many rods two feet in diameter, to which the connecting rods were fastened. Each beam weighed forty-four tons. The flywheels were two in number, one situated on each side of the steam cylinder, weighing ninety-eight tons. The flywheels were 30 feet in diameter. The material goes to the junk pile.

ONE can now talk by telephone from San Diego, Los Angeles, San Francisco, Cal., Portland, Or., Butte, Mont., Denver, Colo., and Salt Lake City, Utah.

THERE is now a class of the miners employed at the Comstock, Nevada, that regularly meets for study, to qualify the members for the degree of mining engineer to be conferred by the University of Nevada. The idea is in every way commendable and worthy of practical observance.

MUNICIPAL OWNERSHIP of any great public utility can not be as much of a commercial success as private ownership. No one working for a city will put in daily use the brains, the energy, the watchfulness and the economy of operation required in private ownership and business competition. This is not because of lack of honesty or public spirit or good intent. It is so because of the very nature of things, and is not nearly so much a surprise that it is so as would be a solitary instance where the opposite result were observable.

LAST Monday the director of the U. S. Mint increased the price to be paid by the Government for silver from 55 to 57 cents per standard ounce. The price has advanced unsteadily since 1896, when the Government price was 47 cents. The present price quoted commercially—63¾—is the highest for some years, and is chiefly caused by large Asiatic and European coinage orders. India has been buying all summer, China began buying in August, and in September the British mint made considerable purchase. Nearly all those orders were for October delivery. During last month the U. S. Mints coined in silver $3,932,185.

AN old idea in a new garb is presented in a communication from Sumpter, Or., which, boiled down, alleges that the Standard Oil Co. is acquiring mining property in that district; that its tactics are to do sufficient work on a prospect to develop its value, and then cover it up, on the principle that it is safer there than in any bank, can be produced at will, and is not subject to taxes. Sumpter understands the art of advertising, and the statement is a good bid for prominence, which is here given it. The idea attributed to the Standard Oil Co. was an old one in the days of the Phœnician tin miners, but has not been overworked lately.

Of Valued Service.

The receipt of the twentieth annual report of the U. S. Geological Survey and a cursory examination of its fine volumes shows how well that important branch of the public service is filling its mission in aiding the development of the nation's mineral wealth. It is one federal work in connection with mining that deserves just commendation, and it is only justice to say that with the limited means at their disposal Director Walcott and his skilled assistants are doing valuable work; valuable to the prospector, the miner, and the mine investor.

It is within the memory of men not yet old, as years go, when metal ore deposits were considered as "freaks of nature;" when everything in connection with mining was looked upon even by educated men as a matter of chance or luck. But from chaos comes cosmos, and out of the welter of shapeless beliefs come laws as certain as those that regulate the passage of the hours. The formulation of those laws is primarily due to the miners themselves; in almost as great a degree to the mining engineers, metallurgists and chemists, who have advanced mining and scientific knowledge in theory and practice, and in these later years the U. S. Geological Survey has done much to determine data that are to the miner as well-made maps to the traveler or soldier. The rule of three slowly supplants the rule of thumb; the old "where it is, there it is" theory of gold formation and existence still has its devotees, but there is yearly a clearer popular perception of the basic laws that govern the basic industry of the nation, and for an understanding of these primal laws we owe much to the work of the U. S. Geological Survey.

The great work of creating a geologic atlas of the United States goes on, and prominent mining districts are successively given detailed attention. This branch of the work has been already discussed at considerable length. It forms but a part of the research and publication constantly carried on. General geology, paelontology, hydrography or stream measurement, forest reserves, description of prominent mining districts, Alaskan explorations, are among the subjects on which work continues. The timeliness of this work is an added element of value. For instance, on the last mentioned subject there is a volume of over 500 pages—an up-to-date encyclopedia on Cape Nome, Tanana and White River basins, the latest and newest American gold districts. Doubtless were there a great metal discovery of any kind reported from Cape Barrow the U. S. Geological Survey would have a bulletin out inside of a month with the latest procurable facts and an elaborate monograph thereon before the close of the year. This prompt recognition of the immediate demands of the prospector and miner characterizes the policy of the Survey, and while not neglecting the requirements of general scientific research, the more homely needs of the day and hour are supplied.

The simplicity of truthfulness, the absence of favoritism, the regard for accurate determination of existing fact, the unbiased independence of statement and the sterling character of the prompt information furnished are among the attributes that give value to the work of the Survey.

THERE is some present discussion as to the difference between American miners and those not American. One apparent difference does not seem to have been touched upon as yet in the discussion, viz., the fact that miners working in American mines in any capacity are not usually content to be told that a thing is so without knowing why it is so, what made it so. They do not care to have any one do their thinking for them, preferring to do their own thinking, and are not looking for opinions or information second hand. An instance of how this fact is not generally understood elsewhere was recently afforded in the case of a man who visited this office with a newly devised mining appliance of improved merit that he wanted to have brought to the notice of the mine superintendents of the United States. He had two flattering testimonials, one from an Australian mine manager, the other from a British mining engineer, and asked that they be published, saying "that will be all required." He was told that a great deal more would be required, if he wanted to enlist the notice of any mining men in America whose attention was worth having; that the best way to do would be to furnish a sectional drawing of his device and a brief technical statement of what it was intended for and what could be truthfully claimed for it, that American miners might read and decide for themselves as to the merit or lack of merit of the apparatus. To this the gentleman from England demurred, claiming that all the miners need be vouchsafed was to be told just what Messrs. So and So of Australia and London thought of the machine. This might do elsewhere, but would not win in the United States, where there is no glamour of names, and where miners pay little attention to anything that does not appeal to their intelligence. With surprise the representative learned that while the gentlemen whose testimonials he held were doubtless very worthy people, what they thought or did not think about mining devices was of no material importance to American miners, and that three lines of description outweighed three columns of testimonials. The instance illustrates one element in the mental make-up of men working in American mines that has not been touched upon in the discussion referred to.

THE official call for the ninth annual convention of the California State Miners' Association names Nov. 19th as the date and San Francisco as the place. It is none too soon for the several county mining associations to begin the work of selecting delegates and determining what shall be brought before the convention. There are several matters of importance to all sections of the State, and, also, questions affecting different parts of its area that need attention. To give due heed to such requirements is a part of what the annual convention is for. The convention is the place to bring matters of general value to the mining interests of the State that may be aided. The convention is made up of the several county organizations; they give it life, and constitute its existence. The work of the association goes right on through the year; it is continuous through its committees; part of the business of the annual convention is to hear the reports of those committees, and instruct them as to future action. But of equal importance is that the several county organizations formulate their needs and ideas, and present them in convention. The meeting of 1900 should be as large in numbers and profitable in results as any of its predecessors.

RHODESIA, SOUTH AFRICA, understands the art of advertising, and is up-to-date in claiming attention to its gold mines. Assertion is made that as soon as the Boer war is over a railroad will afford all modern advantages. Figures are furnished regarding one mine—the Globe & Phœnix—that sound as familiar as similar calculations nearer home. The figures, which of themselves do not lie, say that 5907 tons ore were crushed in twenty-four days, yielding, on the plates, 4742 crude ounces, and a profit of $62,831.38. The expenses are stated to be $29,486.12; so that the 4742 ounces must have produced $92,317.50, or $19.46 per ounce, which for crude gold is extraordinarily good. It is very seldom in South Africa that gold .942 fine is produced. Of course, that affords fine base for the prospectus: "Take an average of £13,000 profit a month," says the Review; "then we get £156,000 a year net!" Of course we do! The London Rhodesians have nothing to learn of the boomer's art, and do not bother about little things like facts.

"Is the Paris Exposition profitable to the exhibitors?" is a question now being discussed toward the close of the latest international exhibition which rounds out fifty years of such display. The general expression of opinion seems to be that the exhibition did not pay those who exhibited. This paper thinks differently. It thinks that such exhibition was opportunity for good advertising; and a good advertisement of a good article always pays. Those who are adverse in their comment on the conduct of the big Paris show are, however, undoubtedly right in saying that the wholesale giving of medals and honors brings the whole thing into contempt. In a manifest desire to please every one the French fair directors have cheapened their awards and have permanently hurt whatever prestige attaches to their receipt. The fact that the fair itself is not a financial success will go far toward deferring any future effort of the kind in any European capital.

Concentrates.

167° F. = 75° C., that is, $(167 - 32)\frac{5}{9} = 75$.

At the North Pole any earth direction is south.

The Alaska Treadwell stamps have a daily crushing capacity of 2860 tons ore.

Current Boston rates of Cochiti, N. M., G. M. Co.'s stock are at $8 per share; par value $25.

The kind of people who read circulars are usually too poor to buy what is commended therein.

The United Verde property of Arizona has been a copper producer and dividend payer since 1887.

A gold dredging machine is subject to taxation in the county in which it is permanently operated.

In the twelve years from 1888 to 1899, inclusive, California produced 6789 tons manganese, worth $60,766.

Cobalt oxide sells for about $1.80 per pound, or about $3.96 per kilogram. It is dealt in by the American Nickel Works, Camden, N. J.

With pyritic ore copper or brass screens are used to discharge the pulp from the battery, as the acid in the ore tends to oxidize iron screens, corroding them.

"Lis" is a Mexican term applied to mercury as the word "flouring" is in the United States—when the mercury separates into minute globules and refuses to amalgamate.

A luting around muffles that will stand fire is made of two parts litharge, ten parts bone ash, mixed thoroughly dry, water then added till of the required consistency.

The ordinary gas burner decreases markedly in its efficiency after a short time. An entirely new tip will give a much brighter light than one that has been in use but a brief period.

Tellurides are not found in sedimentary rocks—only in crystalline and igneous rock formations; lead and zinc are found in limestone, and, seldomer, in the eruptive rocks and granites.

Water under pressure will rise vertically 2 feet approximately for every pound of pressure, such use being dependent upon the pressure in pounds per square inch, and independent of size of pipes.

The average run of Rand, South African, gold ore is about .4 ounce per ton crushed—that is, about two-fifths of an ounce crude gold, or about .85% of that, fine gold, or, approximately, $7 per ton of all ore crushed.

Buying good mining stock is better than betting on election results. To win in the latter would only double one's money; the former affords finer opportunity for prefitable investment and without occasioning expense to another.

Some millmen claim that the formation of "verdigris" on copper plates can be prevented by binding them on the tops and sides with iron strips, and that the acid in the pulp will attack the iron in preference to copper, leaving the latter bright.

One of the reasons for the cost of zinc reduction is due to the fact that the temperature at which zinc oxide is reduced by carbon is very high, and being above the boiling point of zinc compels the conduct of the operation in retorts instead of in a smelting furnace.

A man has a right to leave his employment at any time, so long as he breaks no real engagement, and that right can not be restricted because of alleged wrong motive. A man has a right to do as he pleases—provided he does not interfere with any one else's right to do as he pleases.

Sludge in final procipitation vats in gold chlorination plants has value dependent upon the care and skill exerercised in chlorinating, and, in a degree, upon the quality of the ore. The gold obtained by final treatment from the sludges will not ordinarily exceed 2% of the total gold obtained in the chlorination works.

The only new thing sought by the majority of devisers or designers of new steam engine forms is to utilize more of the heat generated by the fuel consumed. As only about 50% of the units of heat in the fuel is utilized, there is still room for manifest advance. The form or arrangement is of little consequence; the commercial point is economy of operation.

There are no mechanical difficulties in the way of using crude alcohol as the working agent in oil or gas engines, but the cost would be absolutely prohibitive, being about five and five-eighths times as much as if burning oil were used in the motor, and about three and one-fourth times as much as if petroleum spirit were the combustible employed.

That quartz veins may be of comparatively recent origin is exemplified by such occurrences as that near Volcano, Amador county, Cal., where a distinctly marked quartz vein is observed to cut through beds of sand and gravel, presenting unmistakable evidence of having been formed subsequently to their deposition by the action of siliceous waters.

In a laboratory method of making sodium amalgam a flask of mercury is heated to about 300° F., and then small pieces of sodium, about the size of a pea, are gently dropped in, one at a time, until 3% is added. As each little pellet is dropped into the hot mercury a little explosion occurs, and the operation is necessarily slow. When the requisite percentage of sodium has been added the mercury is poured into a flat dish and allowed to cool, after which it is broken up and put into stoppered bottles under naphtha.

It is not unknown to find in placer gold workings a vein of gold quartz ore crossing the placer ground. Such has been found at Hoosier Pass, Summit county, Colo., where at an altitude of 1400 feet an oxidized outcrop of gold quartz ore followed through placer workings by shaft and tunnel developed a paying lode, as well as placer mine, on the same claim.

During 1899 San Francisco received coal as follows: From British Columbia 447,200 tons; coast mines, 710,600 tons (exclusive of coal received by rail from Mt. Diablo, Tesla, Colorado and Utah); Australia, 130,600 tons; Great Britain, 99,200 tons; Eastern, 34,400 tons; Mt. Diablo, 50,000 tons; Tesla, 80,000 tons; Colorado and Utah, 40,000 tons, a total of 1,592,000 tons. Southern California ports received 187,000 tons. Australian Newcastle coal ranged in price during the year from $6.25 to $7.50 per ton.

All steel used for boilers of steamships constructed under Lloyd's rules is required to have an ultimate tensile strength of not less than twenty-six tons, and not more than thirty tons per square inch of section, and the ultimate elongation must not be less than 20% in a length of 8 inches. It is to be capable of being bent to a curve, of which the inner radius is not greater than one and a half times the thickness of the plates or bars after having been heated uniformly to a low cherry red, and quenched in water at 82° F.

Sec. 2319, Revised Statutes, U. S., says: "All valuable mineral deposits in lands belonging to the United States, both surveyed and unsurveyed, are hereby declared to be free and open to exploration and purchase, and the lands in which they are found to occupation and purchase, by citizens of the United States and those who have declared their intention to become such, under regulations prescribed by law, and according to the local customs or rules of miners in the several mining districts, so far as the same are applicable and not inconsistent with the laws of the United States."

In the Siemens-Halske method for treating the cyanide liquors from the waste tailings or sludges produced in cyanide gold extraction, and containing a very small amount of gold, an extremely dilute solution of cyanide is employed to dissolve the gold. This is afterwards subjected to electrolysis, with iron anodes and thin lead cathodes, with a current density of two-tenths of an ampere per square foot. This results in an almost complete recovery of the gold in an adherent form upon the lead cathode. When the required amount of gold has been deposited the cathodes are removed and the gold separated by cupellation.

The decision by the Secretary of the Interior, Aug. 3, in the case of Marborg of Colorado, in which it was held: that an applicant for patent who has been adversed in the court is not obliged, after the commencement of adverse proceedings, to keep up the annual expenditure under Section 2324, Revised Stats., U. S., in order to prevent relocation and probable loss of his claim during the pendency of such proceedings, and that the same rule is applicable to protest proceedings before the land department—is interpreted to mean that it removes the necessity of doing annual labor on any unpatented mining claim against which there is any litigation.

As between cyanide and barrel chlorination process, the greatest difference in cost after roasting lies in the amount and value of chemicals used. The chemical cost in chlorination would vary from 50 to 70 cents per ton; in cyaniding from 25 to 45 cents per ton. While this fragmentary statement would appear to indicate that chlorination would be dearer, other elements, such as coarser crushing for chlorination, and percentage of saving, would offset such implication. The difference would require some space to explain, and as for comparison that need no longer be instituted. The ore itself should determine the process, and that can be best learned by experience.

A method for determination of iron in ores is as follows: Digest 1 g. ore in 10 c.c. strong nitric acid, adding 5 c.c. hydrochloric if the substance be found difficult to decompose. When decomposition is complete, add, without removing from heat, 10 c.c. concentrated sulphuric acid; boil till nitric and hydrochloric acids are completely expelled; remove from source of heat, and, when cool, add 50 c.c. water; boil till all soluble sulphates are in solution, and filter into a copper flask, washing the filter thoroughly with hot water. To the solution in flask add three strips heavy aluminum foil, free from iron, and boil till the iron is entirely reduced to the ferrous state, which may be determined by ammonium-sulpho-cyanate in the usual manner, when the solution is ready for decantation, and titration with standard solution of potassium permanganate. If copper is present in the sample, it will be found precipitated on the aluminum and its percentage may be determined by either the cyanide or iodide method, if required.

A cheap and effective dressing for a belt is tallow. When a belt is pliable, and only dry and husky, the application of blood-warm tallow, thoroughly dried in by the heat of the sun or fire, will tend to keep the belt in good working condition. The oil of the tallow passes into the leather, serving to soften it, and the stearin is left on the outside, to fill the pores and leave a smooth surface. The addition of resin to the tallow for belts, if used in wet or damp places, will be of service and help preserve their strength. Belts which have become dry and hard should have an application of neat's foot or liver oil mixed with a small quantity of resin. This prevents the oil from injuring the belt and helps to preserve it. There should not be so much resin as to leave the belt sticky. Belts should not be soaked in water before oiling and penetrating oils should but seldom be used, except occasionally when a belt becomes very dry and hard. It may then be moistened a little and have neat's foot oil applied. For new belts a composition of tallow and oil, with a little resin or beeswax, should be used. Prepared castor oil dressing is good and may be applied with a brush or rag while the belt is running. Belt dressings of any kind must not be applied too liberally in the case of a new belt, otherwise it is apt to stretch, making it very liable to run out of line.

An ammoniacal cooler for preventing fire damp explosions is made. On introducing into shot holes ammoniacal or hydrated salts, not explosive of themselves, their volatilization under the influence of the detonation is capable of cooling down the gases sufficiently to avoid all ignition of fire damp, and, inasmuch as the salts produce disagreeable nitrous vapors, certain inoffensive substances, rich in carbon, for preventing the formation of nitrous vapors are added to the salts. In practice the powder or other explosive is inserted into the bottom of the shot hole, and then, by way of tamping, a quantity of ammoniacal cooler, equal to half the weight of powder employed, is added on top of the charge, although the result would be the same if the cooler were placed on the bottom of the hole and the powder on the top. Inasmuch as the salts which constitute the cooler are hygroscopical, they are compressed into the form of cylinders, which are covered with paper and carefully stuck, and coated with melted paraffine, for preserving the salts so long as the paraffined case remains intact.

Velocity is measured by the number of feet traversed in a second. Thus a cricket or base ball hit hard travels about 100 feet per second, which is about the rate at which a carrier pigeon flies. A golf ball may start at 150 feet per second, an arrow at 250 feet, a pistol bullet at 750 feet, a rifle bullet at 1500 to 2000 feet. But the energy of the blow delivered by a projectile when instantaneously stopped in its flight is proportional, not to the velocity, but to the velocity multiplied by itself or squared; so that if the velocity be doubled the energy is increased four fold. But the energy is directly derived from the propellant. So that to double the velocity of a bullet one must produce four times the energy, to obtain which the charge must be increased four fold. And one can not have energy forward without energy backward, or recoil. Take a pistol with .750 f. s. velocity, quadruple the charge, and give the new weapon four times the length of the barrel for the gases to expand in, one gets a rifle with twice the velocity obtained by the pistol, or 1500 f. s.; but one also increases the recoil to such an extent that if a rifle were held like a pistol it would fly back into the face of the firer.

A circular percussion table in operation at the Argent mine, Tasmania, consists of a cast-iron table 13 feet in diameter, convex in form, turned smooth on the surface, and vibrated by cams worked by a shaft underneath. The separation of the minerals from the gangue is by means of water currents supplied by a curved water pipe, revolved slowly over the surface of the table, receptacles at the outer rim of the table receiving the several grades of concentrates. The ore is fed onto the table with water and runs in a curved direction toward the outer edge of the table. On its way the stream is reduced in velocity and depth to about one-third, owing to the greater surface covered, causing a separation of the lighter and heavier particles; the former leave the table at once, while the latter are further separated by passing under the stream of water from the rotating curved water pipe, which, assisted by the vibrations of the table, with gradually increasing energy and velocity, separates the various materials according to their specific gravity and washes them into the rotating delivery receptacles, and thence into circular troughs which collect the different sorts. Daily capacity of this machine is twelve tons.

A Cigale, Utah, querist who asked some time ago, "Is magnetism a separate and distinct force from electricity?" impatiently asks, "How long does it take to get an answer through 'Concentrates,' and why don't you answer my question?" "Concentrates" humbly confesses inability in this case as in others to successfully answer the inquiry, hesitating to rush in where angels fear to tread. Magnetism is considered to be "a separate and distinct force from electricity." Among points of difference, magnetism, unlike heat, light or statical electricity, affords no phenomena immediately addressed to the senses. Those words "magnetism" and "electricity" are only words used to connect cause and effect, convenient expressions to conceal our ignorance. We give names to nature's forces, but can do no more. "Electricity" is not a thing, but a force; it is called static electricity when stored up as idle, though then energy ready for doing work; while doing work it is called dynamic electricity. The other invisible, intangible manifestation that we call "magnetism" is "separate and distinct" from electricity, yet creatable thereby. The magnetic effect produced by electrical induction is the seat and center of all our electrical industries, telegraph, telephone, power and light. Like heat, light and electricity, magnetism is susceptible of being called into action at any time when subject to the right tests. To explain these manifestations of energy is a gift not vouchsafed to any one. It may be that they are all one force appearing in different forms.

The Boise (Idaho) Basin Mining District.

Written for the MINING AND SCIENTIFIC PRESS
by ROBT. NYE, E. M.

Among the famous old-time mining districts which have recently entered upon a period of increased activity, few have had a more interesting past than Boise Basin. In the report of the U. S. Geological Survey this district is called Idaho Basin, but Boise Basin is the name by which it is known throughout Idaho and the West generally.

Boise Basin includes the headwaters of Moore creek and its tributaries, which empty into the Boise river about 18 miles above the city of Boise. It is about 30 miles northeast of Boise, the nearest railroad station and supply point. The gold-producing area of the basin does not exceed 150 square miles. Its length from north to south is 15 miles and its greatest width about 13 miles.

Few districts have produced more gold in proportion to its size. The best and most conservative estimates of the production from 1862 up to the present place it at $100,000,000. Unfortunately, no accurate records were kept during the first ten years, when the output was at the high water mark, and consequently the estimates made can never be positively proven. Of the total output, not over 5% came from the quartz mines and the balance from the placers.

Gold was first discovered near the present site of Pioneerville in August, 1862, and before the end of the year the rich gravels near Centerville, Idaho City, Placerville and Granite Creek had been found. The reports of these discoveries soon spread and the influx of miners was so rapid that in a few years the basin had a population reported to be in excess of 40,000. As is usual with placer mining camps, the greatest production was reached during the first ten years. After that period the output and population gradually decreased and reached its lowest ebb about 1896 and 1897. Since then, owing to the introduction of dredgers to work the low ground which could not be profitably worked by the old methods, and the interesting of outside capital in some of the quartz mines, a great improvement and increased activity along all lines have occurred.

Idaho City, the county seat of Boise county, is 36 miles northeast from Boise, over good mountain roads. Centerville, Placerville and Quartzburg are respectively 8, 12 and 16 miles west of Idaho City. Pioneerville is 5 miles north of Centerville. Idaho City and Placerville each have about 500 inhabitants, while the total population of the basin is probably 1600 to 1800. A daily stage from Boise reaches all the basin towns, carrying mail, express and passengers. Quartzburg, the end of the line, is reached in about thirteen hours' ride from Boise. All basin towns are also connected with Boise by telephone. Freight from Boise is hauled to all basin points for from 65 cents to $1 per 100 pounds, depending upon the time of year and the consequent condition of the roads.

The elevation at Centerville, the most centrally located of the basin towns, is about 4200 feet above sea level. The summits of the gently sloping hills which comprise most of the area of the basin are from 100 to 800 feet higher, while the higher peaks of the chains of mountains surrounding the basin, and forming the rim of it, are from 7000 to 8000 feet high. The hills and mountains are almost completely covered with a splendid growth of pine, fir and tamarack, insuring a bountiful supply of cheap fuel and lumber for many years to come. Over large areas there is very little underbrush, and the grassy, tree-covered hills present the appearance of an immense park without a keeper.

The climate is unsurpassed throughout the world. In summer the days are warm and the atmosphere clear, dry and bracing. The nights are always cool enough to make two or more pairs of blankets a comfortable covering. The winters are generally mild, with a very heavy snowfall, the snow often lying 4 to 6 feet deep upon the level. The almost entire absence of wind prevents the snow from drifting and roads are easily kept open. Snowslides are unheard of, even in the precipitous mountains of the basin's rim.

The geology of the basin is most interesting and far from simple. The country rock is a soft, micaceous gray granite, which decomposes rapidly upon exposure to air and water. It has been referred to the Archæan period, but some geologists find reasons for considering it of a later period. The lower valley of Moore creek and Grimes creek for several miles above its junction with Moore creek was filled with a basalt flow which was contemporaneous with the flows of the Boise and Snake rivers, and which occurred in Neocene times. The present streams have eroded their channels entirely through the basalt, which is left as perpendicular cliffs on each side, forming a good example of a canyon within a valley.

Occasional porphyry dikes occur throughout the basin, and a large porphyritic belt extends from a point about 1½ miles southwest of Quartzburg in a northeasterly course along the rim of the basin to Grimes Pass, a distance of about 8 miles. Beyond Grimes Pass it has not been traced, although it no doubt extends some distance farther.

The gravels of the streams and their low, flat banks were generally from 2 to 6 feet deep, and consisted principally of granite, porphyry and quartz cobbles and boulders and sand of the same material. Few of the boulders are over 8 inches in diameter, and not over 10% of them are over 4 inches in diameter. From 10 to 60 feet above these stream gravels are bars or benches of gravel of the same material and character. Sometimes several of these parallel benches occur one above the other. The stream gravels and bench gravels were almost without exception very rich. In places the stream gravels were worked, but as they were low and flat the bench gravels were easier and more profitable to work, and were attacked first, and the tailings from these bench deposits, which have been for the most part worked out, have covered large areas of the rich virgin stream gravels to a depth of 10 to 40 feet. In some cases the lower benches have been covered with the tailings or debris from the higher workings, as well as the original stream beds.

In places large deposits of auriferous gravel occur several hundred feet above the creek beds. These deposits, while like those lower down, no doubt indicate a former position of the streams, and are unmistakably much older and are ascribed to the Neocene period, while the stream gravels and lower benches are Pleistocene. The gravel of these deposits is all rounded and much water worn. Besides these former channels of the streams, many gulches have been found to be exceedingly rich, the gold of which was found in a few feet of sandy soil and angular gravel, which showed little signs of erosion. Such gulches invariably lead up to some quartz ledge, and most of the richest quartz mines of the basin were discovered in this way, as few of them outcrop.

The stream gravels rest upon the granite, generally, but on Moore creek for several miles below Idaho City, and for a short distance above, they rest upon a soft, sedimentary deposit of sand and clay, which the miners term false bedrock. This deposit, which contains little or no gold, was doubtless laid down upon the bottom of a large fresh water lake, as it bears no signs of having been deposited in flowing water. Smaller patches of these lake beds occur near Centerville and Placerville.

One of the most interesting occurrences is that of a heavy yellow sand that hangs back with the black sand and gold in the sluice boxes. This has been determined as monazite, and it is believed to be the only place this comparatively rare mineral has been found in the Western States. There is no doubt but that it is an original mineral in the granite of the basin.

Seldom have extensive placer deposits been more easily and certainly traced to their source than in this district. Quartz veins, mostly small but many of them very rich, occur throughout the basin. Two well-defined gold quartz belts, however, may be considered with some certainty as the principal source of the gold in the placers. The first and largest is closely identified with the porphyrite belt, which extends from near Quartzburg to Grimes Pass. The veins occur in the porphyrite or near its contact with the granite. In this belt lie the Ebenezer, Gold Hill, Iowa, Morning Star and other well-known mines. In the Gold Hill the pay ore was in places 40 feet wide. The other belt extends from Gambrinus and Illinois gulches, about 5 miles east of Idaho City, in a northwesterly course several miles to the Elkhorn mine on Elk creek. Every stream and gulch heading in or crossing either of these belts has been rich, and streams and gulches not crossing either of these belts have carried little gold, except in cases where an isolated gulch that was rich led up to a quartz ledge which did not belong to either belt.

The water supply for hydraulicking is limited and the season is consequently a short one, ranging from three to four months. A few mines have water for five or six months.

The old Plowman claim, near Idaho City, operated by the War Eagle M. Co., has the largest water supply, usually getting four to five months' run, with over 2000 inches of water. Their mine is the best equipped in the basin. They are using four giants against a bank which is now about 100 feet high. About two-thirds of the bank is gravel and one-third clay. The clay caves off in large boulders, which have to be blasted, many of them before they can be handled. This is the only placer mine in the district where blasting is necessary.

The only large tract of good gravel remaining near Centerville is owned and worked by Oaks & Smith and the Wong Sing Co. This ground, owing to the abundant water supply and the absence of clay and cement, can be worked at a less cost per yard than any ground in the basin.

The richest ground in the district, probably, is that owned by Leary & Reed, near Placerville. Considerable amounts of cement and a low head of water reduce the production here.

A Boston company, under the management of Mr. Kirkpatrick, is operating a good hydraulic plant on Fall creek, and the Pioneer Gold Gravel Co. has a large amount of ground near Pioneerville, which it leases in small tracts. Besides those mentioned, a large number of smaller workings add materially to the total output.

The large profits made by some of the gold dredgers in Montana and California caused a sudden demand for good dredging ground, and the broad, flat, debris-covered valleys of Moore, Grimes, Granite and Wolf creeks received early attention. In 1897 and 1898 large tracts of these creek bottoms were prospected and much of them found to be rich. The abundance of water for dredging purposes, the absence of clay, cement and large boulders and the soft, easily cleaned bedrock make it ideal dredging ground.

The Risdon Iron Works put in one of their dredgers on Moore creek for the Boston & Idaho Dredging Co., which has been operating seven to eight months a year since 1898, and proved very successful. The latter company last year built a dipper dredger of their own design, which is now working satisfactorily. The Boise Dredging Co., Bedrock Dredging Co. and Bullion Dredging Co., all under the same management, each have a dredger. Those of the first two named ran part of the season of 1899 and proved the value of their ground, but the dredgers have been idle this season and will be largely rebuilt before they run again. The boat of the Bullion Dredging Co., built after the same design as the other two, is not yet finished.

The natural conditions for dredging on all the creeks named are practically identical, and experience has proven that all ground yielding over 6 cents per cubic yard can be worked at a profit. There is probably enough ground along these creeks to keep six to ten dredgers busy for ten years each. The dredging season is seven to eight months a year.

While the discovery of rich, free milling surface ore in a number of quartz veins followed very shortly the discovery of placer gold, very little thorough, systematic development of the quartz mines has been done until very recently. In spite of this fact, however, a number of the basin quartz mines have good records of production. The Gold Hill and Pioneer claims, near Quartzburg, worked as one mine, produced $2,225,000 in a few years and the shaft is now down only 425 feet. It is claimed that there was good ore in the bottom level when litigation stopped operations. The Iowa, in the same neighborhood, produced over $200,000 before the War Eagle M. Co. took hold of it a few months ago. It is now being equipped with a modern 30-stamp amalgamation and concentration mill, and a chlorination mill to treat the concentrates. The Elkhorn mine, on Elk creek, produced over $500,000, but recent work upon it has proved unprofitable up to the present time. The Illinois and Gambrinus mines, about 5 miles northeast of Idaho City, are credited with a production of $225,000 and $263,000, respectively, but are not now being worked. Perhaps half a dozen other mines have produced from $25,000 to $100,000, while the number which have produced smaller amounts is large.

The veins occur in the granite and associated porphyry dikes, and their chief characteristics are generally similar. For the most part they are zones of sheeted granite or porphyry, filled with many small seams of quartz carrying free gold, pyrite, arsenopyrite and zincblende scattered through them. The walls for some distance from the veins are usually much altered. The rock of the veins and walls is usually soft and heavy and requires substantial timbering. The country rock is soft and, while drilling and breaking easily, usually stands well and crosscut drifts and tunnels seldom need timbering.

The surface ores are free milling, but below the permanent water level, usually found at a short distance from the surface, the values often lie principally in the sulphides and a high percentage of extraction cannot be obtained by simple amalgamation. The present freight and smelter charges at the nearest smelters amount to about $40 per ton, prohibiting the shipping of any but high-grade concentrates or ore. The almost entire absence of lead and copper in the ores, and the absence of suitable fluxes in the immediate vicinity, puts smelting out of the question. The most promising process seems to be that adopted by the War Eagle M. Co., previously mentioned, and their work is being watched with a great deal of interest by all mining men of the district.

While most of the few hydraulic mines now being operated will continue to be profitable for many years to come, no new discoveries of hydraulic mines can be looked for. All new development must come from the large areas of dredging ground and the quartz veins. While no rush or boom is expected or desired, work already planned and started insures a steady growth and improvement.

Little has been written about this district, but a large amount of valuable information about it can be found in the monograph of Prof. Waldemar Lindgren, entitled "The Mining Districts of the Idaho Basin and the Boise Ridge, Idaho," and published as a part of the Eighteenth Annual Report of the U. S. Geological Survey in 1898.

RUSSIA'S production of petroleum during 1899 was the greatest ever known and paid best. The revenue of the Russian Government from the excise duty on refined petroleum amounted to nearly $14,000,000 in 1899—an increase of $1,500,000 over 1898. Eight years ago crude oil was selling at Baku at 1½ to 2 cents per pood of thirty-six pounds. During 1899 the average price of crude oil was about 7 cents per pood, and during the last two or three months the raw material was bringing 9 to 10 cents per pood, with a corresponding rise in the price of other petroleum products.

Gas Engine Economy.

Although the gas engine has made rapid progress during the last decade, and the improvements that have been developed have increased both the efficiency of the engine and its steadiness of running, there yet remains a field for improvement that includes within its bounds great possibilities. The gas engine, as it stands to-day, is by no means the engine it is likely to be a dozen years hence. It has many faults. These are, indeed, counterbalanced by its many virtues, and for that reason the faults are overlooked in extolling its merits. There is nothing better than competition to spur inventions and improvements, and the rapidity with which the power-using public is taking up the gas engine augurs well for its future.

To begin with, the gas engine as built at present has a terminal pressure within the cylinder averaging about thirty-five pounds to the square inch. If products of combustion are allowed to leave the exhaust pipe at this pressure, the resultant noise is so great as to constitute an objectionable feature. Therefore, the exhaust is led through a series of tortuous passages in order to quiet it, with the result that the back pressure in the engine is increased, with a consequent loss of power in the engine. Although the compound engine and the variable-stroke engine have been tried and abandoned, the writer believes that there is ample opportunity for improvement in this respect. An increase in the expansion would give at least 10% increase in power for the same fuel consumption, when employing the compression pressures now in general use. There would also be absence of noise, as the terminal pressure could, in all likelihood, be brought to within four or five pounds of that of the atmosphere.

It is not realized by every gas engine manufacturer that the advantages of the multiple-cylinder engine are numerous. In the first place, an increase in the number of cylinders is conducive to steady running, as is generally admitted. The decrease in the necessary weight of the flywheel is not only of advantage in the saving of iron, but it also reduces the friction of the engine to a marked degree, and, consequently, increases the mechanical efficiency of the engine. In a multiple-cylinder engine there are opportunities for balancing which are lost sight of by the majority of designers, and much has been done in this line in a hit-and-miss sort of way. There is much literature on the subject of balancing, and very few writers agree as to proper methods. In fact, the gas engine builder quite frequently has derived an empirical formula of his own which gives results that are, in his estimation, good enough, but by no means perfect.

There is also a chance for improvement in the handling of the water that passes through the water jacket. In factory tests it has been found that the best results were obtainable when the temperature of the water of the water jacket was 150° Fahrenheit, this temperature varying in different engines. But the writer has yet to see a single gas-engine instruction sheet in which this fact is mentioned. In fact, no attention whatever is paid to the jacket water after the engine leaves the factory. Now, why should this be so? Is it because the gas engine is the motive power for the ignorant or the indolent? The writer admits that this matter does not assume great proportions in the engines of small dimensions; but the question arises: would it not pay to employ a temperature regulator on the engine that would control the temperature of the engine cylinder by means of the water supply? It would be absolutely useless to leave this regulation to the engineer unless the engine were operating under a comparatively constant load, for with a diminution of the load the water supply should be decreased, and vice versa.

The question of high compression is a matter that is a puzzle to the average gas-engine builder. The writer has quite frequently been asked for his opinion on this question, and usually with an inflection that showed plainly the questioner's aversion to increase of compression pressures. And why this aversion? The answer is not hard to give. The gas-engine builder who already has an established line of patterns and has tools, templets, etc., which are adapted to the particular designs which he has in hand, finds that to increase the compression means a necessary strengthening of his engine in almost every part. It is notorious that the average gas engine is seldom built too strong for its work, and an increase in compression is, perhaps, a harbinger of frequent breakdowns. There is, however, no reason that when a new design is contemplated it should not be so proportioned that it can withstand the increased pressure.

With increased compression comes the danger of premature ignitions, commonly known as "back-firing," and there is a limit to compression for each fuel employed which depends almost entirely upon the ignition temperature of that fuel. For this reason compression can not be carried to so high a temperature when gasoline is the fuel employed as when the fuel is natural or artificial gas. Gases rich in hydrogen—as those made by the water gas process—are also an obstacle to high compression. The compression of a charge of pure air and the subsequent introduction of the fuel at the end of the compression is a method that overcomes this difficulty, but is covered with patents, and can not be employed by the gas engine manufacturer without the payment of royalties. The subject is one that has been given considerable attention by a prominent firm of gas-engine builders, and the results obtained indicate that the subject is one worthy of consideration, and that an increase in compression carries with it an increased economy of fuel consumption.

A matter which appears to have but little attention from the gas-engine designer is the proportions of the inlet and exhaust passages. These are too frequently made much smaller than they should be, and often without apparent reason. In a series of engines recently examined by the writer, no regularity of proportion was apparent, as the ratios of the passages to the volumes of the cylinder and the piston speed were the same in only a few instances. The designer did not seem to realize that throttling the air as it entered the engine would reduce the volume of the charge, nor that an obstructed exhaust would increase the back pressure on the piston. In several cases the valve openings were ample, but the port leading from the valve box to the cylinder was contracted, although there was more than enough room to have it made larger. There is another class of designers who give both valve openings the same area, while the usual excuse for this is that if the exhaust valve is big enough the other is also; yet it seems to the writer that it is a confession of inability to decide what is the better size in either case. To make the valves big enough is all well and good, but there is a practical limit beyond which it is always foolish to go, as to make the valves or passages larger than necessary requires an unnecessary expenditure in the manufacture. Fortunately or unfortunately, the upper limit is not very often passed, and it is found in practice that the engine could be much improved by increasing the inlet and the outlet passages.

There is still another question that bears very strongly on the economy of the gas engine, and that is the question of load. All gas engines give their best performance at nearly full load. There are but few power requirements in which the engine would run at its full load for the major portion of the time it is in use. The engine is guaranteed to produce a horse power on so much fuel per hour, and it does very nicely when the load is that at which the engine is rated; but let the load fall off 50% or more, and note the enormous falling off in economy. But how avoid it? The problem is nicely met by dividing the load between several engines. Thus, if the maximum load is 50 H. P., install a 20 and a 30 H. P. engine. When the load is one-half of the total and not more than three-fifths, the larger engine may be employed. When the load drops below two-fifths of the whole, the smaller engine may be employed, and when the power requirement is too great for the larger engine both may be used together. Of course, this plan is not practical when the load is changing between wide limits in a short interval of time, but there are many cases where it may be applied. A plan which is better adapted to the latter case, and where the requirements for speed regulation are such as to permit its use, is to employ a multiple-cylinder engine and govern it by cutting out one cylinder at a time, instead of having the impulses stopped on all the cylinders at the same time. This plan is already in use, and it is understood to be a success.

In all gas engines, and in gasoline and oil engines especially, the combustion of the fuel is a point that may be well looked after. Imperfect mixtures, especially those which are too rich in fuel, often result in the discharge of unburned material into the exhaust passages. The best way to determine the state of the mixture in the gas engine cylinder while the engine is running is to place a small pet cock on the cylinder in such a position that it opens directly into the compression space. When this pet cock is open and a part of the mixture allowed to escape at the time of the explosion, the color of flame gives a good indication of the proportion of gas in the charge. If this proportion is about right, the flame will be a deep blue, similar to that at the base of a Bunsen flame, while should the proportion of gas be too great the point and the edges of the flame will be tinged with orange. And this, by the way, is a very simple method for determining the proper opening of the gas valve.

While the maximum economy of the engine is obtained when the engine is giving nearly all the power that can be obtained from it, the point of least fuel consumption lies somewhere just below the point of greatest power. The mixture which will develop the highest mean effective pressure does not of necessity waste the least gas. It is, therefore, well to determine the point of greatest economy, and to so proportion the engine that the load it is required to carry is as nearly as possible at this point.—E. W. Roberts, in The Gas Engine.

TALKING of miners' drilling contests, the Telluride, Colo., Journal says this thing of drilling straight down holes in every match is getting monotonous and is not the drawing card that it was a few years ago. Why not have uppers, roof and breast drilling? This is what will test a miner's skill. Not one hole in 1000 in mining is a down hole. Next year some scheme should be devised for raising the rock on a scaffold and letting the contestants go up into it from underneath. This test will bar not a few who tackle the down holes in the hope of getting a piece of the money, and will also give strangers an idea of what mining is like.

The Copper Deposits of Southwestern Nevada.*

Written for the MINING AND SCIENTIFIC PRESS by E. MCCORMICK.

The existence of deposits of copper-bearing mineral of some magnitude in southwestern Nevada has long been known to the mining world, but the first attempt at systematic exploration of any of these deposits is believed to be the series of mining operations now being conducted by the Vulcan Copper M. & S. Co., in Santa Fe mining district, Esmeralda county.

The Vulcan Co. own and are exploring three groups of claims, namely, John L., New York and Parrot. Their operations at the present time are concentrated upon the latter group, which comprises the following claims: Kearsarge, Parrot, Phœnix, Dewey, Bowler, Powell, Lena May, Nora K. and Schley.

This group of claims is situated 5 miles northeast of Luning, on the line of the Carson & Colorado R. R., the workings being located in the mouth of a canyon at an altitude of about 5000 feet above sea level and some 700 feet above the plain or flat below.

The geology of this section is similar to that of all the "basin region," the surface of which was formed by the drying up of former great lakes. The country rock is magnesian limestone, the mine being a contact between the limestone on the north and porphyry on the south. This eruptive rock has broken up through the limestone and can be traced on the surface for a considerable distance. One result of this disturbance has been extensive fissuring, and through the bedding planes ore solutions have circulated, replacing the limestone in part with bodies of sulphides, which afterward have become oxidized by the oxidizing and hydrating action of atmospheric waters. As a consequence we find the surface bearing zone consisting of siliceous and magnesian gangue, impregnated and coated with chrysocolla and malachite. Owing to the metamorphic action following the intrusion of the eruptive rocks, the magnesia of the limestone has been converted to the silicate and as such is found as a coating on the sides of the fissure. The surface croppings, from all indications, are simply the result of the solutions from the main fissure following the shortest course to the surface.

The property has from the first been carefully and systematically developed, the object being to ascertain the full extent of the ore body and put it in condition to be a steady producer. There are a number of surface inclines, shafts and excavations on the property, from which good ore has been taken and now lies on the dump ready for shipment, as illustrated herewith.

A double compartment shaft has been sunk to the 300-foot level, and levels extended from same at the 100 and 200-foot points, cutting a shoot of ore 40 feet wide that averages 5.22% copper, 3 ozs. silver and 1 oz. gold. At present the hoisting is effected by a gasoline engine of the two-cylinder type, built by the Union Gas Engine Co. of San Francisco, about 200 tons being hoisted daily.

For fuel supply for steam and smelting, the company has secured the coal deposits at Columbus, distance 40 miles from the mine, and are now exploring same both with a view to their own consumption and introduction into adjacent markets. With the blowing in of the smelter and the successful issue of the Vulcan Co.'s enterprises, this hitherto neglected section of Nevada should take on a more prosperous appearance.

* See illustrations, front page.

Ventilation of Mines.

W. E. Mead of Ward, Colo., tells the Miner that it is simply a matter of timbering to have good air in the breast of any tunnel or in the bottom of any shaft, as well as through every drift and stope in any mine. It will cost a little more, but not nearly as much as will be gained by the extra work obtained from men working in good clean air instead of air charged with powder fumes. Motion in air is caused by difference in pressure, and this can be obtained by heat or by some artificial means. Box up the skip or cage way and the travel of the skip or cage will clear the bottom of the shaft, acting like the sucker in a pump. If one has a tunnel of any considerable length, make it double track and partition between the tracks; run the cars up one side and down the other, and have clear air at the breast. If a fan is used, have a suction fan; it will draw out the gases. A blower only mixes these gases up; it does not remove them. If the air hangs dead in the bottom of the shaft, hang a fire pot in the air shaft and the trouble is instantly removed. The difference in work obtained from working in clear air over air that is foul is frequently 50%, while it is merely a matter of lumber partitions and bulkhead to ventilate every part of a mine.

Power Generation.*

There is no question of greater importance at the present moment to those engaged in the management of our manufacturing industries than that of power generation. The supremacy which the steam engine has long enjoyed is now assailed from two sides. The water turbine and the gas engine have become dangerous rivals.

During the past ten years a most remarkable development of hydraulic power has been taking place on the continent of Europe in France and Germany, and in America at Niagara.

The aggregate amount of power at the present date generated from falling water forms no inconsiderable portion of the total power utilized in manufacturing industries; and two years ago it was estimated by the author to be between 236,000 and 350,000 H. P.

On the other hand, gas engineers have been busily engaged in working out the problems presented by large gas engines and by the utilization of the waste gases of blast furnaces.

Gas engines up to 650 H. P. have been built, and have worked smoothly and economically; while at Seraing in Belgium and at other places the blast furnace gases have been utilized for driving the engines which supply the blast.

The question, therefore, which the engineer now has to settle when deciding upon the site and locality for a new factory, or when deciding upon the system of power generation to adopt for extensions of the old, is no longer so simple as when only one method of power generation in large units was open to him.

It is no doubt true that the choice between the three possible sources of power is one which in many cases will be settled purely by local considerations; and the proximity of a large waterfall or of an extensive coal field to the factory will be held to point to the turbine or to the steam engine as the most economical power generator. In a great number of cases, however, especially when the decision of the engineer covers the choice of a site for the factory, the problem is capable of no such easy solution; and the most economical source of power can only be determined after an exhaustive study of comparative costs data.

The aim of the writer in the present paper has been to collect and arrange in comparable form some of the more important figures bearing on the cost of power generation.

(Tables I to VI in original article contain details of sixty-five actual or estimated costs of steam, water or gas power per H. P. year of 8760 hours.)

Taking the best figures of each of the three sources of power dealt with above, and bringing them all to a common basis of comparison, namely, the cost of the E. H. P. year of 8760 hours, the author obtained the figures given in the following table:

TABLE VII.—COMPARATIVE COSTS OF ELECTRICAL POWER.

Source of power.	Lowest cost per E. H. P. year of 8760 hours.			
	Estimated	Locality.	Actual	Locality.
	£ s. d.		£ s. d.	
Water....	1 5 5	Canada.	1 19 0	Switzerland.
Steam....	4 18 8	North England.	4 9 7	United States.
Gas (producer)..	5 0 0	England.	......	....
Gas (blast furnace)	4 1 7	Germany.	......	....

The figures in the table support the opinion, now generally held, that water when developed without excessive capital expenditure is the cheapest source of mechanical or electrical energy. When, however, the hydraulic engineering expenditure has been heavy, or when the power after generation has required to be transmitted over long distances, the margin between the relative costs of water and steam power is greatly narrowed, and in some cases disappears.

Electrical energy generated by falling water is costing more at Rheinfelden, at Zurich, and at Buffalo than it would cost in South Lancashire if generated by steam power in large units, and the margin between the actual charge for power at Niagara and the estimated cost of steam power in large generating stations in South Lancashire is only 12s 1d E. H. P. year.

In this connection it is interesting to note that the charge for electric power in Buffalo is 13s 6d per E. H. P. year higher than at Niagara; and the excessive charge to small consumers in the same city (£25 11s per E. H. P. year) would seem to indicate that the cost of transmission between Niagara and Buffalo represents at least 20s per E. H. P. year on the power sent into that city.

Turning now to a consideration of the relative position of gas power, the question of the practicability of large engines may be taken as settled. If they do not cost excessive sums for maintenance and repairs, large gas engines, in conjunction with coke ovens and blast furnaces, may entirely alter the present position of affairs; and the new industries which at present are being established in the neighborhood of water power stations may find themselves in severe competition with similar manufactures carried on in the coal and iron districts of the older manufacturing countries.

It has been calculated that 2,000,000 H. P. is annually wasted in the gases issuing from the blast furnaces of the United Kingdom. If these waste gases could be industrially utilized in the manner suggested we should to a large extent be compensated for our lack of natural water power.

But blast furnaces demand coke, and coal beds are exhaustible, so that even if this source of mechanical and electrical energy be tapped it can only postpone, but not avert, the final triumph of the waterfall and of the turbine.

Use Made of Some Metals.

With lead by far the greater portion is converted into white lead, red lead and orange material, which are used as pigments of paints, distributed over great surfaces in such thin coatings that their metallic contents is practically never recovered. A good deal of lead is manufactured into sheet, and a considerable proportion into bullets, shot and other projectiles; and, though still remaining in a metallic form, it is so widely distributed in use as to cause it to be irrecoverable in the form of scrap. A portion of the lead product used as sheet lead and pipe does come back into the market, but the portion of lead used in these ways is comparatively small as compared with the other uses of the metal.

The consumption of zinc is largely in galvanizing steel or iron sheets, in the manufacture of brass, as sheet zinc, and as the oxide of zinc used as a pigment in paint. That portion of the metal which is used in galvanizing is distributed as a thin covering over a large surface of iron, and the metal is entirely lost in the oxidizing and general disintegration of the zinc sheet. It has never been attempted to recover the zinc from galvanized iron. Zinc which is manufactured into brass, in the proportion of one-third zinc to two-thirds copper, remains in a permanent form, which is often available for new use as scrap brass, and, next to iron and steel, is the largest commodity in the scrap metal market.

The major portion of the tin product of the world is used in covering tin plates. Ordinary tin plates carry 1½% to 3½% of tin. Many attempts have been made to recover this tin from old tin scrap, but no considerable amount of metal has thus returned to the markets of the world as recovered from tin scrap up to the present time.

Of the common metals next to iron and steel, copper is the one which is used to the largest extent in the metallic form, only a small proportion of the production being utilized in the salts of copper, blue vitriol (the salt of copper used in galvanic batteries) being the principal salt of the metal sold in the market. The great uses of copper are in the manufacture of brass, of which it forms a two-thirds component part ordinarily, and in electrical conductors and in the form of sheet used in roofing, the bottoms of cooking and other utensils, in the manufacture of pipes to be used where a considerable amount of elasticity and pliability are required. The proportion of scrap copper for sale in the market is greater than that of any other metals, with the exception of iron and steel; but the total amount of old copper offered for sale is comparatively insignificant compared with the total copper production.

Demand for Mining Machinery

Dealers in mining machinery report that the outlook for a first-class fall trade was never before so good. Within the coming month mining men who have been busy all summer with development work will begin to arrive in this city with their plans for future improvement. Mining is necessarily a progressive industry. No practical miner would put a $30,000 first-motion hoist over a 10-foot prospect hole, and, on the other hand, no one who has a fair idea of economic principles will continue to hoist ore from a depth of 250 feet with a windlass or whim. The result is that the almost constant purchase of machinery is necessary. The machine that was ahead of the requirements last year may be behind to-day. These purchases are generally made in the fall and winter, after the summer's work has shown what is necessary, and there is no more certain indication of a prosperous and successful season than a brisk trade in mining machinery. Conditions are more favorable to buyers than they were a year ago. Then every factory in the United States was crowded to its utmost capacity and the miner who succeeded in getting his order filled within four months was fortunate. This condition has been greatly improved during the last year. Nearly every prominent manufactory of mining machinery in the country has had its capacity increased. The remarkable increase in the demand for mining machinery during the past three or four years has induced most of the leading firms to create special mining departments, and one firm has found it necessary not only to build a new factory in this country, but to establish a branch factory in Canada for the special purpose of supplying Canadian miners without straining the capacity of the main establishment. All of these improvements in the manufacturing situation have materially relieved the pressure so that miners who place their orders now have a reasonable assurance of prompt service, and very many who have been holding off and getting along as well as they could with their old machines are now putting in their orders.—Denver, Colo., Republican.

A Large Enterprise.

At Sault Sainte Marie, Ontario, F. H. Clergue and associates have an extensive project. A few years ago, at the lower end of Lake Superior, they cut a canal that furnished 10,000 H. P. for electrical energy, but when they wanted to sell the power they found no takers. To save the original investment they were forced to change their policy, utilize it themselves, and find a means for development. The first enterprise was a spruce pulp mill, now making a product that sells for $900,000 a year, and fixes the price for paper pulp.

Mechanical pulp is worth $30 a ton, sulphite pulp, wood treated chemically, is worth more; the company decided to make this also, and the largest sulphite mill in the world is nearing completion, for sulphite pulp sulphur is necessary. The Sudbury works of the Canadian Copper Co. are expected to furnish considerable sulphur as a by-product. Sudbury is 100 miles from the Sault, and produces a good deal of nickel. The nickel ore mined there is nickeliferous pyrrhotite, containing nickel, sulphur and iron. At the matte furnaces of the Canadian Copper Co. they are saving nickel, but the sulphur and iron are not utilized. Mr. Clergue thinks he can make a commercial product from roasting pyrrhotite. His company have bought a nickel mine near Sudbury for the sulphur, and are building the Manitoulin & North Shore Railway to and through the nickel belt and on to Georgian bay.

With the extraction of sulphur from the pyrrhotite, there is left a ferro-nickel ore, with possibilities for the manufacture of nickel-steel. The company proposes the utilization of this ore, and claims to be able to accomplish reduction on an economical scale of ores of iron into steel by electricity. Furnaces are devised that to the extent of a five-ton unit have smelted this soft, high nickel ore into nickel-steel, sufficient iron ore being added to the mixture to make a hard steel. The nickel percentage of their ferro-nickel was so great that the resulting steel was very soft, it being a peculiar feature of nickel that a percentage of about five or six makes the alloy soft, while a percentage of three or thereabouts makes an armor plate. The company has a machine shop and the hard cutting tools used there are made of its own nickel-steel smelted in its own furnaces by electricity. The plans for the ferro-nickel works propose 100 furnaces of five tons daily capacity each.

To the company the Dominion and Ontario governments have given grants of money and lands. The lands include 1,650,000 acres for a road running from the Sault to Missinable on the Canadian Pacific Railroad, 150 miles northerly. The Dominion has given cash subsidies for an extension of the road to Hudson bay in five years an additional grant of $500,000 and 1,250,000 acres have been offered. The lands of these grants are not to be selected in one bunch, but within a reasonable distance of the lines of the road, in small blocks. To avail itself of this privilege the company has timber cruisers, mineralogists and geologists traversing that region, each party of two men accompanied by Indian guides and canoemen, selecting timber lands, running out geological formations, verifying and correcting old surveys; the grants will be selected under their reports.

Clarke & Co. of Toronto formulate an extensive program, the details of which remain to be confirmed.

IF two clocks on the same shelf have their pendulums adjusted to swing in exact unison, and one of them is set to running, in the course of time the other will start up in sympathy. Each sound impulse caused by the vibration of the pendulum of the clock that is running is communicated to the other pendulum. Each successive impulse adds to the swing of the sympathetic pendulum, which began in an exceedingly small way at the very first stroke of the other pendulum, and this goes on till the sympathetic pendulum is making its full stroke. So with sympathetic tuning forks. Each air wave that is sent out by the initial fork strikes the other fork and causes at first a slight vibration, which accumulates, because each successive air wave strikes the sympathetic fork just at the end of its swing and works in harmony with the natural tendency of the fork to vibrate. The result is a co-operation. Each helps the other. How much better it would be for the world if men could pattern after this law of physics.

A NEW YORK PAPER says that in that city, located on one of the narrow side streets down town, is a factory in which are made every year more than $100,000 worth of divining rods for use in finding hidden treasures. From this factory alone are turned out and sold each year almost 5000 fake rods, which means that in the rural districts within 200 or 300 miles of the metropolis are found every twelve months that many gullible and ignorant people. These rods are sold at from $15 to $35.

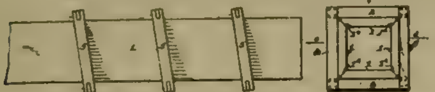
Mining and Metallurgical Patents.

Patents Issued September 25, 1900.

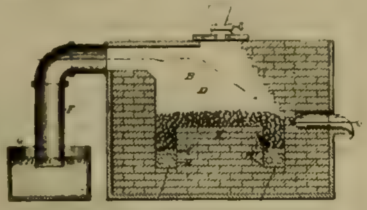
Specially Reported for the Mining and Scientific Press.

Knockdown Flume.—No. 658,332; A. L. Adams, Bridgeport, Conn.



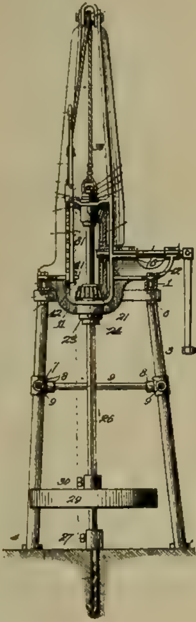
Knockdown flume having three or more sides provided with beveled meeting faces, combined with binder adapted to envelop all sides, means whereby force is applied to one or more sides to produce resultant force at an angle to initial force so as to crowd remaining sides of flume hard against binder and thus firmly lock the whole structure together.

Method of Treating Ores.—No. 658,412; G. M. Westman, New York.



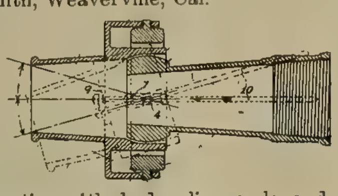
Process of treating arsenical ores which consists in melting the ores by passage of electric currents therethrough, thereby vaporizing arsenic, cooling portions of electrodes maintaining portions of electrodes intervening between ore and cooled portions in melted condition and collecting precious metals in such melted portions.

Drilling Machine.—No. 658,447; A. E. & C. A. Jordan, Buel, Kans.



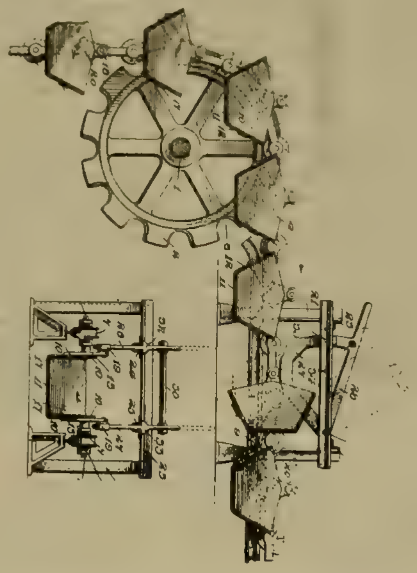
Drilling machine, comprising frame or stand, consisting of bars bent to form parallel horizontal portions and depending or leg portions, also bent to form runners at lower ends of certain legs, rounds or braces connecting legs, cross-bars connecting horizontal bars at under side and junction with depending portions, casting mounted upon horizontal bars, sleeve and small wheel journaled in casting one above other, rod extending slidingly through wheel and sleeve adapted to rotate with same, lever suitably mounted, cable suitably guided and connected at one end to lever having swivel connection at opposite end with rod, means to hold lever at desired point of adjustment, drill-bit secured to lower end of rod, shaft geared to wheel, and means to rotate shaft.

Deflector for Hydraulic Nozzles.—No. 658,516; J. W. Smith, Weaverville, Cal.



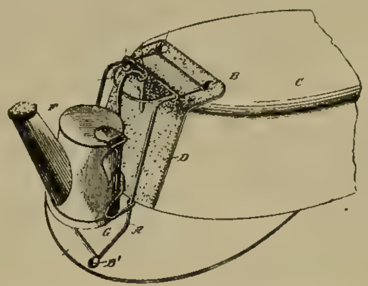
Combination with hydraulic nozzle and discharge pipe of spherical segment fixed to outer end of pipe, supplemental tubular pipe having rear end enlarged and loosely turnable over spherical segment, having open slots at opposite sides, ring of larger diameter, pivot pins connecting rings with interior spherical segment, passing through slots in supplemental pipe, lugs connected with supplemental pipe extending outwardly, thence rearwardly substantially parallel with sides of rear portion of supplemental pipe, pivot pins by which lugs are connected with exterior ring at right angles with its connection to spherical segment, lever whereby supplemental pipe is turnable about either of its pivots with relation to main nozzle.

Pumping Mechanism for Conveyors.—No. 658,656; A. L. Le Grand, West Pittston, Pa.



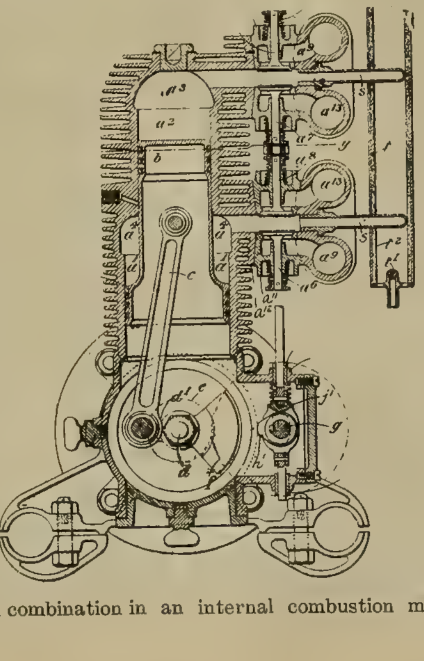
Combination with conveyor comprising pair of chains, gravity buckets located between chains and provided with terminal pintles constituting link-connecting devices for chains, rollers mounted upon each pintle, trip arms extending upwardly from pintles, having terminal anti-friction rollers, dumping station comprising supporting frame and guide bars, pivoted trip comprising pair of depending trip bars guided by guide bars of station arranged to obstruct path of movement of trip rollers, and locking means for retaining trip in operative or inoperative position.

Support for Miners' Lamps.—No. 658,642; C. J. Heckel, Pittsburg, Pa.



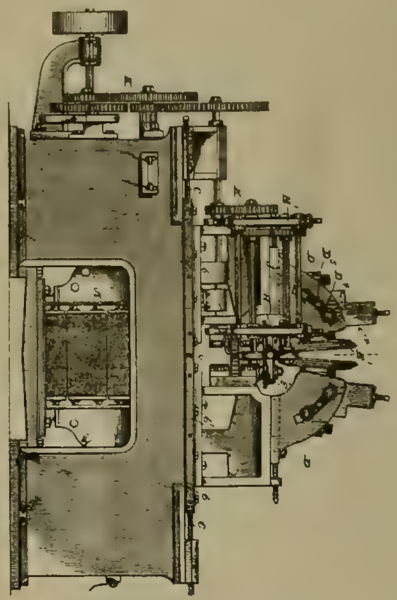
Support for miners' lamps, consisting of wire frame having upper and lower portions bent at an angle projecting in opposite directions, provided in upper portion with eye to receive hook of lamp, segmental guard projecting horizontally forward between members of frame and in front of eye, semicircular socket secured to lower portion of frame and in which lamp body rests.

Internal Combustion Motor.—No. 658,595; W. E. Simpson, London, England.



In combination in an internal combustion motor, cylinder of varying bore, trunk piston to form with cylinder working chambers, connecting rod and valve mechanism with means for controlling same to supply chambers alternately with fuel or to cut off either chamber from its fuel supply and to admit a non-explosive charge to chamber thus cut off, which charge is then compressed to maintain thrust on connecting rod.

Electric Welding Machine.—No. 658,741; O. Parpart, Cleveland, O.



Tube-welding machine, combination of two electric current conducting devices having clear space between each other, respectively connected with opposite electric poles, adapted to have contact respectively with opposite edge portions of butt joint of tube, and two rolls located respectively on opposite sides of conducting devices, adapted to compress tube between them, together with joint guide located in plane passing through clear space between conducting devices and adapted by engagement with joint edges to cause each of such edge portions to have contact with only its appropriate conducting device.

Composition for Converting Iron into Steel.—No. 658,438; E. Hardmeyer, Kokomo, Ind.

Composition of matter for converting iron into steel consisting of albumen 100 pounds, and Epsom salts 15 pounds.

The First Gold Dredging Company in California.

Sacramento City, November 1st, 1850.

No. 70......

This is to Certify that....A. B. Paul....is the owner of one unassessable Share in the Yuba River Gold Dredging Company, subject to the Rules and Regulations in the Constitution. Wait Barton, President.

Almarin B. Paul, Secretary.

Job H. Watson,
William Lowell, Trustees.
Joseph Tryon,

This company, composed of the five names above, put up $25,000, purchased the Linda dredging outfit, brought out from Boston, and went to work on the Yuba river at Oulsley's bar. Joseph Tryon was superintendent. The company worked about six weeks on the bar, but the large rocks encountered made the operation impracticable. Mr. Paul says the company had 100 shares in it, each one of the five owners having twenty shares. Each held and lost all he put in, although before getting to work they were offered $100,000 for all the stock, and refused it.

Russia supplies 94% of all the platinum manufactured, and the Ural platinum industry may be said to monopolize this metal commercially. Up till quite recently this industry was completely dependent upon some few foreign firms, with offices in London or Hamburg and agencies in Russia. There are no installations for handling the metal in Russia, and all the crude platinum has consequently to be transferred to the firms referred to. The export of crude platinum is, however, likely to soon cease altogether, inasmuch as the syndicate of foreign capitalists which has secured the platinum working establishments of the Ural has erected two refineries at Jekaterinenburg. The difference in value between crude and refined platinum is about 100%—9000 to 10,000 roubles per pood, and 15,000 to 20,000 roubles. The syndicate has also secured the crude platinum held by Count P. P. Schuwalow and M. P. P. Demidow, so that the syndicate will handle about 300 poods of crude platinum annually. About 75% of the whole production goes to America, with which country the syndicate intends to enter into direct relations. It is expected that the business will prove a remunerative one.—American Manufacturer.

Gold Sands of the Snake River, Idaho.

In a paper on the "Hydraulic Pumping Plant on the Snake River, Idaho, for Power, Irrigation and the Treatment of Gold Sands," by John Birkinbine, at the Washington meeting of the American Institute of Mining Engineers, he notes the existence of free gold in large quantity, but generally finely comminuted (much of it being float gold), and that the Snake river is actively exploited by dredgers and ground-sluicing. The most desirable deposits of auriferous sands are either above the river level, and unworkable, except by hand labor or by water artificially elevated, or are in bars in the bed of the stream, from which the sand and the water for washing it must be raised by mechanical power. Close to American Falls the territory adjoining the shores is worked at a number of places, the material being handled by scrapers drawn by horses and treated in crude ground sluices with satisfactory results. The present operations are confined to bars, or to localities where the stripping is slight, because the material must be handled by animal labor or by steam dredgers, which latter must pay from $4 to $6 per ton of coal, delivered at the dredgers, of which nearly sixty dredgers are reported at work on the Snake river. Electric power developed at the American Falls may possibly be conveyed to operate dredgers at other points on the river, at rates which, while profitable to the generating company, will permit a reduction in the cost of operating the dredgers. With water delivered to the top of the banks, and used through pipes and nozzles, this territory yields more gold at smaller cost per ounce.

Mr. Birkinbine calculates that three sluice-heads of water, supplied by the 750 cubic feet per minute furnished by the present plant, should each wash at least 500 cubic yards per day when in operation—i. e., move 1500 cubic yards per twenty-four hours; 26 cubic feet of water would, therefore, be required per cubic foot of material washed. But even if a more liberal supply of water must be pumped, this would permit the moving of the material to sluices at a cost below that required for dredging, and much below that which prevails at the active ground-sluicing operations.

The project is to use the irrigation ditches for conveying water to the gold diggings; but it may be found advantageous to attack some of the auriferous sands with water which need not be elevated as high as for the ditches, and greater service can thus be secured from a given river volume, applied as power to pump the water for washing. If, however, gold washing is carried on as an adjunct to an irrigation system as planned, there is opportunity for special saving in each department.

All of the gold in the Snake River district is finely comminuted, and the magnetic iron sand associated with it is also quite finely divided. It may be found practicable to withdraw the iron sands by magnetic separators, leaving a smaller volume to be subjected to amalgamation.

Man, Muscle and Coal.

The fact that the new steamer Deutschland develops power at the rate of 1 H. P. hour for each one and one-half pounds of coal consumed has been said to be the greatest development of marine boilers and engines. Static power producers have done even better than this. At the Edison power plant power has been developed at the rate of 1 H. P. hour for each pound of coal consumed. A few equations from this starting point would lead to:

One pound coal equals 1 H. P. hour.

Two thousand pounds coal equals 2000 H. P. hours.

Two thousand pounds coal equals 200 H. P. days of ten hours each.

One H. P. hour equals 14 M. P. hours.

Two thousand pounds of coal equals 2800 M. P. days of ten hours each.

Two thousand pounds coal equals 9 M. P. years of 311 days each.

Value of 2000 pounds coal, excluding transportation, $1 to $10, according to locality.

Annual production of coal in the United States, 240,000,000 net tons.

Potentiality in man power years of 240,000,000 tons of coal, 2,160,000,000 years.

Estimated number of male producers in the United States, 20,000,000.

Ratio between 20,000,000 male workers and the potentiality of 240,000,000 tons of coal, 1 to 108.

That is to say, 20,000,000 workers, without the aid of coal, would have to labor 108 years to develop a force equal to the potential energy of the present annual production of coal in the United States.

Transition to Electric Power.

With electrical distribution of water power only a small space is necessary for the few large wheels and dynamos that absorb the entire energy of the water. Millsites, instead of being confined to a little land along the banks of a river or canal, at once expand to include the territory within 5, 10 or a greater number of miles of the generating plant. This expansion of service area affects the number and the character of power users. The number of industries is limited only by the water available, and the capacity of each may be either great or small. Since millsites have come to include all the land within a long radius that is not required for other purposes, the opportunity to buy cheap power has only a slight influence on rents. Almost the entire saving in the cost of power is thus free to be divided between the water company and its patrons.

A distinct feature of electrically distributed water power is the advantages it offers to manufacturers of small and medium capacity. The consumer of 100 H. P. will probably have to pay somewhat more per unit than the consumer of 1000 H. P.; but the difference in rates will represent only a small fraction of that in cost which would result were a separate water-wheel installed for each case.

It is interesting to note that the results with electrically distributed water power are different from what some have expected. Electric energy, it was claimed, for example, would go great distances to the factories. As a fact, however, the factories have gone great distances to the electric power. Location and other advantages being equal, it is found more economical to move an industry once than to move a large amount of energy to it over a great distance daily. Increase of transmission voltages may reduce, but it can not eliminate the costs and losses of electric conductors. For very long transmissions the fixed capital in conductors, pole lines and the extra machinery necessary for the several transformations bears interest, per delivered unit of energy, that might well cover the entire charge for such unit near the generating plant. In the future, as at present, long-distance transmission of electric power must be the exception for special cases and transition, to within a few miles at most of cheap sources of energy, the rule for the great majority of industries served.—A. D. Adams in Cassier's Magazine for October.

Ore Thefts in Colorado.

Much of the high-grade ore that is stolen from the rich mines of Cripple Creek is marketed, it is asserted, in this city, says the Denver, Colo., Post. The managers of the mines that have suffered the most, according to a heavy stockholder in one of the companies affected, have evidence that certain ore buyers are getting rich from the stolen stuff, obtaining it at half and sometimes less than half its value.

The mining managers estimate that about 25% of the employes of the mines in Cripple Creek are engaged in systematically pilfering high-grade ore. They use many methods in getting the rich specimens out of the mines undetected. The scheme of compelling the men to change their garments before going down the shaft to work is regarded as the only solution of the problem, and, though it may inflict indignities on the honest miners, the managers think they will submit rather than draw suspicion upon themselves by refusing.

Men interested in the companies that have decided to compel men to not only submit to being searched, but to change their clothes after coming from the underground workings, say they do not know of any other remedy than the action taken by the companies.

They say: "The miners will no doubt protest, but think the fair-minded and honest ones will see the justice of the proceedings. You say that the men will object to being compelled to have two sets of clothing at the mines? Well, we believe an amicable agreement can be reached on that subject without difficulty. The mines should and, we believe, will be ready to furnish the miners with their working clothes. Few people have any idea of the extent of the theft of ore. The Elkton Company estimates that enough ore is stolen annually to rob us of one dividend —$75,000.

"Five of the Elkton employes were arrested recently for stealing ore. Twenty odd others who were known to be implicated in the thefts escaped. On the person of each miner arrested was found, on an average, $40 worth of ore. One of the men arrested has been a trusted employe of the Elkton for years, and his arrest was a great surprise to the management of the mine.

"Now, the question that arises is: whether the stockholders or the miners, who are paid their wages, are entitled to the profits of the mines?

"In this office a miner recently told us that he had seen a letter from a Cripple Creek miner, who was a foreman and had forty or fifty men under him, to a Denver assayer, asking him if he could handle, so that no questions would be asked, ore in car lots. The letter, our informant told us, offered the Denver man 50% of the value of the shipment for doing what he was asked."

That ore has and is being stolen in large quantities is admitted by the miners, who say that a few men working together have been heretofore able to make profits by their thefts. The taking of rich and small specimens from the mines is easily accomplished. The miner takes it in his dinner pail, the band of his hat, his shoes; but the most favored method has been by the use of belts, concealed under the shirt. These belts hold about ten pounds of ore, and only ore valued at $1 per pound or more is taken.

The wholesale stealing is also done in various ways. The ore sorters throw pieces of the richest stuff far out on the dumps and pick it up at night; but the favorite method is by putting large chunks of rich ore in the buckets that bring up the waste and barren rock. The buckets that contain valuable ore with the refuse are marked, and the men on top, seeing the mark, dump the bucket where the valuable rock may be easily picked up at night.

The greatest difficulty the ore stealers have to contend with is in disposing of the ore they have acquired. In some instances it is sold with the understanding that it is stolen; but the favorite scheme is to carry the ore to some friend who is operating a lease and have him send it out with his shipment. Of course, if there is no other way out of it the leaser pays to the owners of the property which he is operating a royalty on the stolen stuff and in this way covers up the tracks of his friend.

On the Use of Compressed Air.

The following is an abridgment of a paper on "The Practical and Economical Points in Using Compressed Air in Connection with Pneumatic Tools," read by J. L. Pilling of Chicago before the Franklin Institute:

It has been my privilege in connection with my avocation to visit about all the establishments where compressed air is used in the United States, and, without contradiction, I will say that, with few exceptions, I have not seen a properly constructed air plant in my travels.

The theoretical points of air compression have been understood from time immemorial, but the most essential, practical and economical points which are in demand to-day have not been touched upon, so far as I have been able to ascertain, which fact is proved by the observation cited in the first paragraph.

Compressed air will go as much below its normal temperature in expansion as it goes above it in compression; therefore, the larger the exhaust port and shorter the exhaust passage, the less liability of icing up the tool.

AIR COMPRESSORS.—Air compressors are as near perfect as we may expect to see them for years to come. The trouble lies not in compressor, but the manner in which the compressor is connected to the receiver, and taken therefrom. A receiver is not for an accumulation, as many think; only at the third stage. First, it is for condensing surface; second, to take care of the pulsation of the compressor; third, for an accumulation.

AN UPRIGHT RECEIVER.—By all means connect discharge pipe from compressor near the top of the receiver; take the outlet to the main line, about one foot from the bottom of the receiver. Have the receiver so placed that the outside atmosphere can circulate around it. Have a blow-off cock with a very short connection at the bottom. If conditions are such that a horizontal receiver must be used, connect discharge from compressor on top of receiver at one end; connect outlet to main line at the other extreme, but as low as possible, as long as it is above the fore and aft line of the receiver.

Why? On a clear day there are eight grains of water to a cubic foot of air, and foreign matter in suspension. Through the compression heat is generated. Heat will always rise. As long as air is above its normal condition in temperature the moisture and ingredients are in suspension. Moist air is a friction; moist steam is a lubricant. It will, therefore, be readily understood what a receiver is for, and why it should be connected up as I have already stated.

If, under these conditions, the air is still warm as it leaves the receiver, then the receiver is not large enough, or the compressor is too small, or both. (It is often well to place another receiver adjacent to where the most air is needed.) This argument will hold good even if an intercooler is used, as on a compound compressor. Precipitate the moisture in your receiver; that is what it is for. By so doing, you will have no trouble with your main line freezing, and you will obtain better results from your pneumatic tools, which are as finely constructed as any piece of mechanism on earth. Treat them as such; give them good, dry air; increase their efficiency by so doing, and lessen their repair bill.

Diamond Drill Work.

The British Columbia Minister of Mines proposes the exploration of the metalliferous country of the Kootenays by a government diamond drill. The cost of a plant to bore 1200 feet would be about $5000; the cost of working should be under $4 per foot. According to statistics from various parts of the United States, the cost of boring twelve holes from 200 to 800 feet in length each, totaling 5957 feet, is $14,839.62, or $2.49 per foot. This included labor, superintendence, bits, repairs, water, extras, freight, traveling and carbons. In northern Michigan, two holes totaling 634 feet, two 360, six 1350, two 611, six 1091, or eighteen holes totaling 5048 feet, cost $2.60 per foot in very hard ground. In Colorado 567 feet were bored at 44 cents per foot. The cost depends a good deal on the length of standpipe used. The smaller drills suggested would be worked either by hand or horse power.

New Developments in Jigging.

Some notice is being made of the concentrating works at Great Falls, Mont., where a new departure has been made from the old system of jigging. R. H. Richards, in his Cycle of the Plunger Jig, enumerated and discussed the law of free settling particles; the law of hindered settling particles; the law of acceleration, and the law of suction. According to Rittinger, the law of free settling particles (which he calls the law of equal settling particles), and the law of acceleration, are those which determine the separation of ore from its gangue. The Canadian Mining Review instances that, in accordance with this view, the best results should be obtained when the ore was sized, and, consequently, the mills of Germany and other European countries introduced a system of close sizing before jigging, which has been largely copied in America, but which gave rise to a great deal of criticism, and was finally abandoned by the most progressive mill men on this side of the Atlantic. An experimental investigation by Munroe of Columbia University, New York, established a third law of hindered settling particles, by showing that particles of ore falling en masse, as actually happens in the bed of material on the jig screen, are impeded in settling by falling through interstitial spaces, which is equivalent to their falling through narrow vertical channels of circular cross-section. As the interference increases with the size of the ore particle relatively to the diameter of the interstitial space through which it falls, it is evident that small particles of heavy ore, which would be equal settling with considerable larger particles of gangue, will enjoy a superior opportunity of being separated and saved. This conformed to recent experience in actual milling operations and explained the advantages which had been observed to follow the jigging of ore previously classified with hydraulic classifiers. The classifier accordingly superseded the trommel, and close sizing before jigging was relegated to the past. In other respects there was no material difference between European and American practice. A jig, consequently, while giving a remarkably clean product, could not be crowded without throwing large quantities of ore off with the tailings, and any increase of speed produced the same result. The speed was determined by velocity of rising current needed to lift the particles of gangue which would be equal settling with the smaller ore particles left in the classified product fed to the machine. Here was its limitation, closely and accurately confined, and the tendency of most mill men was to force through a larger tonnage than that for which the jig is calculated, with the inevitable result of loss of values.

It is to be noted that this limitation was fixed in accordance with the theory of particles falling in water after having reached the period of a uniform rate of fall, that is, after the resistance has increased with the increasing velocity of the particle until it counteracts the normal acceleration due to gravity. From this it follows that the jig stroke must be relatively long to allow the particles to reach this period of uniform rate of fall. According to the practice built up from this theory, the length of stroke for ore particles $\frac{1}{8}$ inch in diameter would be from 2 inches to $2\frac{1}{2}$ inches, repeated about eighty times a minute. A stroke as short as $\frac{1}{2}$ inch would not be used with particles larger than 1 m.m. (= $\frac{1}{25}$ inch), at a speed of not over 125 strokes per minute. Only with jigs for the finest sands, material such as is now concentrated on vanners and washers of the Wilfley type, were short strokes of from $\frac{1}{4}$ to $\frac{1}{8}$ inch, and speeds of from 200 to 350 strokes per minute, employed.

Attempts were often made to increase the speed, but the resultant losses were so great that the millmen hastened to retrieve what was looked upon as an error, and so the possibilities of doing good work on relatively large sizes of sands at very high speeds were not discovered. This is the peculiarity of the practice inaugurated by W. J. Evans at Great Falls, which, the Review asserts, has proven so successful that the system of high speeds and short strokes will be introduced into the 6000-ton concentrating plant being erected at Anaconda, Mont. At Great Falls ore crushed to pass a $1\frac{1}{2}$-inch mesh screen is jigged with 180 strokes per minute, $1\frac{1}{2}$ inches long, and other smaller sizes in proportion. In general the length of stroke should be approximately the same as the diameter of the maximum size of ore particles fed, making due compensation for the relatively greater resistance to falling in water on the part of very small sizes of grains. The result of this is to take advantage of the acceleration before the period of uniform velocity of fall has been reached, and thus to assist gravity many times a minute. Mr. Evans would dissent from this way of stating the matter, his view being that jigging depends less on gravity than on frequent assisting of gravity by quickly applied suction at the moment of reversal of motion. This is a widely different thing from the so-called law of suction proposed by Mr. Richards. He says: "The law of suction seems to be that jigging is greatly hindered by strong suction where the two minerals are nearly of the same size, the quickest and best work being then done with no suction; but when the two minerals differ much in size of particles, the quartz being the larger, strong suction is not only a great advantage, but may be necessary to get any separation at all." Directly opposed to this, it would seem that the practice adopted by Mr. Evans would logically lead to a return to the continental system of close sizing before jigging, since the larger grains would yield more readily to the forces operative at such high speeds. The Review continues:

Another feature of the new system adopted at Great Falls is an increase in the depth of the jig bed, with the use of screens of larger mesh. That this has been necessitated by the change to higher speeds and shorter strokes indicates that Munroe's law of hindered settling particles plays here a role which, in some respects, must be different from that which it performs with classified ores under the prevailing American practice. There are features here which are manifestly novel and require further investigation. That greatly increased capacity per unit of screen area is obtained by Mr. Evans' system, without causing losses of valuable mineral, is indubitable, and thus the value of the jig is still further enhanced. In order to obtain the best results with high piston speed, it is important to secure a vertical motion with the piston held rigidly in a horizontal position. This end has been secured in a jig designed by Mr. Evans, having double piston rods working through boxes fixed in the cover of the piston compartment.

Mining in the Philippines.

At Washington, D. C., are received official Government reports showing that the mining bureau is an interesting department in the administration of Philippine affairs. The mining bureau is in charge of C. H. Burritt, who went into the service as a private soldier. Lieut. Burritt has translated and compiled the Spanish mining laws which have been in force since 1846, and has prepared a new system of laws modeled upon those of the United States, but adapted to the conditions existing in the archipelago, which will be considered by the authorities and put in effect when conditions warrant.

Concerning the mineral resources of the Philippines, Lieut. Burritt says:

There are two belts of coal extending through the whole archipelago on an angle of 60°, northeast and southwest. The greatest deposits of coal are in the islands of Cebu and Negros, the finest beds in the small island of Bataan. This coal is all, so far as is definitely known, of a Tertiary age and might be better characterized as highly carbonized lignite. The first discovery of coal was made in 1827, on the island of Cebu, and since that time lignitic beds have been found on the island in great quantities not 12 miles from the capital. These mines have been worked, on and off, at the different stages, but it was never realized what a steady output was. Here the circumstances exist in that the seams and leads are badly broken. Uling-Uling was and is now the principal coal mine in Cebu. The coal of these islands is better than Australian and Shanghai coal and equals that of North Borneo.

Copper is next in importance. It is found in all parts of the island, especially abundant in the provinces of Lepanto, Benquet and Camarines.

The best known copper region lies around Mt. Data, which is given out as being 2500 meters in height. The ranges of which Data form one peak trend due north to Cape Lacay and form the boundary for all the provinces infringing on it. Data lies in the province of Lepanto. In this range copper ore has been found from time immemorial. Mean assays show over 16% copper, mainly as tetrahedrite and allied ore. The gangue is quartz. The rock in the country is described as a large quartzite lens imbedded in a great mass of trachyte. Attempts have been made to mine copper as well as coal, and with the same results. This failure is not because of the quantity or quality of copper, but because of a lack of steady labor and proper means of transportation.

Gold is found in every part of the archipelago—Luzon and Mindanao especially. Gold mining during the Spanish regime was a failure, because of the tax and unfair dealing with hired help. Placer mining has never been seriously worked, although where gold has been discovered it has always yielded well.

Of the other minerals of the islands, there are silver, lead, iron and quicksilver. The most important deposit of argentiferous galena is at Tarrijas, on the small island of Marinduque. A metric ton, or 1000 kilograms, contains 96 grams of silver, 6 grams of gold and 565.5 kilograms of lead. Iron is found in abundance in Luzon, Caraballo, Cebu, Panay and other islands. Quicksilver is rumored to have been found in the islands of Panay and Leytle, but no verification is placed on these rumors.

Lack of transportation facilities and of intelligent labor are the chief obstacles to the development of the mineral resources of the Philippines. In relation to this, Lieut. Burritt says: "In all the island of Luzon there is not a road that would transport properly a load of goods 200 miles. This fact has been, and will be, the adversary of civilization, and until good roads are built to intersect every part of the islands civilization will be at a standstill, and the insurrection will go merrily on. Luzon needs roads to open up its vast resources; roads that will bear all travel and still be good; not the roads of to-day, which are an intermingled mass of mud after the first rain. How can coal mines be operated without roads? How can copper and ore mines be operated without roads? That they can not be operated with any success is proven by the many skeleton mines that intersect the mountains of northern Luzon and elsewhere and show the bitter experience of failure. Roads and bridges of the highest standard are needed. No roads, no peace; no roads, no mines. Labor is the obstacle that stands in the way of success in mining in this archipelago. The native labor is transient and can not be depended upon. They will work until they have capital enough to lay off three or four months, and love nor money could not get them to do a stroke of work until they are broke. That mines when once started should be kept going is vital. Let a mine close for two months and its future is a failure. The importance of having labor which can be depended upon is apparent. Unless the Philippinos get down to business like they should, they will be supplanted in the labor field by Chinese. This is inevitable."

Removing Stumps With Dynamite.

Stumps can be removed by using dynamite, which not only throws out the stump, but tears it in pieces small enough to handle, the earth is cleaned off, and the pieces may be cut up and used as firewood. In placing the charge or charges under the stump the operator must study the nature of the soil, size and direction of the roots, and so place the charge that it may present its explosive force against the center of resistance. This can be done by boring under the stump into the soil somewhat deeper than past the center, so that the charge may be under the center of the stump. In all cases put in enough dynamite to do the work thoroughly. Where several holes are loaded, the charges all coming close together under the stump, one primer of a single cartridge will explode all the others. A hardwood tamping rod must always be used to push the cartridges to the bottom of the hole and to ram the hole full of dirt. It will also be found necessary to use more dynamite with pine stumps than with hardwood stumps, and in light than in heavy soils. From two to three pounds of dynamite are usually required to remove a stump. The main object is to use rather more than too little dynamite, and to concentrate the charge as nearly as possible at the point of greatest resistance. The tools required in stump blasting are a wood auger, a dirt auger and a tamping rod. The augers should be from $\frac{1}{2}$ to $2\frac{3}{4}$ inches in diameter, with a shank about 5 feet long.

The best time to do the work is midsummer, when the ground is dry and hard. Place two sticks of dynamite as close under the center of the stump as possible and get the load close to or against the wood, using a $1\frac{1}{2}$-inch auger with a shank 4 or 5 feet long.

For placing the charge under the stumps, use two 2-inch augers, each equipped with a 5-foot shank, one to bore into the dirt and the other to bore into the stump root. The charge should be placed directly under the middle of the stump, and it will take from one-half to three cartridges, according to the stump. The greatest care should be exercised in handling the caps. The fuse ordinarily used will burn 1 foot per minute and should not be cut less than 2 feet long. That will enable the operator to get twenty rods away. The 40% dynamite is safer than the common black powder, as sparks will not ignite it. When a stump is not entirely blown out, pieces of others can be piled around it and it will burn out readily.

Cement for Electric Wire Connections.

To make good electrical connections between the adjoining ends of wires used as electrical conductors, especially in electric lighting and power circuits, it is customary to first twist or otherwise bind the ends of the wires together in order to make a joint having the required mechanical strength, and then apply solder to this joint for the purpose of making a continuous metallic circuit of low resistance.

An improvement in this line is a metallic cement, which may be applied to the joint by hand after the wires are twisted or secured together without the use of heat, and for all practical purposes takes the place of solder. The cement consists of an amalgam, with which is mixed a binding material, the mass having about the consistency of putty. When put up in stick form the cement will not harden, except at the surface, where a slight crust is formed, and when the mass is worked between the fingers it becomes soft and plastic, so that it may readily be applied to the wires. In making a joint the wires are twisted or secured together, and the joint formed is coated with cement.

The cement consists of the following ingredients in the proportions specified: Zinc, four parts; tin, two parts; copper, two parts; cadmium, two parts; bismuth, four parts; lead, two parts; antimony, one part; mercury, eight parts. The solid metals are granulated and melted together, after which the mercury is added, the mass being stirred at the same time. When cool, the mass is pulverized in a mortar, and a binding material, consisting of liquid glucose and silicate of soda, in sufficient quantity to bind the mass together and give it the consistency of putty, is added to the mass. The cement thus formed will not harden when in bulk, and may easily be worked between the fingers; but when spread out on a joint it not only adheres to the latter, but hardens in from twelve to twenty-four hours. The cement may be applied to the wires without any previous application of acid, and by amalgamating with the conductors it forms as perfect an electrical union as could be formed by the application of solder. The application of the cement prevents oxidation of the wires. After the joints are thus made they are covered with an insulating tape.—American Manufacturer.

MINING SUMMARY.

ALASKA.

(Special Correspondence).—During the past two months there have been several new creeks discovered and some bench developments that are extremely rich. I examined a bench claim near the head of Anvil creek which paid about $1000 per day to the rocker, and the one adjoining, which was sold to C. D. Lane for $75,000, before he got possession two men with one rocker in thirty-five days took out $71,500; but, in my opinion, they got the cream of it, for at a recent visit I made it did not look near so well. There are several drawbacks to this country; the worst of all is the pencil-and-hatchet-men, who have staked the whole country from the highest mountain to the lowest valley, and never do any work; the next, the endless litigation; almost every claim of any value in the country is to-day in the hands of a receiver. Any one can put the best claim in the country in the hands of a receiver whether he has ever seen the claim or not; all he has to do is to put up a willow stake as big as your finger and get some irresponsible fellow to swear that he had this stake last year, or that the other fellow's location was not properly made.

We are just now in the midst of the greatest storm of the season. The damage to property on lower Main street and along the beach will reach close on to $1,000,000 in the last forty-eight hours, and many hundreds are left homeless and penniless. The sight in the surf is grand, yet frightful, to see a great mass of lumber and property of every description hurled round and round at the mouth of Snake river and dashed back and forth by the surf until it is ground into kindling wood. MINER.

Nome, Sept. 13.

In August, Judge Noyes refused to remove Alexander McKenzie from the position of receiver of the claims of the Pioneer M. Co. at Nome, and the Court of Appeals reverses Judge Noyes' decision and orders him to give a correct account of all the gold extracted and to hand it over to the Pioneer M. Co. immediately. The decision has given much satisfaction.

ARIZONA.

COCHISE COUNTY.

The Copper Queen Co. has contributed $3000 to the University of Arizona to aid in the construction of a machinery hall for the industrial and mechanical department of the institution.

MOJAVE COUNTY.

Manager Ware of the White Hills M. Co., at Kingman, says that the silver-gold ore below the 600-foot level of the Occident mine holds out. The shaft will be sunk to the 1000-foot level.

E. T. Loy, of Chloride, who negotiated the sale of the Minnesota-Connor mines, is ill in Philadelphia. The amount of the first payment is said to have been $25,000 and the sum for which complete title passes $300,000. Work on the newly acquired mines has begun by W. Miller.

PINAL COUNTY.

In the Golden Rule mine, near Mammoth, a 4-foot ledge contains sulphide and carbonate of copper 8%, eighty ounces silver and $12 gold. The company is sinking three shafts. J. D. Burgess is manager.

The reorganized Pinal Con. M. Co. propose resumption of work on the mines of the company, 16 miles from Florence.

YAVAPAI COUNTY.

The Mulholland property, near the Trilby, in the vicinity of Prescott, is sold for $20,000 cash. It is a developed copper property and is bought by W. Quigley of Ohio.

The stamp mill of the Montgomery M. Co. at Lynx creek, 12 miles from Prescott, was completely destroyed by fire on the 28th ult.; loss, $10,000.

YUMA COUNTY.

The Arizona Giant Copper Co., represented by N. G. Douglas of Los Angeles, have bought for $10,000 three copper claims—Self-Defense, Gladiator and Hercules—8 miles southeast of Ehrenberg.

The Mariquita gold mine, Plomosa district, is reported sold to D. A. Stokes of Los Angeles for $67,000. He will erect a reduction plant and work the mine.

CALIFORNIA.

AMADOR COUNTY.

Ledger: The East Central Eureka M. Co. has brought suit against the Central Eureka M. Co. for $120,000. The hearing has been set for Oct. 6. The plaintiff alleges that defendant is wrongfully and unlawfully extracting ore from plaintiff's ground.

Record: Ten stamps of the South Spring Hill are running on ore from their mine and ten stamps on ore from the Lincoln mine. Supt. Tregloan is very confident of once more placing the South Spring Hill mine on a dividend-paying basis.——At the Keystone, Supt. Pritchard, large bodies of low-grade ore have been developed and are being put through the 40-stamp mill.——The shaft at the Bunker Hill mine has been unwatered 40 feet below the 600-foot level and retimbered the entire distance ——Supt. Purrington is developing the Gover–Fremont property.——Twenty-five stamps of the new Oneida mill at the Oneida mine are in operation, temporarily by water power, as the Standard Electric Co. are not yet ready to furnish electric power. The ore comes from the 1900 and 2000-foot levels.——The new steam hoist built by Knight & Co. at the South Eureka mine is completed and works smoothly.

BUTTE COUNTY.

J. Clark of Yankee Hill has a large deposit of marble in the Big Bend country.

CALAVERAS COUNTY.

Work on the old Central Hill gravel mine has stopped; no water. Pure sulphur forms on the banks in fungus-shaped exudations.

Work at the Lloyd mine, Central Hill, is being steadily prosecuted; the shaft is down 160 feet.

At San Andreas the case of Laura Daveggio vs. the Utica G. M. Co., to recover $25,000 for damages to the health of the plaintiff by reason of smoke and fumes from the Utica chlorination works at Angels Camp, ended in a verdict for the defendant.

At Jenny Lind the Lost Log group is idle, except the Brown addition, where a tunnel is being run to strike the vein at the shaft by Ira Phelps.

The Sheep Ranch G. M. Co. will run their works at Sheep Ranch by water power; 8700 feet ditch and 11,439 feet pipe will be needed, 20, 18 and 16 inches.

The Lightner mine at Angels Camp is run by electric power furnished by the Standard Electric Co.

At West Point the hoisting works of the Lockwood were burned to the ground last week. Up to Sept. 10th the mine was worked by the Grasshopper M. Co. The mine was to have resumed.

EL DORADO COUNTY.

W. I. Smart will superintend the work at the Shaw mine, near El Dorado.

The Barbara mine has been unwatered for examination.

J. E. Russell, in the Superior Court, prays for possession of the Spring Canyon placer mine and $5000 damages.

INYO COUNTY.

Independent: The Ballarat M. Co. will build a 10-stamp mill at their mine, 4 miles south of Ballarat.——Supt. Harrison of the Ratcliffe Con. is looking for miners and needs about fifteen more men.——The miners working at the Cooper mine, at Stone corral, are getting $4 per day.——The Tuber Canyon Co. will take out their roller mill, replacing it with a new 10-stamp mill.—— Supt. Stebbins of the World Beater mine has interested Los Angeles men in the mine and is running a tunnel from the mill level to tap the ore body 300 feet lower than the present workings.——Supt. Pickett of the Cole & Garcia mine will develop the property with twenty men.

KERN COUNTY.

The Yellow Aster M. Co. is locally credited with intention to build a 100-stamp mill in addition to its present 30-stamp mill.

The present freight rate on oil from Bakersfield to San Francisco is 42 cents per barrel. The switch charges from the main track on the Southern Pacific Railroad system into the Kern river oil fields is $5 per car, or about 3½ cents a barrel, a total present cost of 45½ cents per barrel for shipping the oil from the wells to San Francisco. The present price of oil in the Kern river district is 85 cents to $1 per barrel at the wells. There have been contracts made extending over a period of five years at $1 per barrel delivered at the wells.

A Bakersfield special to the Herald says, while forging at the mouth of No. 5 Sterling, Kern River district, a gas blowout occurred, and quick as a flash the rig was wrapped in flames. The crew just barely escaped being roasted to death. The rig was consumed. The gas flamed 20 feet above eleven five-eighths casing. The hole is down 700 feet. Hereafter there will be no more forging at Sterling wells. It is a general practice, however, in the district.

LASSEN COUNTY.

The Daisy Dean M. Co., operating at Hayden Hill, has incorporated; J. H. Roberts, J. G. Jilson, C. L. Crane, L. A. McIntosh. L. A. McIntosh is Supt. Midas mine, Harrison Gulch, Shasta county.

LOS ANGELES COUNTY.

The Desert M. Co. has incorporated in Los Angeles; A. C. Harper, A. Solano, R. H. Smith, M. Allen, R. N. Walton; capital stock, $250,000; subscribed, $500.

MADERA COUNTY.

The Boulder M. Co. is incorporated; J. R. Ryan, W. F. Waddell, W. C. Tighe, J. W. and J. L. Ragsdale, J. McKee, Madera, and A. C. Francis, San Jose; capital stock, $300,000; subscribed, $250,000.

MARIPOSA COUNTY.

A pump station is being cut at the lower level in the Mariposa mine, and as soon as the pump is installed the work of sinking to the 800-foot level will commence. Work on the west drift at the second level has been stopped at 500 feet to push the drifts at the 600-foot level, each of which is in about 200 feet. Men are getting out rock for the foundations for the mill buildings.

NEVADA COUNTY.

The Union reports a strike at the Reddik mine in the Delaware channel.

The Red Hill mine is to be opened and the mill rebuilt.

PLACER COUNTY.

The Dewey Con. M. Co., composed of Stewart, Doolittle, Sprague, et al., is building retaining works in Indian canyon, near Iowa Hill, to mine next winter by the hydraulic process.

Supt. Jordan has the Blue Lead mine in good condition. A bedrock cut is extended up the Dutch Flat canyon. He thinks he has found the old deep blue lead channel.

The Pioneer G. M. Co., through its secretary, C. H. Howard, states that at the meeting at Helena, Mont., the Pioneer-Lynn M. Co. was organized under the laws of Colorado, with the same number of shares as the old company, of the par value of $5 each, for the purpose of acquiring the California properties, and asks surrender of certificates of stock, before Oct. 22, and at the same time pay 20 cents for each share surrendered; stockholders so doing will thereupon receive a receipt for a similar number of shares of the new company, to be delivered as soon as certificates can be prepared. It was at first proposed to require a payment of 50 cents a share upon the exchange of stock, but the sum was reduced to 20 cents on the recommendation of the advisory committee appointed by the stockholders. In case all of the stockholders should not exchange their stock, those making the exchange will be given the right to take the remaining stock of the new company on paying therefor 25 cents a share.

PLUMAS COUNTY.

In the strike of rich gravel in the back channel at Rich Bar slugs worth $40 have been taken out.

SAN DIEGO COUNTY.

The Monarch Co. is reported to have struck an increased quantity of oil in the well at Morena.

SANTA BARBARA COUNTY.

At the Carreaga rancho, in the north of the county, the Western Union Oil Co. has a well at 1150 feet; daily production, seventeen barrels.

SHASTA COUNTY.

The Mount Shasta mine and the claims comprising the group were sold at commissioner's sale at Redding last week to satisfy a judgment held by R. R. Vair against the Mount Shasta Gold Mines Corporation and others for $5926.11, with costs and interest, to W. Harfst of San Francisco for $6098.57.

SIERRA COUNTY.

J. H. Roberts is building a railroad from Boca, Nevada Co., to Roberts.

SISKIYOU COUNTY.

(Special Correspondence).—The Salmon River M. Co. at Sawyer's Bar have shut off their giants working there and are extending their flume 1 mile farther down the Salmon river to work a rich bunch of gravel at that point. The company's flume is already 5 miles long and the extension will make it one of the longest flumes in the State. There are other undeveloped gravel claims along the Salmon river yet and capital would be recompensed by an investigation.

The Mountain Laurel mine, one of the Ball group, turned out more rich free gold ore this week.

Rollin, Sept. 30.

The Greenhorn No. 2 is pumped out.

Baker & Jewett are shipping ore to the Tyler mill on Klamath river.

The Salmon River M. Co., near Sawyer's Bar, will extend their flume to the Mayers claim.

The Schroeder mine on Deadwood will resume operations.

SONOMA COUNTY.

At Cinnabar mining district, Pine Flat, on the 1st inst., L. W. Pittman was elected recorder.

TRINITY COUNTY.

The "inverted siphon" of the La Grange Hydraulic G. M. Co., forming a part of the main water system, conveys the water of Stuart's Fork and Rush creek to its mines on Oregon Gulch mountain and Morris hill. The pipe is 30 inches in diameter, made of steel, and was tarred and tested before being put in place. It is anchored at all angles and buried for a great part of its length in a trench 3 feet in depth and 3 feet in width. There are eight 3-inch valves on the inlet side and five manholes at points about 1000 feet apart. Expansion joints are provided at each end of the pipe just below the inlet and outlet pieces. The inlet piece is bell-shaped, 4 inches diameter at the upper end and tapers gradually to 30 inches. It receives the water from the bottom of the head box and is curved at the smaller end to come into line with the pipe on the hillside. The outlet piece is in the shape of a bonnet, 4 feet in diameter at the upper end, and discharges the water into the vertical end of the outlet box. At the lowest point of the "syphon" the pipe has a 4-inch gate valve, which serves as a blow-off cock when necessary to at any time empty the pipe, opened and closed by bevel gearing. The pipe crosses Stuart's Fork on a wooden truss bridge 12 feet wide, 138 feet long. The main water system consists of 23.85 miles of flume and ditch, three inverted "syphons," aggregating 8754 feet in length, and eight tunnels, aggregating 11,134 feet, making a total length of 27.61 miles of mining ditch.

Journal: J. McClees of Minersville was in Lewiston recently with seventy-six ounces of gold which he had taken out of his mine at Ridgeville, near Minersville, in five days' work last week. This makes about $2500 that he has taken out the past month.——J. McMurry has sold his mining interests to his partner, W. I. Hupp, Sr.

TUOLUMNE COUNTY.

The Comstock, in the east belt, is being operated by the Golden West M. & M. Co. of San Francisco. The tunnel is now in 900 feet; a double-compartment shaft is to be sunk.

The Gagnere mine, at Tuttletown, is being operated by the Tricolor Con. M. Co.

At the Santa Ysabel Supt. Gorrie has unwatered the mine.

A shoot of ore is reported on the seventh level in the Confidence mine.

The Dreisam shaft has reached a depth of 400 feet.

The Green Con. Co., near Sugar Pine, have erected a new hoist at No. 2 shaft on the Green.

Near Big Oak Flat the Four Oaks mine has been shut down. Pumping is still being prosecuted.

The Mack Con. Co. have suspended all underground operations. The prospecting mill is running.

YUBA COUNTY.

The large flume of the Yuba Electric Power Co. near Dobbins Ranch is completed. It extends 10 miles, the total cost about $300,000.

COLORADO.

BOULDER COUNTY.

Three miles north of Caribou, the Silver Lake M. & M. Co., which bought the Silver Lake mine last June, has sulphide ore, bearing gold, silver, copper and lead, $50 per ton, at 100 feet, and intends sinking a shaft 500 feet deep on the vein, where there is 4 feet of concentrating ore, besides 2 feet of smelting ore.

Wolframite or tungsten, reported in the Nederland district, analyzed 70% tungstic acid.

The old Blue Bird has a vein of silver ore which runs 1800 ounces in silver. Twenty men are employed.

CHAFFEE COUNTY.

C. E. Barrick, manager Magenta mine,

near Granite, says the Magenta shaft will be continued to a depth of 600 feet without stopping to drift or crosscut. Forty thousand dollars will be expended in development.

C. Haines, manager Cameron M., L. & T. Co., Whitehorn, has men at work doing assessments and driving tunnels to cut the veins on Cameron mountain.

CLEAR CREEK COUNTY.

At Empire operations on the old Maud S. mine, on Douglas mountain, gave returns of $140 per ton for smelting ore. An aerial tramway has been constructed from the mine to the tracks of the Colorado & Southern Railroad, and power drills will be used for development.

Near Georgetown the Pelican two weeks' ore production gave mill run returns of $5600. There is still some profit in silver mining.

FREMONT COUNTY.

At Florence the Colorado Fuel & Iron Co. has closed down the Fair Gulch coal mine. It employed about 100 men. The mine is closed indefinitely.

GILPIN COUNTY.

Jno. Richards last week shipped a lot of bricks picked up out of the gulch to the State Ore Sampling Works, and for the lot of 550 pounds he received a check for $340.40, being a value of nearly seventy ounces gold per ton. These bricks formerly occupied a place as the lining of the assay furnace in Hill's smelter at Black Hawk and were impregnated with gold, which had been carried off with the metallic copper.

Register-Call: At Perigo and Gilpin 125 miners are at work. The smelting ore and mill tailings from these sections all find their way into Black Hawk.——At the Perigo property about fifty men are at work. The Perigo mill's thirty rapid-drop stamps crush eighty tons ore every twenty-four hours.——The Daisy mill in Gamble gulch is running ten stamps on Gold Dirt ore. The Gold Dirt employs twenty-five men.——Fifteen stamps at the Petersen mill treat about twenty tons of ore from the Gold Dirt mine every twenty-four hours.——At Yankee W. R. Miller has an assay of 960 ounces silver from his Boer lode, or $576 per ton.

GRAND COUNTY.

H. H. Daniels has sold a tract of placer land at the head of Willow creek and Gold Run to to the Louraine G. M. & M. Co. The company will build a ditch and do other work preparatory to the commencement of active washing.

HINSDALE COUNTY.

Near Lake City the old Elmendorf mill, last used by the Hartwig M. & M. Co., has been bought by the Moro Co. and is to be put in order. A wire tramway 4000 feet long is to be built to carry the ore from the mine to the mill.

The Golden Fleece Co. is building thirty canvas tables to run the tailings over.

At Lake City work is resumed on the Golden Fleece tunnel, now in 1700 feet; when the upraise is started to the upper workings the tunnel will be 2800 feet long.

LAKE COUNTY.

At Leadville in the Bon Air shaft ore is being sacked which runs $300 per ton in silver and lead.

The shipments from the home properties are nearly 250 tons per day.

The Herald-Democrat says difficulty exists in obtaining supplies of machinery for mining development.

Among other improvements in mining, milling and smelter practice the Leadville Carbonate Chronicle notes an expenditure of $100,000 in the Arkansas valley smelter by Manager Weddle designed to accomplish a saving. There was a waste in slag and a loss in smelting caused by the fumes and gases from the blast furnaces, which all contain values in the shape of gold, silver and lead, in a measure saved by the use of large brick chambers, through which the smoke and gases pass, the heavier particles settling to the floor. With the best flue chambers designed, however, only a portion of the values have been saved; the system in operation Nov. 1st at the Arkansas valley plant is intended to save practically everything worth saving in the smoke from the furnaces. There are two sections in the system of flue chambers. One extends beyond the plant for about 1000 feet, arched shape, a cross section of which measures 256 square feet; material used is iron and cement, frame work of channel iron with metal lath wired to the beams, covered with a coating of cement, inside and out, an air space of about 2 inches being left between the two coats, air tight and impervious to moisture. The interior of this chamber contains a few feet from the bottom a V-shaped trough, where the heavier particles settle. Cars will be run below this trough and the flue dust collected every day. The second section consists of a different shaped chamber, but of the same material, iron and cement, known as the beehive. The system consists of three parallel chambers, nearly 1000 feet each in length, but each one connected. The arched openings, however, can be closed by iron dampers, permitting one parallel line to be entered and cleaned out, while the smoke winds its way through the other two, until it enters the stack. As the heavier particles in the smoke will settle in section No. 1, the deposition in the second section will be slower; it will not be necessary to make a cleanup more than three times a year. To assist in supplying a draught the same style of chambers are being constructed from the Ropp and hand roasters. The circular stack is 185 feet high, inside diameter 18 feet.

SAGUACHE COUNTY.

In the Eagle mine, near Bonanza, is a stringer of rhodochmite ore, rich in native wire silver.

SUMMIT COUNTY.

There is a Breckenridge project to operate the flat contact veins of Yuba Dam Flats by a smelting company. The bodies of iron sulphide ore are from 2 to 6 feet in thickness.

TELLER COUNTY.

The gold output for September is figured at $1,946,000, as follows:

	Tons.	Value.	Total.
Colorado City.....	8,500	$36	$ 306,000
National..........	4,000	30	120,000
Metallic...........	6,000	25	150,000
El Paso...........	3,000	25	75,000
Economic.........	6,000	30	180,000
Arequa............	2,500	20	50,000
Smelting ore......	15,000	70	1,050,000
Miscellaneous.....	....	..	15,000
Total value....................			$1,946,000

IDAHO.

CUSTER COUNTY.

The Challis Messenger says the Stanley Basin dredger is now taking out daily $600, handling about 2000 yards gravel.

At Mullan the new Morning compressor is building, T. Cox, manager.

IDAHO COUNTY.

(Special Correspondence).—Placer season here has been a good one, despite the light snowfall last winter. An early spring, with cool weather and June rains, conserving and helping water supply. We used—had no more to use—about three-quarters as many miners' inches as last season, and broke about seven-eighths as much ground with good values and satisfactory summary.

Newsome.

LEMHI COUNTY.

The Silver Star M. Co., A. A. McMillan, M. J. Lowney, C. S. Jackman, capital stock $10,000, assessable, and the Tri-Metallic M. & M. Co., 2,000,000 shares, 1 cent each, have incorporated in Butte to operate in Lemhi county.

OWYHEE COUNTY.

Near Silver City the Cumberland mill is in operation.

Free gold in galena is reported at South Mountain. R. C. Williams, Supt. South M. Co., says he has twenty-five men employed on development work.

The Avalanche says about Jan. 1st the Trade Dollar Co. will install locomotives in its working tunnels operated by compressed air. The air compressors, mills, hoists, fans and all machinery will be operated by electric motors.

The Sinker tunnel, near De Lamar, is now in over 2000 feet.

SHOSHONE COUNTY.

At Oro Fino the Eureka P. P. M. Co. has applied for patents on its properties at Reed's creek. It has a mile of flume completed. This is the first application for a patent in the Pierce district.

MONTANA.

Estimates of Montana's copper output this year make it in the neighborhood of 325,000,000 pounds, worth $42,250,000.

BROADWATER COUNTY.

R. A. Bell, in the East Pacific mine, near Winston, has ore which runs $3000 per ton gold in No. 4 tunnel, 900 feet from the surface.

CASCADE COUNTY.

The Diamond R. concentrator at Neihart is to be enlarged to a capacity of 300 tons daily. It is the intention to build the mill by day labor. W. W. Masters is superintending. The plan of transferring ore from the Broadwater to the mill is to erect a wire tram above tunnel No. 8 at the Broad and run by air line to the concentrator; capacity fifty tons per hour; raised upon pillars 30 to 110 feet above the ground; 3400 feet in length; total fall, 500 feet.

MADISON COUNTY.

At Red Bluff Manager Sherman at the Red Chief mine has the grading finished for a thirty-five-ton concentrator.

G. D. B. Turner at the Red Bluff mine has new head gear and plans completed for a seventy-five-ton concentrating plant.

The electric power company at the Madison canyon, 6 miles from Norris, has forty-six men at work on a flume, 10 by 14 feet wide, 2500 feet long.

NEVADA.

ELKO COUNTY.

The Dexter and Tuscarora Cos. at Tuscarora are to consolidate.

ESMERALDA COUNTY.

H. M. Yerrington is arranging to ship 200,000 tons borax to Japan.

EUREKA COUNTY.

O. J. Smith is appointed receiver for the Whalen Con. C. M. Co., at Alpha.

HUMBOLDT COUNTY.

Near Golconda, at the Adelaide mine, owned by the Glasgow & Western Exploration Co., experts are sampling to determine to what extent the smelter shall be enlarged.

LINCOLN COUNTY.

At Searchlight the McCurdy mine, owned by the Quartette Co., at a depth of 250 feet has a ledge 17 feet wide.

C. Gracey, at El Dorado canyon, will add the five stamps recently purchased from the White Hills Co. to the mill, making thirty stamps for crushing ore for the new cyanide plant; 100 tons of ore daily will be sent to the mill.

STOREY COUNTY.

Last Sunday the electric current was turned on at the Floriston power plant to test the lines connecting with the sub-station at the C. & C. shaft and found satisfactory. Superintendent Ryan received the first message from Floriston over the double line of telephone wires connected with the power plant pole line. A test run of the Gould & Curry mill will be made, the machinery adjusted to the power, and it will begin crushing on the 15th. The delivery of electric power on the Comstock lode will be appropriately celebrated this month.

WHITE PINE COUNTY.

The Ely G. M. Co. expects to have its new mill and ore-leaching plant in working order December 1st.

At Ely the Robust mine shaft is down 120 feet. When the 130-foot level is reached, a station will be cut and connection made with the surface above the mill by a tunnel, through which the ore will be handled.

NEW MEXICO.

BERNALLILO COUNTY.

At Bland, in Cochiti district, W. C. Wynkoop will superintend the erection of a 100-ton cyanide mill to take the place of that recently burned down.

The Star Co. will build a tramway and pipe line.

GRANT COUNTY.

The Atlantic mine at Pinos Altos, owned and operated by the Treasury G. M. Co., under the management of W. Brand, is being worked on the seventh level. The ore runs $17 in gold, $8 silver and $6 copper.

Dimmick Bros. have a thirty-ton smelter and refiner on their property at Pinos Altos, and are treating the ore mined since June 1st.

The Rathburn, Maze and Cothron groups at Pinos Altos have been leased and bonded to the Golden Giant M. Co. corporation. This company is now arranging to increase the capacity of its stamp mill to 125 tons daily.

The Gold Coin Prospecting & Development Co., which set out from Colorado Springs last March for a trip of three years, is operating in the Malone mining district, in the southwestern part of the county. There are eight men. It is the plan whenever a prospect is found which promises well to do sufficient development work to demonstrate its work, and then turn it over to a sub-company for future operations.

OREGON.

BAKER COUNTY.

Baker City reports a strike at the Baisley-Elkhorn mine between the 100 and 200-foot levels of a 3-foot vein of high-grade ore.

JOSEPHINE COUNTY.

F. H. Osgood has purchased the Josephine mine on Rogue river and has men fitting it for operation.

Kelly & Shipley have sold their group of copper claims to T. M. Draper of San Francisco.

UTAH.

BEAVER COUNTY.

It is figured that the Horn Silver Co.'s mines at Frisco have exposed in the property and in the tailings dumps 500,000 tons of ore that will afford an average of 30% zinc.

JUAB COUNTY.

(Special Correspondence).—The Eureka Hill combination mill is operating on 175 to 200 tons of very hard ore per day. The mill contains 100 stamps, 1000 pounds each, 100 drops per minute; fifty Frue vanners, thirty-two amalgamating pans, sixteen settlers, a number of clean-up pans, retort and smelting furnaces. At present sixty stamps are doing the work. In former years plates were in use below the batteries, but that was at a time when the gold in the ore was a more important factor than now. The ores carry oxides, sulphides and chlorides; the values, named in the order of their importance, are silver, lead, gold and copper. The silver which is found with the galena and lead carbonates is saved in the concentrates; that in chloride form being saved in the amalgamating pans. In the pans a small percentage of gold is obtained, but the most of it is saved in the concentrates.

The ore passes through Gates' crushers before going to the stamps. The product of each battery of five stamps passes to three vanners set in tandem—each vanner getting a third. Formerly sizers were used to divide the material, but they were discarded, first, because it is claimed they did not do their work perfectly on these ores; and second, because it seemed a better saving was made to permit the fine and coarse material to pass over the belts together. Hence, the product is the same from all the vanners. The bulk of the ores carry a high percentage of silica, which is pretty thoroughly eliminated from the concentrates by the vanners, though some of the fine carbonates are lost in the siliceous tailings. Now these vanner tailings are collected in a series of settling boxes—the water and slimes overflowing from one into another, the first box catching the heaviest and coarsest sand and the next the finer and more slimy substance, and so on. The water, finally, is pumped up to the battery floor for use again on the stamps. When the boxes are full the material therein is dropped down through traps to the sand floor, where the different grades are mixed to make it quite uniform in consistency before it is thrown into the pans. As is usually known the pans are provided with agitators, by which the pulp is kept stirred to a ropy state during the process of amalgamation. The water in the pans is kept heated by live steam from the boilers.

The mill is located on the side of the mountain, some 300 feet higher than the ore landing of the mine shaft. The ore is carried from the mine to the crushing floor of the mill by a tramcar line; a second tram line carries the concentrates from the vanner floor to the railroad track; a third train conveys coal from the railroad to the mill boiler room. The engine room contains a 500 H. P. engine.

Eureka, Sept. 27. WASCOTT.

(Special Correspondence). — The Star Con. mine, which has been greatly improved within the last few months, is shipping one car per day of gold-bearing ore, which runs in value from $1200 to $1500 per car. The ore is largely oxidized, and it is claimed much of the gold is in a sylvanite. Present shipments come from the second, third and fourth levels. Recently a new ore body was opened on the fourth level in a drift some distance from the shaft. Besides the shipping ore, a large tonnage of milling ore is accumulating at the mine. Besides the gold values, the ore carries silver, which averages about ten ounces per ton. The work is in charge of Supt. C. F. Packard.

The Boss Tweed, located a short distance from the Star, but farther up the hill, is being worked under lease to Wm. Gundry & Son, who are shipping about one car per month of high-grade copper ore, which is found in sulphide and oxidized form, mixed with red, vitreous and silicate copper, with apparently some green copper carbonates, all making a display of variegated colors.

The South Swansea has built a new shaft house, put in new hoisting machinery and sunk a 650-foot shaft about 100 feet from the old shaft. The new shaft, through which all the ore will be handled in the future, is 30 feet west of the vein at the 650 station. It is expected that present shipments will be increased. The ores here are silver and lead.

The Carissa and Spy, a group belonging to a Colorado company, at the head of which is Eben Smith of Denver, are being rapidly put in position to increase their output. The Carissa now ships 300 tons per month of gold, silver and copper ore from the 100-foot level. The ore carries about three ounces gold to the ton. The copper occurs as gray copper and copper carbonates. The gold is in quartz, spar and baryte crystals. The Spy, one of the old properties of the district, is being put in good condition, as regards equipment and buildings. The shaft is 700 feet deep. The ore now being taken out carries copper in an oxidized and carbonate form, with also some native copper and iron; the whole, it is believed, runs 20% copper. Present shipments amount to about seventy-five tons per month. About twenty-five men are employed at the Carissa and twenty at the Spy. A. J. Underwood, formerly at Victor, Colo., is manager of both properties. WASCOTT.

Silver City, Sept. 30.

(Special Correspondence).—Within the past year a steel structure has been erected over the Grand Central, making a shaft house, blacksmith shop, engine room and boiler room, all under one roof, but suitably divided off. Over the 1100-foot shaft is a 50-foot steel gallows frame, extending to the apex of the main steel building. The hoisting equipment consists of an engine with 18-inch cylinder and 48-inch stroke; a double reel for 4½-inch flat cable. The hoist is good for 2000 feet depth, with a maximum speed of 2000 feet per minute. The air compressor is a fine piece of machinery, having piston inlet air cylinder, 18¼x32 inches; with 16x32 steam cylinder. It is the right hand half of an eighteen-drill duplex and consequently has nine-drill capacity. The power comes from two 80 H. P. return tubular boilers.

The electric signal system works perfectly. It produces flashlights for station signals and has closers on cage by which bells may be given the engineer while cage is in motion. A 6-inch, riveted, spiral, sheet-iron pipe is in use for conveying compressed air from compressor to the 1100-foot level; in the drifts 3-inch iron pipe is used. An air pressure of ninety pounds per square inch is used.

The Grand Central vein has been opened vertically from the fourth to the eleventh levels and in length 1000 feet. The ore occurs in the blue dolomite line; the vein, which generally is vertical, ranges in width from 5 feet to 125 feet. The workings are timbered up in square sets. The ore, which at present comes from drifts about 500 feet east of the shaft, consists of sulphides, oxides and chlorides, carrying gold, silver, copper and lead. Most of the gold is found in the oxidized ore; the silver in the sulphides and chlorides. The dry ore averages thirty-five ounces silver, $15 to $20 gold and 10% copper; separate from that are the sulphide ores which run 45% to 55% lead, sixty to seventy ounces silver and $5 to $7 gold to the ton. Shipments now run about sixty tons per day. On the premises is a large dump which is being preserved as milling ore. The development of the mine has been under the direction of Supt. Pat Donnelly.

The Emerald, in charge of M. L. Oglesby, did 1500 feet of work the past year and erected a new shaft house and gallows frame. On the 500-foot level some ore was found, though no shipments have been made as yet.

The Mammoth mine is producing about 3400 tons per month, part of which is treated at the Mammoth mill at Robinson. The ores are gold, silver, lead and copper. The mill operates sixty stamps, thirty-six vanners, twenty-eight amalgamating pans and fourteen settlers, the method of saving being similar to that of the Eureka Hill mill.

The Black Jack, belonging to Knight & Evans, has been well equipped with hoisting machinery; a 400-foot, double-compartment shaft has been sunk, from which prospecting levels are being run for ore.

Mammoth, Sept. 29.

(Special Correspondence). — The Eagle & Blue Bell group, in charge of J. C. Chrystal, is located on the Eureka side of the range and has been well equipped within the past year. This was formerly a silver producer in the main, but of late the principal values are gold. Shipments have been made with more or less regularity during the past two years. Present shipments run one or two cars a month, the returns ranging from three to seven ounces gold, with a few ounces silver. Much of the latter is in the form of a chloride. The mine contains a great deal of ore that would be adapted to concentration and the erection of a mill may be considered later on.

The Centennial–Eureka maintains the shipment of its regular tonnage. Within the past year considerable improvement in equipment has been made, including a tramway line over which the ore is carried from the mine to the ore bins at the railroad. The electric signals, which have been in use in the shaft for two years, appear to operate very satisfactorily. Not only can signals be given from station to station, but those on the cage can signal the engineer to stop or start at any point in the shaft.

The Bullion–Beck concentrating mill, which has been closed down for some time, was designed to run on the low-grade lead ores. As this class of ore has accumulated in the past the mill has always handled it, and doubtless will do so in the future. The high-grade product is always shipped to the smelters. A strike of considerable importance is reported to have been made in the Muldoon tunnel, on Bullion–Beck property, in the vicinity of the Centennial–Eureka.

The Apex, whose earlier development was through the Uncle Sam tunnel, is now sinking a shaft from an upper 800-foot tunnel to reach its lower workings, 450 feet below the latter tunnel. The Apex ore body pitches eastward 65° from the horizontal and carries a fair valuation. L. C. Doty has charge of the Apex.

The Yankee Consolidated, near the May Day, recently opened a new ore body, from which a three-car shipment was made, the values therein being a heavy lead sulphide, carrying gold and silver.

The Uncle Sam, belonging to Knight & Sons, has a record of having produced $600,000 since it was opened, its ores being high-grade lead. Some of its shipments have run as high as 70% lead, and it is stated that no shipments have run below 50%. The Humbug, in the same locality and under the same management, though not at present a large shipper, is said to have high-grade ore and will be in position to ship at almost any time.

The Victoria recently put in a hoist and sunk a shaft 550 feet, from which considerable amount of drifting was done. This belongs to the Grand Central people.

Most of the new work on the lime belt of the Tintic range, within the last two years, has been done by local people. This comprises that section running from the north end of the spur at the Uncle Sam south to Mammoth.

Eureka, Sept. 28.

SALT LAKE COUNTY.

The Liberal and Butler No. 2 at Bingham have an option by C. C. Hayden of Colorado and J. Hudgens of Arizona, they binding themselves to pay for it $50,000 before the expiration of eighteen months.

The Bulletin hears that development operations are to be resumed at the Red Wing group, under the direction of H. T. Sappington.

Improvement is noted at the Last Chance mill. A sample of old tailings assayed 2% lead, 2.5 ounces silver and $2.40 gold. Present tailings show a trace of lead, 1 ounce silver and 70 cents gold.

WASHINGTON.

J. M. Dennett says that he has "penetrated into the Cascade range 60 miles from the railroad, and after two days of prospecting located veins showing 19 feet of anthracite coal." He estimates the quantity of coal in sight at 25,000,000 tons, but may be unduly optimistic.

FERRY COUNTY.

Fifteen miles south of Republic the Ignas M. & M. Co. is developing the Ignas mines under the superintendence of E. W. Lafrances. In a belt of schist and black shale is a vein of 8 feet of ore, carrying 100 ounces in silver.

Supt. D. C. Jackling expects the new Republic mill will be ready to operate next week.

KITTITAS COUNTY.

At Liberty, L. Alstrom last week in the placers of the Swauk found a nugget which weighs 24½ ounces and is valued at $350.

OKANOGAN COUNTY.

The Okanogan Free Gold Mines, Ltd., near Oroville, is in the hands of the sheriff, who has stopped all work on the claims. Supt. Finley estimates that by sinking a shaft 150 feet deeper than the lower workings and crosscutting 100 feet the vein could be reached at a place where the ore body would be undisturbed, and figures the cost of this work at $4600.

SPOKANE COUNTY.

The mining department of the Spokane Industrial Exposition, which opened in Spokane on the 2d inst., has a good display of minerals. Among the locations which have prominent exhibits this year are Slocan, Nelson, Ymir, Ainsworth, Rossland, Boundary, East Kootenay, B. C., the Cœur d'Alenes, central Idaho, Libby, Montana, Okanogan and eastern Oregon.

WYOMING.

CARBON COUNTY.

The first carload of machinery for the Grand Encampment smelter has arrived at Wolcott station.

Native copper is being found in the Ferris-Haggarty in the 200-foot level.

FOREIGN.

BRITISH COLUMBIA.

At Sandon the Ivanhoe mill, belonging to the Minnesota Silver Co., has started up. The concentrator has a capacity of 200 tons a day. P. Hickey is Supt.

One million shares of the Rossland Giant are reported bonded to San Francisco men for $100,000. The bond goes into effect Oct. 1, and is for two years. In that time the bondholders, according to the agreement, must sink a new working shaft 700 feet, do 1000 feet of tunneling and 1000 feet of diamond drilling. The old owners are to receive 55% of the net proceeds from ore shipped during the two years; the other 45% will be held in escrow as a protection to them should bonders break the contract.

At Nanaimo, September 30, at a meeting of the Miners' Union the question of a 10% increase was reopened and it was decided to ask for the raise.

"Miners (200) wanted to go to British Columbia; passage advanced; wages 12 shillings per eight hours' day. Apply for further particulars to E. 2780, Mail office."

The above advertisement appears in the issue of the 8th of September of the Glasgow Mail.

Nelson reports that a new straight-line roasting furnace is to be installed at the Hall mines smelter. The hearth is 12 feet wide and 120 feet long.

The Jaune de Lamare syndicate is operating fifteen hydraulic leases, comprising about 1000 acres of auriferous gravel, at Boulder Creek, Atlin. Twenty men are at work with two monitors.

Kamloops reports a strike of cinnabar at the mines near Savona, where work was recently resumed.

In the Lenora copper mine on Mt. Sicker, Vancouver Island, its shipments average 1200 tons a month. The ore runs $2.50 in gold, $2.50 in silver and 10% wet assay of copper to the ton.

At Greenwood the first ore shipments to the smelter took place on the 26th. The smelter will not be in operation until December.

The Granby smelter will ship about 150 tons matte to New York.

At Nelson the recent payment of a 5% dividend on the capital stock of the Athabasca is to be repeated quarterly.

About 1800 tons of concentrates of lead from the St. Eugene mine at Moyie have been shipped to a copper smelter at Antofagasta, Chile. The British Columbia product is used for fluxing purposes. There is an unlimited market in Chile for concentrates of lead.

BRITISH GUIANA.

U. S. Consul Moulton to Demarara, British Guiana, says the rush to the gold fields of Guiana and Venezuela, which was expected to follow the settlement of the Venezuela boundary dispute, failed to materialize. The new boundary fixed by the arbitration court is quietly accepted by the people of British Guiana and Venezuela. Gold mining is being prosecuted in the British Guiana gold fields, and a few Americans are there trying to make their fortunes. The yield of those gold fields is about $2,000,000 a year. All the gold obtained is secured by placer mining. Mining in British Guiana is attended by the greatest difficulties and hardships, and there is danger to life. The gold fields are all at some distance in the interior. To reach them the miners have to travel through swamp lands and dense brush, which are infested by alligators, enormous reptiles and wild beasts. Everything the miners carry along has to be packed by men. British Guiana is no place for American miners.

LOWER CALIFORNIA.

Ensenada, capital upper district of Lower California, reports that Benton, Ramsdale & Stevens have deposited with the Secretary of Mines for the northern district of Lower California, $75,000 in silver, and filed denouncements for nearly 4000 claims to copper mines in the interest of Montana parties. The denunciations begin as far south as San Fernando, where the greatest number of claims are, and run through the known copper country as far north as San Ysidro. Each claim is 40 meters square. There is no limit to the number that one may file upon, provided he pays the location fees.

SOUTH AFRICA.

All points of view are interesting. R. Redmon, from Johannesburg, who says he has been connected with newspapers in South Africa for seven years, says that the Transvaal of the future will not compare with the republic under Boer rule. He thinks it will be twelve months before the gold mines of the Rand can be cleared of water and the machinery put in working order; the chief difficulty or menace to the welfare of the ordinary working individual will be the consolidation of mining interests, the amalgamation of the various gold trusts into one gigantic corporation that will shut out the miner and ordinary workingman from the chance they might have had. This fact is evident, the consolidation is sure. "One has only to turn to Kimberley, the diamond district, and observe the limited amount of labor required to work that great diamond country. I recall the time when Kimberley employed thousands of workingmen of all classes, when every auriferous field was thrown open to the public, when every individual worked on a basis of equality as regards the natural wealth of the ground, when the working miner had the same opportunity of a rich find as the capitalist who might own the next claim. Everything prospered. Rhodes and his party were able to amalgamate the various interests and buy out the smaller people. Competition was useless. The great De Beers diamond trust was formed, which to-day rules the diamond market of the world. Very naturally the output of diamonds was curtailed in order to keep up market prices. Thousands of workmen were left to starve, and the once prosperous colony of Griqualand West became a slow mining village, with only the De Beers company to keep it afloat. Later on these self same workmen, miners, chiefly Americans, found employment on the Johannesburg gold fields, and were satisfied to work under the government of the Transvaal. All mining claims were distributed fairly to taxpaying citizens, and the Uitlander had the same opportunity as the Boer. In fact, the ordinary Boer was satisfied to work on his farm and leave the gold to the more progressive European or American. It needs very little prophetic insight to predict the South Africa of the future. The same conditions must prevail on the Witwatersrand as were put in force in Kimberley, as the controlling interests are held by the same men. Cecil Rhodes is the head of the great diamond trust, and is the largest shareholder in Transvaal mining companies. With the exception of a few American, German and French companies, the whole of the Transvaal is in the hands of the Rhodes interest. Under the new rule, therefore, the only issue will be the speedy consolidation of the mining interests, the closing of the smaller mines and the regulation of the output of gold to suit the London market. Instead of a city of 120,000 inhabitants, Johannesburg will take a turn after the manner of Kimberley, and become merely a small mining town, controlled by the Rhodes Consolidated Gold Mining trust. Interested publications prophesy a coming 'boom' in African stocks and shares, but the boom can be safely put down as imaginary. It will not come. On the contrary, many of the smaller companies will go into liquidation and the interests will be bought up by the larger trusts. Miners and tradesmen will not find employment in the Transvaal under the new rule. The volunteers now fighting will, of course, be given the first chance, and very few men will be required to work the consolidated mines."

Personal.

A. B. SNOW has returned to Montana from Siberia.

C. E. LOOSE has returned to Utah from San Francisco.

T. B. COMSTOCK of Los Angeles, Cal., is visiting San Francisco.

J. B. TREGLOAN is now Supt. Melba mine, Calaveras Co., Cal.

E. A. WILTSEE of San Francisco is visiting Cripple Creek, Colo.

CHAS. C. DERBY of New Almaden, Cal., has returned from his visit to the Orient.

D. H. JACKSON of El Dorado Co., Cal., will remain another year at Cape Nome, Alaska.

R. C. GEMMELL, Utah's State Engineer, is in Alpine county, Cal., sampling mining property.

WM. DENNIS has resumed the superintendency of the Mountaineer mine, Nevada Co., Cal.

LETSON BALLIET, who has extensive mining interests in eastern Oregon, is in San Francisco.

JNO. R. PHILLIPS has returned from the East to the Amador Queen mine, Amador county, Cal.

W. H. STORMS of San Francisco will shortly take charge of the Baliol mine, Amador county, Cal.

W. E. TERHUNE goes as Supt. Coconino Co.'s new plant on the Colorado river, northern Arizona.

E. A. DAVIS, Supt. Ribbon Rock mine, has returned to El Dorado county, Cal., from San Francisco.

HENNEN JENNINGS, WM. MEIN AND F. BRADLEY have returned from Grass Valley, Cal., to San Francisco.

S. T. CURTIS, a Comstock mining superintendent, has been offered the management of a mine in Dutch Guiana.

W. A. AKERS has returned to Salt Lake City, Utah, from an examination of gold properties in Park county, Colo.

SAM'L W. OSGOOD has resigned his position at Crystal Falls, Mich., to accept the superintendency of the Copper Harbor mine, Keweenaw, Mich.

ALEX. HILL of London, England, representing the English stockholders of the Pacific Northwest M. Co., is at Libby, Mont., examining the Snowshoe mine.

H. R. BOSTWICK, who recently completed an electric railway at Seoul for the Emperor of Korea, and aided in routing a mob which attacked the line, has returned from the Orient to San Francisco.

Commercial Paragraphs.

THOS. KANE & CO., 64-66 Wabash Ave., Chicago, are sole sales agents for the American Spiral Pipe Works.

THE Jeanesville Iron Works Co.'s Denver office reports recent sales and shipments: Diamond mine, Leadville, Colo., two station pumps; No. 9 B sinker to Butte, Mont.; No. 9 B sinker to Independence, Colo,; No. 5 sinker and station pump to Central City, Colo.; station pump to Colorado & Southern Railroad, 1000 gallons per minute.

THE Jeffrey Manufacturing Co. of Columbus, Ohio, have received the following letter from F. E. Drake, director of machinery and electricity, United States Commission to the Paris Exposition of 1900, Paris, France: "I am pleased to inform you that your company has been awarded a gold medal in Class 63, a silver medal in Class 23 and a bronze medal in Class 21 for your exhibits in these classes by the international jury." This covers their line of chain-belting elevating and conveying machinery and coal-mining machinery.

THE Sullivan Machinery Co. of Chicago is extending its western agencies. In addition to the Denver office, in charge of Mr. R. D. Hunter, the Sullivan Co. has now established a branch office at 101 South Howard St., Spokane, Wash., in charge of Mr. M. J. Ready, who has a complete line of rock drills, diamond drills and supplies for same. The Sullivan Co., Chicago, has moved the main Chicago offices from 54-60 North Clinton St. to the Merchants' Loan and Trust Building, 135 Adams St., Rooms 1220-1221. The store and shipping department will remain on Clinton St.

THE New Process Raw Hide Co., Syracuse, New York, furnish rawhide pinions of a style and quality commended by many users of high-speed geared machinery. The company claims that the pinions they make are long-lived and also prolong the life of the metal wheels with which they mesh, reducing vibration, and serving as a good insulator. They supply either spur, bevel or friction pinions, as desired. Their further claim is that as is steel to iron so is new process rawhide to all other rawhide. This is an age of specialties. They make rawhide pinions, which are used by the U. S. Government and more than 200 electric railways. They have attained a good reputation, and propose to maintain it.

SQUIRE V. MOONEY, manager The John A. Roebling's Sons' Company, 25-27 Fremont street, San Francisco, has notification that that company, with headquarters and manufactory at Trenton, New Jersey, has received for its exhibit at the Paris Exposition two grand prizes and two gold medals, the highest honors within the gift of the Exposition authorities. The Roebling display at the Exposition consisted of two exhibits, one the products of the company's electrical department, the principal feature a full size model of a section of underground trolley track, illustrating the communications with the conductive bars and the lead-encased cables which transmit the current to the cars, the other exhibit in the department of metallurgy, giving comprehensive view of all the products of the Roebling works, with the exception of the electrical conductors. Part of that exhibit contains samples of every variety of steel and copper wire, from the largest sizes made to wire with a diameter of $\frac{1}{1000}$ of an inch. This latter is so fine that it is impossible to detect it between the fingers. It is half as thick as the finest human hair, and a mile of it weighs about a quarter of an ounce. It is drawn through diamond dies, and is a good example of the skill displayed by the workmen in the process of manufacture. The Roeblings have exhibited at all the prominent expositions for a number of years and possess many awards conferred, including gold and other medals. At the Centennial, at the World's Fair in Chicago and at the Philadelphia Export Exposition the excellence of its manufactures was acknowledged. The Roebling Company in the last two years has built a large wire mill, and has in its employ about 3000 operatives.

Obituary.

HENRY C. BALLARD, the man who built the Loop above Georgetown, Colo., died on the 24th ult. at Tie Siding, Wyo., where he was superintending railroad construction on the Union Pacific.

J. G. LAWS, well known for many years in Nevada and California as a journalist, died on Sept. 20th at Cinnabar, Trinity county, Cal., where he was Supt. of the Integral quicksilver mine. Fifteen miners from the Integral, Altoona and other mines carried the body down over the long and rough mountain trails to the railroad, and the train brought it to Oakland, Cal., where his family lives.

List of U. S. Patents for Pacific Coast Inventors.

REPORTED BY DEWEY, STRONG & CO.,
PIONEER PATENT SOLICITORS
FOR PACIFIC COAST.

FOR WEEK ENDING SEPTEMBER 25, 1900.

658,333.—TOWEL RACK—E. C. Alford, Moro, Or.

658,616.—BROOM HOLDER—H. Blome, McMinnville, Or.

658,479.—TIRE REMOVER—B. M. Buckland, Poplar, Cal.

658,718.—SPEED GEAR FOR BICYCLES—J. A. Cardinell, S. F.

658,497.—METALLIC LATHING—M. Carrick, S. F.

658,482.—CHECKING DEVICE—C. J. Castera, Jr., Los Angeles, Cal.

658,358.—TOP—W. R. Ellis, Livermore, Cal.

658,708.—GUN SIGHT—S. E. Fischer, S. F.

658,709.—GUN SIGHT—S. E. Fischer, S. F.

658,500.—AXLE NUT—W. H. Holliway, Oakdale, Cal.

658,647.—HAY RAKE—J. H. Hughes, Alicel, Or.

658,374.—ADVERTISING DEVICE—J. N. Johnson, Prescott, A. T.

658,503.—BED BOTTOM—G. H. McBride, S. F.

658,728.—BOILER FEEDER—H. C. Needham, Los Angeles, Cal.

658,672.—STAMPING MACHINE—C. M. Pierce, Weston, Or.

658,397.—THILL COUPLING—O. H. Platt, Chico, Cal.

658,533.—DOOR CHECK—D. Schuyler, San Diego, Cal.

658,516.—NOZZLE DEFLECTOR—J. W. Smith, Weaverville, Cal.

658,687.—FIRE ESCAPE—J. M. Swift, Selma, Cal.

658,495.—EARTH DRILL—H. E. Williams, San Jose, Cal.

658,692.—HOSE COUPLING—R. Williams, Walla Walla, Wash.

658,496.—WAGON GEAR—G. T. Willis, Fresno, Cal.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

AUTOMATIC FLUSHER.—No. 658,139. Ira P. Clarke, Alameda, Cal. The object of this invention is to provide an automatic apparatus for the flushing of sewers and the like at frequent intervals. It consists of a chamber or receptacle having an opening connecting with the sewer, and a valve by which the opening is closed. A float is suspended from one end of a lever fulcrumed above the valve, and a weighted traveler is movable to and from the fulcrum point on the opposite side of the lever. A chain connects the traveler with the valve so that when the float has risen to a certain point the traveler will be disengaged, and will move quickly to the outer end of the lever, thus suddenly opening the valve to allow the escape of the water. As the water discharges the float will sink, and will again tilt the lever into such position that when the tank is approximately empty the traveler will rapidly return toward the center of the support of the lever, and slackening the chain will allow the valve to close suddenly upon its seat. The flow of water being continuous will cause this operation to continue automatically and indefinitely.

MANUFACTURE OF FLAT WIRE CABLES.—No. 658,118. Sept. 18, 1900. E. I. Parsons, San Francisco, Cal., assignor to the American Steel & Wire Co. of Chicago, Ill. This invention relates to an apparatus which is used in the manufacture of cables, such as are made by laying a series of ropes side by side, and stitching them through to form a flat cable. The difficulty in manufacturing this class of cables arises from the unequal tension upon the transverse sewing wires caused by different power applied in pulling the wires through. In this invention the pull upon the stitching wires is made approximately the same by means of a bar having a hook upon one end, through which the pull is exerted. There is a shank or stem upon which the hook bar is slidably guided, said shank having a handle and a yielding spring and latch mechanism through which connection is made between the handle and the shank. There is a device by which the latch is disengaged when a given tension has been reached so that the pull upon the stitching wire will always have the same tension, and if this is exhausted the latch disengages and relieves the pull.

DEFLECTOR FOR HYDRAULIC NOZZLE.—No. 658,516. Sept. 25, 1900. J. W. Smith, Weaverville, Cal. The object of this invention is to provide a means for changing the direction of hydraulic nozzles through which water is discharged under a high rate or great pressure. It consists of a supplemetal pipe, and means for supporting it axially in line beyond the main nozzle, with a lever or means by which it can be turned to either side, or up and down, so that the stream of water issuing from the nozzle will impinge upon this extension, and will, by thus acting upon it, turn the main nozzle to the opposite direction by the reactionary force of the water upon supplemental nozzle, while the latter is held in this position. When the supplemental nozzle is released it will of itself return to a position in line with the main nozzle and will not interfere with the stream which is discharged therefrom.

BED BOTTOM.—No. 658,053. Sept. 25, 1900. G. H. McBride, San Francisco, Cal., assignor of $\frac{51}{100}$ to D. H. Bibb, of same place. This invention consists of a rectangular bed bottom frame with spirally twisted elastic cables having their ends fixed to the opposite ends of the frame and intermediate between the ends, the cables are interlaced in such a way that they mutually support each other, and by being immovably interlocked any pressure which may be brought upon one side or the other is transmitted so that all of the cables sustain a portion thereof. The usual top mattresses are placed upon this structure to complete the bed.

Latest Market Reports.

SAN FRANCISCO, Oct. 4, 1900.

SILVER—Per oz., Troy: London, 29½d (standard ounce, 925 fine); New York, bar silver, 64c (1000 fine); San Francisco, 63⅞c; Mexican dollars, 51¼c.

There is a noticeable rise in silver, editorially discussed on page 398. Regarding the Government purchases of silver, it is to be noted that the Government at present purchases only such silver as is contained in gold deposits from the Klondike and other gold-producing sections. Under the existing statute all silver in gold deposits is paid for at the market price. The advance is a good thing for Western silver-lead producers. The Bulletin reports specie shipments from San Francisco during the month of September as follows:

To Hongkong—		
Silver bars	$ 334,732	
Mexican dollars	2,535,308	
Gold coin	11,343	
		$2,881,383
To New York—		
Gold coin	$ 29,260	
Silver coin	18,580	
Currency and bonds	1,460	
		49,300
Total		$2,930,683

For the first nine months of the year shipments were:

Gold bars	$ 3,278
Silver bars	3,539,174
Mexican dollars	7,960,230
S. A. dollars	35,827
Silver coin	339,022
Gold coin	3,818,562
Gold dust	2,650
Japan gold	......
Currency and bonds	2,547,244
Total	$18,245,987

COPPER.—New York: Lake, 1 to 3 casks, $17.00 cash; carload lots, 16.75; Electrolytic, 1 to 3 casks, 16.87½; carload lots, 16.62½; Casting, 1 to 3 casks, 16.75; carload lots, 16.60. San Francisco: 18. Mill copper plates, 20c; bars, 22@23c.

LEAD.—New York, $4.37½; Salt Lake City, $4.25; St. Louis, $4.32½; San Francisco $5.00, carload lots; 5½c 1000 to 4000 lbs.; pipe 6¾, sheet 7½, bar 6c; pig, $4.70 @5.10. London, £17 17s 6d.

SPELTER.—New York, $4.15; St. Louis, $4.00; San Francisco, ton lots, 5½c; 100-lb lots, 5¾c.

ANTIMONY.—New York, Cookson's, 10½c; Hallett's, 9½c; San Francisco, 1000-lb lots, 12c; 300 to 500 lbs., 13@14c; 100-lb lots, 15@18c.

IRON.—Pittsburg, Bessemer pig, $14.00; gray forge, $13.50; San Francisco, bar, per lb., 2.50c in small quantities.

STEEL.—Bessemer billets, Pittsburg, $17.50; sheet bars, $22; San Francisco, bar, 7c to 12c per lb.

The steel rail pool has fixed the price of steel rails for the coming year at $26 per ton—$9 per ton cheaper than last year and $1 higher than it was expected the rate would be. On 80-pound rails that is a reduction of $1131.40 to the mile in the cost of rails.

The rail makers, in reducing steel rails from $35 to $26, a reduction of about 25%, figure a market for, in round figures, 2,000,000 tons of rails, or the bulk of the rails that will be needed for the requirements of 1901. There is considerable profit at $26.

The price for Bessemer pig is $14 and of slabs $17.50. A slab is a steel rail in the form of a chunk of steel. For nominal cost it is rolled out long into steel rail. For this $3 is the charge. At this cost steel rail is worth $20.50 per ton.

TIN.—New York, pig, $29.75; San Francisco, ton lots, 31c; 1000 ℔s., 31¼c; 500 ℔s., 31½c; less, 32c; bar tin, ⅌ ℔, 34½c.

QUICKSILVER.—New York, $51.00; large lots: London, £9 2s 6d; San Francisco, local, $48.50 ⅌ flask of 76½ ℔s.; Export, $45.50.

NICKEL.—New York, 50@60c ⅌ ℔.

MAGNESIUM.—New York, $3.00 ⅌ ℔.; San Francisco, $4.00.

ZINC.—San Francisco, 5½c; slab, 6c; bar, 7¾c.

SOLDER.—Half-and-half, 100-℔. lots, 20½c; San Francisco, Plumbers', 100-℔. lots, 17¼c.

BABBITT METAL.—San Francisco, No. 1, 10c.

ASSAY LITHARGE.—San Francisco, 10c ⅌ ℔, small lots.

BISMUTH.—New York, ⅌ ℔., $1.60 50-℔ lots; San Francisco, $2.50 to $2.75 ℔ lots.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 35c.

PHOSPHORUS.—F. o. b. New York or Philadelphia, 45@50c ⅌ ℔.

TUNGSTEN.—New York, ⅌ ℔., 95c; San Francisco, $1.15.

FERRO-TUNGSTEN.—New York, 37%, 35c; San Francisco, 65c (60%).

FERRO-MANGANESE.—Pittsburg, 80%, domestic, $85, large lots.

PLATINUM.—San Francisco, crude, $17 ⅌ oz.; New York, $18.25; manufactured, $19.50@22.00.

POWDER.—F. o. b. San Francisco: No. 1. 70% nitro-glycerine, per ℔., in carload lots, 15¼c; less than one ton, 17¼c. No. 1*, 60%, carload lots, 13¼c; less than one ton, 15½c. No. 1** 50%, carload lots, 11¾c; less than one ton, 13¾c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2 per keg.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9, in lots not less than 1000.

FUSE.—Triple tape, $3.60 per 1000 feet; double tape, $3.00; single tape, $2.65; Hemp, $2.10; Cement No. 2, $3.00; Cement No. 1, $2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 11¾c ⅌ set; 14 oz., 40s., 10½c.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 32½@33½c ⅌ ℔.; carloads, 30@31c; in 10-℔. tins, 40c; sulphuric acid, 66% B, 2c ⅌ ℔.; soda ash, $1.60 ⅌ 100 ℔s. 58%; hyposulphite of soda, 2¾@3c ⅌ ℔.; blue vitriol, 5½@6c ⅌ ℔.; borax, concentrated, 7@8c ⅌ ℔.; chlorate of potash, 12@13c; roll sulphur, 6c; alum, $1.90@2.00; flour sulphur, French, 2¼@2½c; California refined, 1¾@2c; nitric acid, in carboys, 8c ⅌ ℔.; caustic soda, in drums, 3@4c ⅌ ℔.; Cal. s. soda, bbls., $1.00; sks, 95c ⅌ 100 ℔s.; chloride of lime, spot, $2.50@2.60; nitrate of potash, in kegs, 8c; caustic potash, 10c in 40-℔. tins.

OILS.—Linseed, pure, boiled, bbl., 75c; cs., 80c; raw, bbl., 73c; cs., 78c. Deodorized Stove Gasoline, bulk, 15c; do., cs., 21c; 86° Gasoline, bulk, 21c; do., cs., 27c; 63° Naphtha or Benzine, deodorized, in bulk, per gal., 14c; do., in cs., 20c; Lard Oil, Extra Winter Strained, bbl., 70c; cs., 75c; No. 1 bbl., 50c; cs., 55c; Neatsfoot Oil, coopers' bbls., 60c; extra bbls., 65c; cs., 60c; No. 1 bbl., 52½c; cs., 57½c.

The Standard Oil Co. has reduced the price of crude oil 5 cents per barrel to $1.20 The price has remained stationary at $1.25 for about two months.

Refined petroleum in New York has been reduced 20 points to $7.85 in barrels and $5.30 in bulk, Philadelphia prices being on a basis of 5 points lower.

COAL.—San Francisco, coast, yard prices: Wellington, $9; Seattle, $7.00; Coos Bay, $5.50; Southfield, $9.00. Cargo lots, Eastern and foreign: Wallsend, $8.00; Brymbo, $7.50; Pennsylvania, hd., $14.00; Scotch, $8; Cumberland, $12; Cannel, $9.50; Welsh Anthracite, $12.00; Rock Springs, $8.50; Colorado Anthracite, $14.50. Coke, $16 per ton in bulk; $18 in sacks.

For Sale in Lots to Suit.

REDINGTON & COMPANY, Wholesale Druggists, 23-25-27 Second Street, San Francisco.

FOR SALE.

For Sale or Bond---Very High Grade Copper Property Located in Arizona.

JOHN M. VRCHOTA, La Crosse, Wis.

FOR SALE.—A MAMMOTH GOLD MINE OF free milling ore. Never before offered for sale. A rare opportunity for large capitalists or a strong syndicate. Apply to E. J. FRASER (sole agent for owners), 522 Parrott Building, S. F., Cal.

A group of 12 Colorado high-grade gold mines are now offered for sale for the first time. Wide veins of rich, free-milling ore. Plenty of wood and water. Good roads, and near R. R. station. Title U. S. Patents. Capitalists or their special agents only need apply. Buyer and seller brought together for negotiations. Address E. J. FRASER (sole agent for owners), Room 522, Parrott Building. S. F., Cal.

FOR SALE.

Lease and Bond, Eighteen Months, Easy Terms, Copper Property, New Mexico.

High grade ore with good gold values. Accessible. Plenty wood and water. Strong vein. Three shafts. Will pay from start. Adjoins large producing mine. **H. E. RUNKLE, El Paso, Texas.**

Hoist on Hand for Immediate Shipment.

A first-class Steam Hoist, double 10x12 cylinders, drums 48″ dia. by 30″. For specifications, price, etc., address Mining and Scientific Press.

FOR SALE,

Lease or Bond, 6 Months' Time.

80,000 acres of timber lands at La Tesca Municipality, Ahuacatlan, Tepic, with mineral deposits—gold, silver, zinc and land. Water power close to the mines. Address to

Prospecting Machinery.

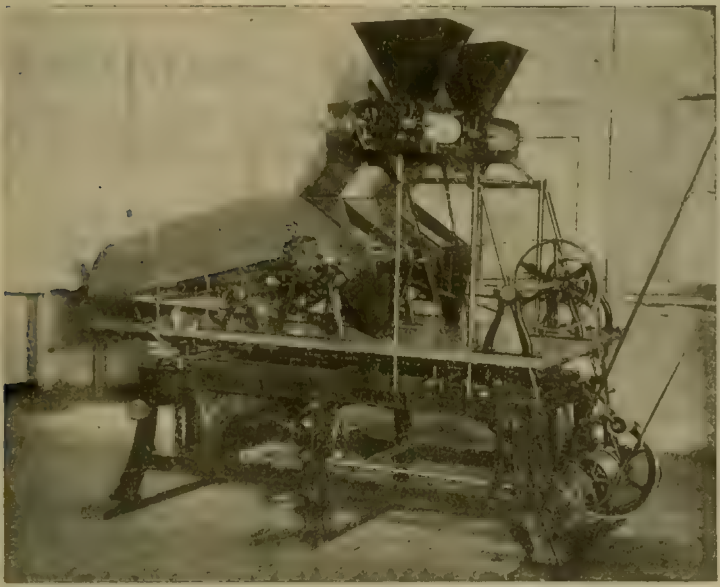
Multitudes in use for testing for minerals. Sizes and equipments to suit any and all conditions. Unexcelled for Placer Testing, Oil Wells, Water Wells, testing for Lead and Zinc, Iron and Coal; goes through anything; brings up everything. Large sizes drill as much as 1500 feet. In use all over the world. Every purchaser pleased. Used on boats for testing river and lake beds. Water no hindrance. No skilled labor required.

KEYSTONE DRILLER CO., Beaver Falls, Pa., U. S. A.

CROWN GOLD MILLING CO.

Manufacturers of the "CROWN" CONCENTRATOR and CROWN ORE SIZER. A dry process of sizing and concentrating ore, sand or gravel. Designed to accord fully with the laws of specific gravity, and especially adapted to refractory ore or localities where there is no water.

The chief claims for the Crown Concentrator are that it occupies less floor space and has nearly four times the capacity of any wet concentrator; that it will concentrate ores containing base and refractory metals that ordinarily slime and carry off values; that it effects a saving of values far above the ordinary methods of concentration.



We have, now in operation, a complete plant for crushing, sizing and concentrating ores by the

Crown Dry Milling Process.

Mine owners desiring tests made can forward us, freight prepaid, not less than 1000 lbs. nor more than 4000 lbs. of sample, for which a charge of $20 will be made. (This amount includes assaying, etc.)

Ores for which this process is adapted and of which consignments are solicited are any concentratable ores, pulps, tailings, or sands, carrying sufficient values, whether they have heretofore been profitably concentrated or not.

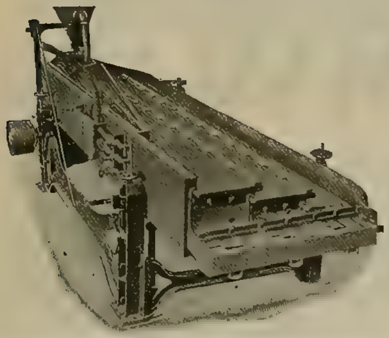
THE IMPROVED BARTLETT CONCENTRATING TABLE.



The BARTLETT CONCENTRATING TABLE has been GREATLY IMPROVED recently by the substitution of iron in place of wood wherever possible. It is now built with SOLID IRON TOP, PLANED TO A TRUE SURFACE AND POLISHED; all parts are made by template and EACH PART BEING INTERCHANGEABLE. As now constructed, the table has no special wearing parts and will last for many years. It has a CAPACITY OF FROM FIFTEEN TO FORTY-FIVE TONS IN TWENTY-FOUR HOURS, according to the class of ore worked. It is the only table in the world which will take the place of jigs and do away with all costly and complicated machinery.

It is Especially Designed for Separating Zinc from Lead.

Send for our illustrated catalogue, containing all the latest information on the concentration of ores.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & CO.'s Patent Agency will have the benefit of a description in the *Mining and Scientific Press.* We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

SMOOTH-ON
TRADE MARK
CASTINGS.

An iron cement for repairing leaks or fractures in steam or hydraulic work. When hard it will withstand a red heat, steam, water or oil, and expands and contracts with heat and cold the same as iron, insuring a tight joint at all temperatures. Difficult flange connections can easily be made with Smooth-On, as it adapts itself to the flanged faces whether parallel or not. Connections are easily taken apart. Unequaled for boiler patching, and repairing blemishes in iron castings. Write for catalogue and prices. Sole proprietors and manufacturers: Smooth-On Mfg. Co., Jersey City, N. J., U. S. A.

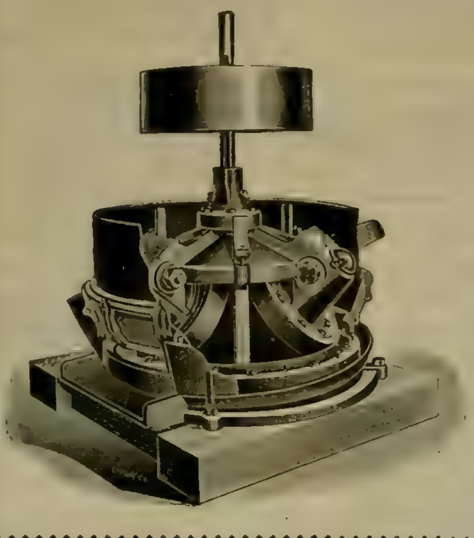
SOUTH MILWAUKEE, WISCONSIN.



THE GRIFFIN

THREE ROLLER

ORE MILL.

The Griffin Three Roller Ore Mill is a simply constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilian Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

WOODBURY'S IMPERIAL CONCENTRATING TABLE.

THE Imperial Concentrating and Amalgamating Table is the latest invention of Mr. Geo. E. Woodbury, whose fame as one of the pioneer concentrator builders is world wide, machines of his manufacture being in general use in every country on the globe where the milling of ores is carried on. This Table is, however, built on entirely new lines, differing materially from either the well-known belt or bumping table types of concentrators.

SIMPLE IN ITS CONSTRUCTION. SAVES FINE SULPHURETS.

WITHOUT LOSS IN TAILINGS.

MAKES HIGH PRODUCT. CAPACITY FROM 5 TO 10 STAMPS.

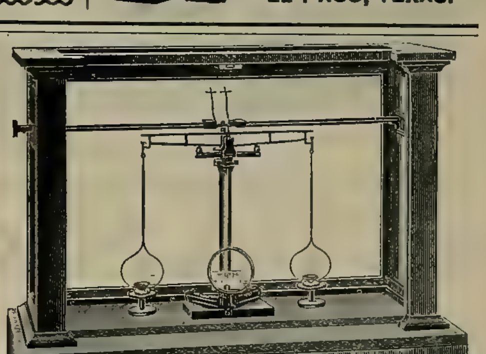
EL PASO, TEXAS.

Operator taking courses or horizontal angles with BRUNTON'S PAT. POCKET MINE TRANSIT.

If you wished to find the angle between two points below the horizontal with a sighting compass or an ordinary transit, you would first have to set up your tripod or staff and then level up your instrument. All this takes time.

If you only wanted to get the angle within a degree or so, you could take a BRUNTON TRANSIT, and, holding it in the position shown, take your readings in less time than you can dlace any other instrument. Send for descriptive catalogue B to



No. 044 BUTTON BALANCE. Sensibitity 1-100 milligramme. If you are in the market for the very best balance obtainable at a moderate price, write us for particulars about the No. 044. You will be surprised to find how cheaply it can be purchased for cash. While we cannot recommend this balance for fine gold work, a great many assayers are using it for such successfully. Send for illustrated catalogue A, for complete description and prices, to

IMPROVED BONE ASH.

It is 100% better than Bone Ash now being used; will absorb more lead, will never crack or split in the Muffle, can be dropped before or after using without breaking. Cupels can be made and used at once; no drying required. Excessive heat has no effect on them. Will stand shipping any distance. It takes up none of the precious metals in cupeling. Cupels much quicker. Once used always used. Sold under a positive guarantee or money refunded. Now being used by all smelters and assayers who have tried it.

Correspondence solicited.

Samples given if required.

THE COPPER FURNACE

Here illustrated has OUR PATENT

WATER VAPORIZING ATTACHMENT.

Experience has proven this to be the best of all methods for applying water for the cooling of jackets. It has the further great advantage of using only about one-eighth the usual amount of water needed for that purpose, and all jackets are kept at the same temperature.

We Manufacture Smelting Furnaces and Equipments

FOR THE TREATMENT OF

GOLD, SILVER, LEAD, COPPER and NICKEL ORES.

of any desired tonnage capacity above forty tons per day, and put them into successful operation under guarantee. Write for catalogue showing different styles of furnaces.

We also design, manufacture and erect Smelter Sulphide Mills for crushing and sampling ores. We are the originators of the Narrow Face, Large Diameter, High Speed Crushing Rolls. A full description of our Crushing Machinery is given in a special catalogue, which will be sent on application.

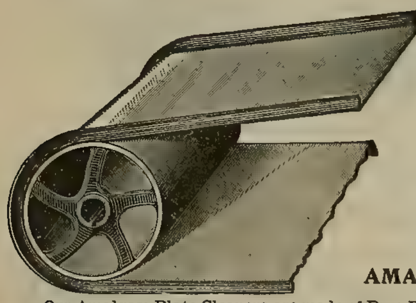
THE COLORADO IRON WORKS CO.

ESTABLISHED 1860.

DENVER, COLO., U. S. A.

SPADONE'S CONCENTRATOR BELTS.

PATENTED.



This illustration shows the edge flanging outwardly as it passes over the pulley. This relieves the strain from the top and bottom of the edge by directing the strain automatically to the inside face surface of the edges. Heretofore all belts have been so constructed that when they pass over the pulleys or rolls, a direct strain comes upon the top or at the base of of the edges, causing the edges to break away from the body of the belts in a very short time. *We avoid this Mechanical Defect by our Spadone Curved Edge.* Belts made to fit any machine—4, 5 and 6 feet wide. Prices and samples on application.

AMALGAM PLATE CLEANERS.

Our Amalgam Plate Cleaners are made of Pure Rubber in moulds, thus insuring a plate cleaner which will not scratch the plates and a perfect edge which will clean the Amalgam plates evenly. They are made 6 inches long, 3 inches wide and ½ inch thick, making a convenient size to handle. Price by mail to any address, each 75 cents. Correspondence solicited.

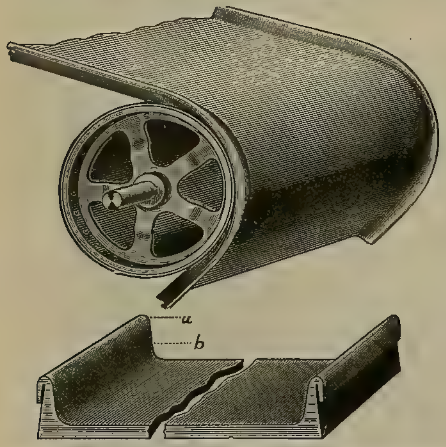
THE BROWNELL "PATENT LIP" FLANGE FRUE VANNER BELTS.



It has taken years of ceaseless testing and experimenting to produce the superior belt which we now offer, with elastic flanges and pliable body reinforced with specially woven duck. Every belt is manufactured by experienced workmen, and carefully tested on machines especially built for that purpose; consequently we are to-day manufacturing the best belts that mechanical ingenuity, combined with honesty of construction, can possibly produce.

SUPT. OFFICE WILDMAN GOLD MINING COMPANY,
SUTTER CREEK, AMADOR CO., CAL., Feb 22, 1897.

MR. JAS. S. BROWNELL, 132 Market St., San Francisco, Cal.—DEAR SIR: Replying to your favor of the 18th inst., will say that in the two mills operated by this company we have nineteen of your Patent Lip flange concentrator belts in use; some of them have been in constant use for the past two years and have given entire satisfaction. I know of no better flange for a side shake machine.

Yours truly, JOHN ROSS JR., Superintdenent.

MEXICAN MILL. EMPIRE, NEV., March 28, 1897.

MR. J. S. BROWNELL, San Francisco, Cal.—DEAR SIR: For some years we have used three different styles of belts on our Frue vanner at the Mexican mill, and for smooth working and endurance the Brownell Patent Lip flange belt has proved its superiority over all others, and I unhesitatingly recommend it to all who are using Frue machines.

Yours truly, EUGENE MAY, Foreman.

MINING AND SCIENTIFIC PRESS.
AND PACIFIC ELECTRICAL REVIEW.

No. 2099.—VOLUME LXXXI. Number 15. SAN FRANCISCO, SATURDAY, OCTOBER 13, 1900. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

How This Paper Grows.

The accompanying illustration graphically portrays the growth of this paper. In the picture is seen on the left the volume for the last half of 1894, which contained 416 pages. In the middle is the volume for the last half of 1896, which consisted of 540 pages. On the right is portrayed the volume of the paper for the last half of 1899, which contained 772 pages. The present volume, for the last half of 1900, will be still larger. This shows the growth in the size of the paper. There is even greater proportionate growth in the number of its readers. It would take considerable space to show this; but that fact is well understood by the advertisers. Of course, the better the paper the more readers, and the more readers the more advertisers. The circulation of this paper is among men who not only can afford to pay for it, but who can also afford to buy what they see advertised therein, and that is the kind of circulation that pleases readers and advertisers, as it insures a publication of value to all. In its latest noted reference to this paper the American Newspaper Directory, through Printer's Ink, said:

> Among the engineering and mining papers in California, none has credit for so large a regular issue as is accorded to the Mining and Scientific Press, published weekly at San Francisco. In fact, it fully equals five times the combined issue accredited to all the others. In all the States of the Far West and the Pacific Slope, consisting of California, Oregon, Washington, Idaho, Montana, Wyoming, Colorado, New Mexico, Arizona and Utah, the largest circulation credited to any publication devoted to engineering and mining is accorded to the Mining and Scientific Press.

The above, from the highest authority on the subject, was, of course, pleasant to know. That was said some considerable time ago. Doubtless were similar reference made now the comparison would be even more flattering to this paper.

Formation of Lode Matter.

In the issue of the 22nd ult. it was stated on page 339 that "sulphide of mercury may be found at Sulphur Bank, Colusa Co., Cal., where also may be seen in decomposed volcanic rocks fissures from which issue steam and hot alkaline water, the sulphur springs depositing siliceous sinter which contains cinnabar and sometimes gold, as do Steamboat Springs, Nevada, where can be seen ore deposits in process of formation." In the issue of Feb. 17, 1900, it was stated on page 175: "The origin of ore deposits and mode of deposition can be conveniently observed at Steamboat Springs, Nevada, where clouds of steam issue from many vents, over a bare rocky space half a mile long, in a narrow valley lined by volcanic ridges on each side. The vents are separated, but occur in parallel lines, showing that they are connected by fissures, filled with opaline quartz. The fissures traverse a continuous crust of deposited quartz, some open, some partly filled with quartz, water issuing from a narrow middle crevice. Some are wholly filled with quartz and have become true quartz-fissure veins. Some of these larger fissures are half a mile long, a foot wide, open and parallel, about 25 feet apart, and, descending downward to the bottom of the quartz crust 30 feet, can be followed no farther because they have deposited quartz in such abundance as to cover up their original vents in the underlying rock. Water does not issue from all the fissures, but can be seen and heard 8 or 10 feet below in violent agitation rom steam and carbonic acid gas. The quartz filling these fissures in the hottest parts is gelatinous, in others spongy and in others hard, or in layers of agate, chalcedony or sugar quartz. Everywhere there is the same distinct ribbon or banded structure, resulting from successive layers of quartz being laid on the sides of the fissure by watery solutions. The quartz in these fissures contains sulphides of iron, copper, cinnabar and even free gold. The metallic contents, as in old fissure veins, are in much less proportion than the quartz veinstone."

These statements have given rise to considerable inquiry and discussion. The brief facts were stated. Some interesting theories as to the formation of lode matter are formulated.

The solution of such questions is an interesting study. Many theories as regards their formation have been advanced since geology has been recognized as a science. Werner's theory, the descension theory, explains the formation of lode matter through infiltration of water holding the metals in solutions from higher situated rocks. It offers, however, no explanation as to where the metallic content of the water is derived from. The descension theory may still be recognized in cases where is found an ore deposit in caverns, and where the presence of the metals above can be proved with certainty.

HOW THIS PAPER GROWS.

Two are often discussed: the ascension and lateral-secretion theory. The ascension theory supposes, in all cases, the lode matter to be brought from a greater depth into the fissures, either by ascending mineral springs or by sublimation. The material found in the lode must be therefore different from that found in the country rock, and must only occur there in the form of impregnation on the sides of the lodes.

There are many ascending acidic mineral springs which contain, besides sulphates, organic matter, and deposit no sulphides in the fissures. The formation of sulphides could only take place by gradual reduction of the sulphate with a larger amount of organic matter than is at present in the spring. Such springs never have been, and never will be, the medium of the lode formation. Many springs, acidic and thermic, issue from fissures in a lode, and are therefore taken as the means by which the lode has been formed. This, however, is not correct, for if it were the case one would find newly formed ore on the walls of these fissures.

Ascending mineral springs, coming from lodes, no matter of what temperature, should not be regarded as the means of bringing the ore into the fissure. They use the lodes, just as any other fissure, simply as the shortest way to the surface, where they deposit the substances, leached out of the rocks, as ochre.

There is, however, another class of mineral springs, and especially thermal springs, of high temperature, which precipitate, besides silver and sulphur, smaller argentiferous or iron pyrites, and even native gold; these springs are found in California and Nevada, and two of them were referred to as above. They are of interest to the practical man, as in some of them one may observe the formation of mineral veins at the present time. The cinnabar deposits of California are of different character, and should not be discussed as a whole, but in groups. For instance, in the Rattlesnake mine, Sonoma Co., Cal., is found mercury, together with liquid petroleum, similar to the deposits of Idria, as an impregnation on clay. In other places, again, it occurs as an impregnation on sandstone. More frequently cinnabar, together with selenium mercury, forms deposits of the stock work or lode form, which, as a rule, are not of large dimensions, but which sometimes, as in Lake Co., Cal., are of some length and thickness. All important deposits are ordinarily accompanied by quartz, sometimes also by opal and brannite, as in the Redington, Cal., mine.

The country rock is serpentine. Of course, only after petrographical and chemical examination can one say what is meant by "serpentine" in this case. It has often been proved that not only have different rocks been mistaken for serpentine, but also that serpentine is not a primitive rock, but a product of metamorphosis of olivine, pilirite, gabbro, and hornblende rocks. To obtain knowledge of the connection existing between the cinnabar deposits and the serpentine rock, one has not only to examine the petrographical and chemical state of the so-called serpentine, but also that of the rocks from which it has been derived. The same will be the case with the sedimentary rocks in contact with the serpentine.

Few of the Californian quicksilver deposits contain native sulphur. They are not interspersed in siliceous sinter, but form compact masses. In their exterior appearances they offer no signs of having been formed by ascending springs, although from some of them carbonic acid and hot water issue from fissures. In the vicinity of Sulphur Bank, Cal., is an extinct volcano, 4500 feet high, whose slopes are covered by trachyte and obsidian. It is surrounded on all sides by hot springs, 72° C., which exhale carbonic acid and sulphuretted hydrogen, and which precipitate borax, siliceous sinter, and sulphur in large quantities. Especially the hills on the southeast shores, which consist of tufa and trachyte, have obtained the name of "Sulphur Bank," as large deposits of sulphur are found on them. Phillips found here decomposed volcanic rocks, from whose fissures the above-named gases, also steam and hot alkaline waters, issue. Sulphur is found everywhere, and contains commonly a little sulphide of mercury. The walls of the fissures are sometimes covered with a layer of amorphous silica, below

which is a layer of chalcedony, and lastly one of crystalline quartz. These siliceous layers contain frequently iron pyrites, and quantities of cinnabar, or they appear to be covered with drops of a hydrocarbon. The places richest in ores are found to be those where the rocks have been most decomposed by the gases, and where they have been changed into a clay with an acid reaction, and containing sulphur. According to this the mercury is first found in the deeper regions of the decomposed tufa, where it gradually changes into a sandy conglomerate of iron pyrites, quartz, clay and cinnabar. The sulphur springs in Colusa county also deposit siliceous sinter, which contains cinnabar, and sometimes gold, as do Steamboat Springs. The deposits of silica on the walls of the fissures show a regular structure of layers, ore deposits in the course of formation, deposits of a singular kind, and which only can be compared to the small metallic deposits from solfataras and fumaroles and from gas exhalation from the surface of lava streams, all of which exhale sulphuretted hydrogen.

There are probably no other ore deposits which carry such an amount of native sulphur, and especially in lode matrix which is composed of silica, and nowhere in the country a clay with an acid reaction. A comparison with the true solfataras is here complete, for these only exhale vapor, but no siliceous alkaline water. On no other volcano has cinnabar been observed in considerable quantity as a product of solfataras or fumaroles. The product of fumaroles consists, as a rule, of different bodies. The fumarole products of the Vesuvius, which contain copper, cobalt and lead, have their origin in the olivines and augites of the lava, which contains these metals as silicates, and which have been decomposed by acid vapors; the trachyte of Sulphur Bank may also contain silicates carrying mercury. This is a question of interest, as mercury has been found in the decomposed trachyte rocks of Hungary, Toscano and Peru; small quantities are also found in ore lodes of propylite in Schemnitz and Kremnitz, Germany. But even then the presence of the hydrocarbons in the siliceous sinter deposits is yet unexplained, nor is there any explanation for the cinnabar-carrying sinter of Steamboat Springs, which have basalt instead of trachyte. It may be that the mercury ores and the gold and silver of these springs have their origin in older lodes, or in sedimentary rocks impregnated with these ores, which have been dissolved by the water and a second time deposited in the sinter. This process would be similar to that in ascending mineral springs which issue from lodes, and which deposit the dissolved metals as ochre. It is remarkable that the sinter springs only deposit such metals as are present in the older ore deposits of California and Nevada, and also that they are accompanied by hydrocarbons, which are never observed in siliceous sinter, but which seem to be very frequent in these older ore deposits of California, and whose origin may be the sedimentary rocks leached out by the geysers. Sulphide of mercury is easily soluble in alkaline sulphides and in sulphide of barium, as it forms with these distinct compounds (RS HgS+5 aqu.), and this at a temperature of 45° C., which is considerably lower than that of the Sulphur Bank, 72°, which goes to explain the leaching out of these older mercury deposits by such waters. The solubility of sulphide of gold in alkaline sulphides is also to be noted. Solutions which contain, besides alkaline carbonates, also alkaline sulphides, deposit first, on cooling, by former dissolved silica, and undergo then, by contact with the air, an oxidation to a thiosulphate, which further is decomposed into native sulphur and a sulphate. The large quantity of native sulphur of Sulphur Bank is the result of the decomposition of the thiosulphate and of the oxidation of the sulphuretted hydrogen. The above-mentioned double sulphide of mercury and an alkali also contributes, for it is decomposed into an alkaline sulphate, sulphur and mercury sulphide. The sulphide of gold, dissolved in sodic sulphide, and deposited by the spring, is decomposed by the air into native gold and sulphuric acid. This, at least, is believed to be the way in which the siliceous sinter and ore deposits of the Sulphur Bank and similar localities in California and Nevada are formed, so long as it has been found that the trachyte of the Sulphur Bank and the basalt of the Steamboat Springs contain mercury in the form of primitive silicates.

A Mining Decision.

In San Francisco this week the U. S. Circuit Court of Appeals discovered and passed on a kink in the extralateral endless chain of U. S. mining law, so expensive to litigants, so full of promise to mining lawyers. The law has only been in operation twenty-eight years, and it is expected that before 2000 A. D. is reached two or three other little points will be made clear.

The case noted was brought up over the famous old Tom Cruse mine, the Drum Lummon of Montana. The St. Louis M. & M. Co. sued an alien corporation, the Montana M. Co., Ltd., alleging trespass on the part of the defendant and claiming damages. The Montana court awarded damages to plaintiff in the sum of $33,000. The plaintiff considered the sum insufficient and appealed for a new trial.

The Court of Appeals on the 8th inst., in an order of affirmance, says:

> The question under present consideration is when a secondary or incidental vein crosses a common side line between two mining locations at an angle, and the apex of the vein is of such width that it is for a given distance partly within one claim and partly the other, to whom does such portion of the vein belong? This question does not appear to have been ever directly passed upon by the courts. A mining claim can have but two end lines, and, having been once established, they become the end lines for all veins found within the surface boundaries. This court has already determined that the line E. C. D. shown in the diagram introduced on the trial is a side line common to the two claims, and, therefore, it cannot be considered the end line of the Drum Lummon vein. If, then, in construction of law the vein in the 25 feet in controversy must be either upon the one location or the other, and if the senior location has priority of title, it would follow that the right of lateral pursuit would remain with the senior locator within a plane parallel to the end line of the senior claim and up to the point of departure of the apex; or, in this case, the front wall. Inasmuch as neither statute nor authority permits a division of the crossing portion of the vein, and the weight of authority favors the senior locator, the entire vein must be considered as apexing under the senior location until it has wholly passed beyond its side line.

It is a travesty on human intelligence that such a jumble of mystifying, expensive and vexatious "legislation" as the U. S. mining "law" should be allowed to continue. One of the principal reasons that so many practical miners sniff at "science" as applied to mining is because all this ridiculous jumble about apex and apices and extralateral rights was put in the mining law by "scientists." The miners themselves never had anything to do with putting this mass of absurdity into the working statutes that govern their affairs, and instinctively reject the hindrance.

The surprising thing is that public opinion permits the continuance of such a law. In its relations to modern mining, it is about the same as if an up-to-date mine with a double-compartment shaft 2700 feet deep should put up with a hand windlass for its entire hoisting facilities.

Mine Consolidation.

A Colorado correspondent thinks that the tendency to consolidation in gold mining in that State and elsewhere is "a menace and an injury to our free institutions." He also thinks that they are "opposed to the best interests of miners." His statements are unaccompanied by argument and are mere assertions, not backed by anything beyond expression of personal belief. Without attempting to discuss the bearing of the question on our institutions, free or otherwise, but looking at the matter solely from what might be styled the mining business point of view, this paper sees nothing to add of relative value to what it has already said on this subject—namely, that the natural tendency of the times is to make the machine do all it can in actual mine work and to elevate the man to make him more capable of directing such work. A part of that tendency is to concentrate and centralize.

In the case of adjoining mining properties, each one with an entire nineteenth century system of operation, separate plant, distinct administration, etc., the twentieth century tendency is to have one large organization operate and administer the entire property as a whole—that is, if the ore now costs $2.30 a ton to treat at one mine and $2.15 at an adjoining one, if the owners of both mines can come together on the same proposition to enable them to treat all the ore of both properties for $1.95 per ton, they figure they can make some money. In this, as in everything else, the tendency of all legitimate mining trends toward economy of production and operation, just the same as in the case of the department store or the large manufactory. The plan in its operation would tend toward the development of other mining properties adjoining, unprofitable under the present system, but of possible profit if worked under more favorable conditions by a consolidated management, which, by reason of its magnitude and scope of operations, could work the present unprofitable property for much less cost than were it prospected and developed as an independent proposition; and if anything were found worth further exploitation, it could be produced at a proportionately greater profit by reason of the fact that it was being worked by a company having other profitable properties adjoining; which is only another way of saying that combined capital can make possible what to an individual would be impossible.

THERE are risks in mining investments as in any other form of investment. It is, however, the business of the intelligent investor who understands his business to see that those risks are reduced to the minimum. But as against the risks common to all commercial ventures may be set the fact that the mining investment is relieved of many onerous elements of risks attendant on mercantile investments. Buying goods to sell again, notwithstanding competition, taking chances on bad debts, are things that do not concern the mine operator but are among the hundred attendant risks that must be taken by the merchant.

THE practical man makes the best theorist, for his theories prove more feasible, being predicated on substantial bases. Theory usually precedes practice, and yet the practice of theory is most satisfactory and effective in the case of the practical men whose theories amount to something. Nearly every successful machine or device in mining or other work is an example of practical application of mechanics and design to theoretical ideas and discoveries.

TO READERS of the article by Prof. A. S. Cooper, California's State Mineralogist, on petroleum, on pages 437 and 438, will doubtless occur the thought that California petroleum in the variety of its possible by-products may be made worth even more by refining and distillation than for fuel. Its great economic value is manifest.

Concentrates.

TWENTY pounds steam should develop 1¼ H. P. per hour.

ONLY mineral oils are used in vessels of the United States navy.

A CHIMNEY 100 feet high has 10-: 8.66=1.154 times the capacity of one 75 feet high.

THE United States offers no bounty or reward for the discovery or production of any metal.

THIS paper is the most widely read and quoted of any weekly mining journal in the United States.

AN idle mine is often an opportunity for a little nerve, knowledge and money to make a profit.

A 54-INCH circular saw, running 800 revolutions per minute, without cutting, would require 1.35 H. P.

QUICKSILVER is produced in two places in British territory—Savonas, B. C., and Jamieson, Victoria, Australia.

THE chief objection to the extraction of gold by the bromine process seems to be the high price of that solvent.

THE Denver branch pays 63⅞ cents per fine ounce of silver contained in gold bars, equal to 57 cents per standard ounce.

ONE of the longest railroad tunnels in California is the San Bernardino tunnel, 7000 feet, tile-drained on each side the track.

WHERE no demand is proven, a note payable on demand bears interest only from the date of the commencement of the suit.

TO DRIVE a triple discharge 2-stamp mill, 5 H. P. ought to be sufficient where the stamps weigh 850 pounds each; if 1000-pound stamps, it would take about 7 H. P.

AT Sisquoc, Cal., an electrically operated dredger digs asphalt. The current is supplied by an overhead trolley line. A large searchlight illumines the asphalt mine at night.

NIAGARA FALLS, N. Y., is now regularly supplying the equivalent of 50,000 H. P. to various manufacturing establishments at a cost to the latter of about $750,000 per annum.

THE largest coke plant in the world is at the Standard Shaft mine, Mt. Pleasant, Pa. There are 908 coke ovens; the daily consumption of coal is 3000 tons; daily coke output, 125 carloads.

A UNITED STATES PATENT to a mining location can be successfully attacked only by a direct proceeding on the part of a United States court on the charge of fraudulent procurement.

GLASS, such as is used for window panes, is produced by the fusion at a very high temperature of purified white sand, lime, sulphate of soda, arsenic, manganese, salt cake and "cullet," or broken glass.

W. C. DAY of Swarthmore College, near Philadelphia, claims to have succeeded in producing from herrings and sawdust a substance precisely similar in appearance, composition and attributes to Utah gilsonite.

A DAY'S WORK put into the necessaries of life will produce more than it would twenty-five years ago; but a day's work saved and turned into capital will now only earn half what it would twenty-five years ago.

OTHER things being equal, gold ore carrying five ounces of silver per ton would probably yield better commercial results with the cyanide process than by chlorination, the silver being lost in the latter process.

AT the time of cessation of work at the Rand, South African gold mines, the consumption of dynamite was about 250,000 cases of fifty pounds each per annum; the price of dynamite No. 1 was about 75 shillings ($18.25) per case.

A MAN can vote at the coming election only at his place of residence. A man who emigrated to the United States as a minor and is now otherwise suitably qualified, has a right to vote at the next election if his father had become naturalized.

THERE are two La Belle mines—one is in Taos Co., N. M.; it is developed by a 700-foot tunnel; the main vein, 4 feet in width, carries low-grade sulphides. The other La Belle mine is in Nevada Co., Cal., with a ledge of fair ore and a mill on the property.

THE recent advance in the price of bleaching powder is due to a combination by the principal European producers. In Europe that is a trade combine; in this country it would be a "trust." In Lancashire, England, the price has advanced to $34 per ton.

IN Riverside county, Cal., water at the present time for irrigation is sold at 75 cents an inch—that is, the amount that would run out of an inch pipe in twenty-four hours under ordinary pressure, say, four pounds to the inch. This is estimated to be 12,960 gallons.

In the United States purchase of bullion all quotations as to price per ounce are made for pure or fine gold and silver; in Great Britain all quotations per ounce are made, not for the pure metal, but for metal at the British mint standard of purity: this with them is 925 fine for silver and 916⅔ fine for gold.

THE term "horse power" applied to a steam boiler is only relative and is designed to convey the idea of the horse power of an engine which a boiler of certain size can supply with steam. The evaporative power of a boiler is determined as follows: Multiply the area of the grate in square feet by the weight of coal burned per hour on square foot, and by 8.2, the product will be the evaporation in pounds per hour.

EVERY representative body of metal miners in convention in the last four years have resolved in favor of revision of the American mining law, and such proposed revision has been variously drafted, but so far none other than tentative effort has been made to secure legislation thereon.

THE meeting of the American Institute of Mining Engineers in San Francisco was in September, 1899; the next after that was in Washington, D. C., February, 1900; the latest in eastern Canada, last August. The next one will be in Richmond, Va., and the next one after that will be in the City of Mexico.

UTAH miners say there is more profit in operating a silver-lead mine now with silver at 63⅞ cents than when it was 90 cents an ounce. Improved and cheaper methods, economic processes, reduced expenses, better transportation facilities, improved machinery, utilization of all mine products, are among the stated causes.

IT has been held (Lockhart vs. Wills, 50 Pac. Rep., 318) that abandonment can not be charged against the locator of a mining claim if, while he is in possession, and before the expiration of the time within which he may perfect his location under the laws of the United States, the claim is seized by another, who holds possession adversely to him.

SEVENTY-FIVE PER CENT of the circulation at Nome and other Alaskan points is in Canadian currency; in the Klondike American bills are at a premium. J. N. Garner, special agent Treasury Department, says: "In Nome I found that about 75% of the money in circulation was Canadian money. About 15% only was American and 10% gold dust."

THE American Smelting Co. in its first year is credited with having smelted at its various plants about 1,500,000 tons of ore: it used 600,000 tons of fuel and 400,000 tons of flux: the output of the refineries was 1,200,000 ounces of gold, 40,500,000 ounces of silver, 160,000 tons of lead; total value, about $64,000,000, of which gold constituted nearly $25,000,000.

"WE need No. —, Vol. —, to complete our file of the MINING AND SCIENTIFIC PRESS," is the daily statement from some quarter. Thousands through the years file and bind their volumes of this paper, advertisements and all. A concern advertising herein that expects to be in existence ten years from now has reasonable assurance of having its business announcement referred to during that entire period.

BARIUM OXIDE at 700° C. takes up an atom of oxygen from the air to form barium dioxide. This second atom is given off at 1000° C., leaving the barium oxide. In the commercial method of preparing oxygen by means of this agent, it is heated to 750° C., under increased pressure. The air is then withdrawn by means of a force pump, causing the atom of oxygen to be given up. This process is repeated until required amount of oxygen is obtained.

ANYONE holding a United States patent to mineral land need do no further work upon it, nor is there any further tax or expenditure so far as the federal government is concerned. But a patented claim, like any other real estate, is liable to local taxation. Sometimes such local taxation is more than the $100 annual development work would be, and the likelihood of such taxation has been a fruitful cause of delay in completing title to mining property.

TO MEN working where they are liable to be "leaded," whether in mine or smelter, barley water is recommended as a corrective. It should be used right along. A good antidote for lead poisoning is dilute sulphuric acid. A drop in a glass of water should afford relief. The ordinary case of lead poisoning is inhalation of the oxide of lead, and the sulphuric acid in the water drank immediately converts it into a sulphate of lead that passes out of the system.

A READY method for determining the amount of asphaltum present in bituminous rocks is afforded by digesting the powdered rock with carbon bisulphide, the asphaltum being thus completely dissolved out. As oil shales and coal were found when treated in this way to contain no asphaltum, the carbonaceous matter being of animal and vegetable origin, it is concluded by some that true asphaltum is of deep-seated origin, and results from mineral reactions such as the double decomposition of water and metallic carbides.

THE Mount Bischoff mine, in the northwest of Tasmania, is, perhaps, one of the most remarkable tin deposits in the world. The average grade of the ore is 3%. The concentrates average about 70% tin, yielding an average of 68% in smelting. The crushing and dressing expenses amount to about 1s 3d per ton of ore treated. This is considered the greatest tin paying mine in the world. The Mount Bischoff plant is a combination of sluicing and ore dressing appliances befitting its mixed alluvial and lode character, consisting of a mill with seventy-five stamps, Spitzluten and Spitzkasten, jigs and round tables.

TO DETERMINE silver in gold bullion by volumetric assay, one-half gramme of the alloy may be melted in a porcelain crucible over a burner or in the muffle, five grammes of cyanide of potassium having been previously placed in the crucible. When fused, two and one-half grammes cadmium are to be added, and after perfect alloying with the bullion the crucible is cooled and the cyanide dissolved in water. The clear button is then put into a dissolving bottle and 25 c.c. nitric acid of 32° added. When the cadmium and silver dissolve the silver may be determined by sulpho-cyanide, or NaCl solution, after sufficient pure silver is added to make the entire quantity present about 1.004 milligramme. Such amount of pure silver added is to be deducted in final determination of the silver contained in the bullion.

WHEN diluting sulphuric acid with water the acid should be poured slowly and carefully into the water, while the mixture is constantly stirred. If the water be poured into the acid, the heat produced where the water and acid contact may occasion spattering. What is called "marsh-gas," "fire-damp," etc., is a methane. It is found in nature in petroleum, which gives it off when the pressure of the earth is removed. It is of constant presence in coal mines. It is a carbon dioxide, and when mixed with air explodes if a flame or spark comes in contact with it, being a constant cause of coal mine explosions. The scientific article sent is mistaken, as carbon is the principal component of this deadly gas.

QUESTIONS normally difficult to accurately answer are sometimes rendered still more difficult by the lack of detail in the question or the possibility of latitude in the surroundings. An example of such latter style of query is afforded in the simultaneous inquiry from Lillooet, B. C., and Silverton, Colo., desiring "Concentrates" to say: "Would gold which passed through a 60-mesh screen be visible to the naked eye? At what mesh would gold be in such a fine state of division as to be almost invisible?" Off-hand, one might say in answer to the first question "Yes." In answer to the second, "100." But, manifestly, there are conditions that would make such answers only approximately correct. Some men have better eyesight than others; what might be invisible to one man might be distinctly visible to another. A Trinity county, Cal., miner says he can see gold that has passed through a 120-mesh screen. A Tooele county, Utah, miner says it is hardly possible to make a mesh so fine as to render the gold passing through it invisible. Individual conditions have much to do with these things. Gold too fine to be ordinarily visible in the pan would become prominently visible with a background of ebony, or black tile, as used by some miners. The question, of course, hinges on the idea conveyed by the elastic term "visible."

THE Ashcroft process has been repeatedly described and illustrated at great length in this and other technical journals. Its most extensive use has been in treatment of the refractory lead-zinc ores of the Broken Hill mine, New South Wales. This ore contains 30% each of lead and zinc as sulphides, and 25 to 30 ounces silver per ton, the sulphides being so intimately mixed as to render separation by concentrating machinery commercially impossible. The ore is ground and roasted, then leached in suitable vats with a solution containing per. salts of iron and salts of zinc. The iron is precipitated as ferric hydrate by the action of the zinc oxide of the ore, while the latter passes into solution as sulphate of chloride. The iron remains partly in the leaching vats with the lead and silver and partly separates on heating the effluent. The residue is smelted for the two latter metals in the usual manner. The solution from the leaching vats, which must be quite free from iron, is then passed through two sets of cathode chambers, and one-third of its contents of zinc is obtained as metal deposit on the cathodes. It is now passed through the two sets of anode chambers of the same depositing vats, in the first of which iron anodes and in the second of which carbon anodes are employed. Solution of the anode with formation of ferrous sulphate occurs in the former series, and oxidation of this to the ferric state in the latter. The effluent from the double series of vats is then ready for use again in the leaching vats.

WHERE a person or company has or may run a tunnel for the purpose of developing a lode or lodes owned by said person or company, the money so expended in said tunnel shall be taken and considered as expended on said lode or lodes, and such person or company shall not be required to perform work on the surface of said lode or lodes in order to hold the same. The annual labor of $100 on each claim may be performed under the above section by work done on a tunnel, cutting, or which is driven to cut, such claims. The patent expenditures of $500 may also be made in such tunnel. A party may patent one lode on the line of his tunnel for each $500 of labor spent in driving the tunnel. There is no provision of law for patenting a tunnel site. But it may maintain an adverse claim for the protection of its line and tunnel rights. Every tunnel, whether a crosscut or run upon a vein, is presumed to be for the development of lode claims, and in each case its rights are very closely defined by law. If the proper notice has been posted on the site, establishing the boundary lines thereof, stakes set, etc., and the record only made, the work must be prosecuted with reasonable diligence; the land office rules that "a reasonable diligence in prosecuting the work is one of the essential conditions of the implied contract. Negligence or want of due diligence will be construed as working a forfeiture of their right to all undiscovered veins on the line of the tunnel." A tunnel may, like any other kind of claim, be abandoned; but neglect to work does not effect an abandonment; such neglect only operates to deprive it of tunnel rights along its line.

Machine Mine Rock Drills on the Pacific Coast.

Written for the MINING AND SCIENTIFIC PRESS
by A. E. CHODZKO.

Rock drills have come nowadays into such general use that no mine claiming to have passed the prospecting stage would be considered in working order without them; and while hand drilling is still and probably will always be the only practicable method under special circumstances, machine work is more and more used for tunneling, for drifting, for sinking and for stoping.

In this country, as in Europe, where mechanical rock drilling originated in 1856 at the Mont Cenis tunnel, it was from the start applied on a large scale to railroad work; and one would hardly recognize in the trim little stoping drill of to-day a kin of the huge and clumsy machines of yore, mounted on their ponderous carriages.

And yet these obsolete tools have marked such a decided improvement in the time-honored methods prevailing at that time that the wonderful developments of low-grade mining during the last third of this century may be directly traced to the introduction of machine drilling.

A description of all the varieties of rock drills, either of the reciprocating or of the rotary class, in this country and abroad, would furnish ample material for a good size treatise, a large portion of which should be devoted to American machines.

Less ambitious is the scope of this paper, and the writer will limit his attention to the rock drills obtainable to-day in San Francisco.

Electric drills, much advertised in other parts of the country, are not likely, at least in the near future, to supplant the compressed air machines for underground work on the Pacific slope; at any rate, they do not seem to have made dangerous inroads into the field occupied by the latter.

It is not intended to take up the comparative arguments set forth in favor of either. The fact is that at the present date air drills are practically in exclusive use on this coast, and it is thought that a short description of these machines might prove interesting to the mining reader, the more so as a majority of them are of home manufacture, and have been designed and improved with special knowledge of and regard for local requirements.

When a machine of this class is put on the market it is an almost invariable custom to introduce it by sending a number of specimens on trial to various mines, where the new drill generally works side by side with other machines in regular use at the place. Not only has it to withstand the same rough usage as its older competitors, but, besides, it must make its way to prominence against the natural prejudice of men disturbed from their familiar work, to learn how to handle the newcomer to best advantage.

It is not going too far to call it an unwelcome guest with the miner, however favorably inclined the owners of the mine may be, and the builder may safely expect a tendency to emphasize the defects of his machine rather than to overlook them.

After a while the drill is returned to its maker, if not a complete wreck, at least more or less bruised, and charged with an imposing array of shortcomings, which will have to be made good before it is granted the favor of another trial.

Not uncommonly will these modifications amount to an entire remodeling of the primitive design, and the ordeal is repeated, till finally the ambitious drill comes out victorious on a last trial, which simply means that it is now fit for practical use, a privilege which it is sharing with a number of others.

Nor is now the drill maker entitled to what he might consider as a well-earned rest. Competition will hereafter require his constant watchfulness to outdo every progress heralded by a rival builder. and while a well-known firm is always solicitous, even at a distance. for the successful operation of its machines, yet there is no questioning the fact that the local manufacturer is more directly interested in perfecting his own, not only as a purely commercial matter, but also on the ground of professional prominence among customers with whom he frequently comes in personal contact.

Of the several rock drills sold in San Francisco, some are made in the East and others are manufactured in that city. All belong to the reciprocating class.

In describing the construction of these machines, from information furnished by the dealers and manufacturers at the writer's request, the latter proposes, for obvious reasons, to abstain from any expression of personal opinion as to the comparative merits of the various features involved in their design.

There is no implied desire to advertise any particular make. It is simply intended to point out the fact that this region is fully up to date in the matter of rock drilling machinery.

The first machines to appear on the Pacific coast were the old style Burleigh, brought here by Messrs. Parke & Lacy about 1871. These were succeeded by the Ingersoll tappet drill, brought out in 1876 and 1877 by John B. Reynolds of Reynolds, Rix & Co. Then came the Ingersoll Eclipse, brought out by Reynolds, Rix & Co., soon followed by the Richmann, the first rock drill of local manufacture (W. T. Garratt & Co.), which went out of use after a few years of existence.

Next came the National, brought out by Reynolds & Rix. This drill and the Ingersoll Eclipse were the standard machines on this coast for a number of years, till the National was replaced by the Phœnix drill, built in this city by Rix & Firth, and one of the first representatives of the auxiliary valve system. The Sergeant drill next made its appearance, brought out by H. P. Gregory & Co.

Then came the Cummings drill, a machine of local make, operated on the two-pipe system.

The Challenge drill, brought out from England, made only a passing stay on this coast.

The Rand drill was next brought out by H. D. Morris & Co., and with the Leyner, manufactured in Denver and brought out by E. P. Allis & Co., and the Sullivan, made in Chicago and brought out by Henshaw, Bulkley & Co., represent the latest types of imported drills on this market.

The Doble drill, the Firth, the two Giant tappet drills of the Rand type, one manufactured by the Compressed Air Machinery Co. and the other by the Rix Engineering & Supply Co., are all machines of local make, and close up the list at the date of this writing.

The machine rock drills, whose particulars have been furnished to the writer, and which will now be briefly described, are:

Eastern made machines: Ingersoll, Sergeant, Sullivan, Rand; Leyner, of Colorado.

California manufactured machines: Rix Giant, Compressed Air Co.'s Giant, Firth, Cummings.

All these machines are especially intended for underground work, quarrying on a large scale being only exceptional on this coast. The same machines, moreover, can be used for open air work, although certain types of Eastern manufacture are more particularly recommended in those cases.

A comparison between the various designs will be made more easy and more practical by a few remarks concerning the salient features of the operation of a rock drill.

Any machine whatever, designed for that purpose, reproduces the movements of the hand driller, namely:

First.—A sharp-edged steel drill or bit is projected against the rock, by the rapid reciprocation of a piston, to which it is firmly attached, and which moves into a cylinder. Compressed air is admitted into and exhausted from that cylinder by a valve which controls the reciprocating motion of the piston.

The first distinctive feature of a rock drill is therefore its valve motion.

In the early types of European machines built for the Mont Cenis and the St. Gothard tunnels a special motor was used to operate the valve; it was simply a double-acting piston engine, actuating a shaft upon which a cam was mounted, connected with the valve of the drill, which could, therefore, be operated independently of the piston, and, namely, if the bit became engaged in the hole. This system has long since been discarded and was never used in American machines, where the motion of the valve is always controlled by the reciprocation of the piston itself; and this control is effected in either one of three distinct ways, all of which can be found in existing and successful machines.

(a) In the tappet drills the valve is moved back and forth over the ports by an oscillating lever or tappet, whose position is reversed when the piston comes in contact with it at the ends of its stroke. This is the most positive connection that can be devised. It is characteristic of the Rand drill and of the two types of Giant drills previously mentioned.

(b) In this second variety the valve is cylindrical and self moving, when air is admitted or exhausted in proper time behind its ends, which act, therefore, as pistons moving in separate chambers at both ends of the valve chest. The admission and exhaust of air into and from these chambers takes place through posts or passages whose ends are alternately covered and uncovered by the piston of the drill. The best known representative of this system is the Ingersoll Eclipse, and among the above mentioned drills it is characteristic of the New Ingersoll, of the Cummings and of the Sullivan.

(c) Another device consists, as previously, in controlling the admission and exhaust of air on both ends of a cylindrical valve; but here the two ports used for that purpose are open to pressure or to exhaust by an additional or auxiliary valve, positively actuated by the main piston. This system partakes, therefore, of the two former ones.

Amongst the machines here considered, the Sergeant and the Firth are provided with this style of valve gear.

As to the relative value of the three systems, it would probably prove useless to draw well defined lines, besides stating that the Eclipse device (b) is possibly less subject to wear than the two others; all of them have been for a long time and are still applied in many thousands of successful and efficient machines. The last two are used simultaneously by a prominent Eastern firm, while other builders, after successfully making rock drills with auxiliary valves, have now adopted the tappet system. So that a selection between them seems to be a matter of custom or of individual preference more than anything else.

Second.—If the drill were always beating against the rock in the same position, it would soon become engaged and wedged into the pieces of broken stone detached from the bottom of the hole. It is, therefore, necessary to drill a round hole, and this is effected by turning the piston and the attached drill by a certain amount at each blow, so that the cutting edge of the drill never strikes the same spot twice in succession. This partial twist generally occurs on the back stroke, although in some cases it has been effected on the forward stroke. This motion also facilitates the cleaning of the hole of broken fragments, and in all of the above-mentioned machines it is invariably produced by a rifle bar, which engages a nut fastened at the back end of the hollow piston of the drill, and which is provided at its back end with a ratchet and pawl device, allowing the rifled bar to turn in one direction, but locking it in the opposite one.

The only variants in that rotating mechanism consist in that with some machines, namely, the Rix Giant, the Ingersoll and the Sergeant, the pawls are carried by the back head of the rifle bar, and the ratchet teeth are cut into the ratchet box or casing; whereas in the other machines the teeth are cut around the head of the rifle bar, and the pawls are inserted in the ratchet box. (Compressed Air Co.'s Giant, Cummings, Firth.) The rotary device of the Sullivan drill consists of rollers locking the rounded ratchet teeth when turning in one direction.

Third.—As the hole becomes deeper, it is necessary to move the cylinder forward, to prevent the piston from striking the front head.

In early machines for tunnel work, and in modern types more particularly designed for surface work, means were provided for producing this motion automatically. In homogeneous and hard ground, and when a number of drills are working together, this automatic feed is desirable and simplifies the attendance.

Experience has shown, however, that in most cases of practice, and, namely, for underground work, hand feed is preferable, and this is exclusively adopted in the machines presently considered. The only variant is found in the feed nut, which is single in all of them, except in the Rix Giant, where a double nut is used, permitting by a relative motion of the two nuts to take up the wear of the threads.

It appears, therefore, that in most cases a rock drill can be characterized in a few words, respecting its three essential functions, namely:

Valve Motion: Tappet, Eclipse or auxilliary valve.

Rotary Device: Stationary or revolving pawls or friction rollers.

Feed: Automatic or hand. Single or double nut.

The shell carrying the cylinder side guides and the feed nut is attached to a column, with or without arm, or to a tripod. Carriages are found only in tunnel work and not in ordinary mining.

Special features of the shells will be pointed out in describing each machine. So will the clamp, through which the shell is fastened to the column or to the tripod.

No reference will be made to columns or arms, which are of practically uniform design in all cases.

Tripods will not be represented either, as with very few exceptions they pertain to surface rather than to underground work, and their description would extend the scope of this paper without necessity.

(TO BE CONTINUED.)

By-Products of Coke Production.

Considerable inquiry has been received regarding the by-products of coke production. In addition to what has been published, the most practical statement noted of late is contained in an account received from the New England Gas & Coke Co. of Everett, Mass.:

"At Everett (a suburb of Boston) the New England Gas & Coke Co. sell their sulphate of ammonia at 2½ cents per pound, and get about thirty pounds from a ton of Cape Breton coal in the process of coking. Assuming that only twenty-eight pounds of sulphate of ammonia will be obtained at Sydney, and that the selling price will be only 1¾ cents instead of 2½ cents per pound, it will yield 49 cents per ton of coal. The by-product ovens at Everett also obtain from a ton of Cape Breton coal about twelve and one-half gallons of tar, which is sold at 2 cents per gallon, and about 5000 cubic feet of gas, which is sold at 20 cents per thousand. At Sydney the surplus gas will be used in the steel mill, and it is fair to estimate its value at the cost of natural gas in the most prolific natural gas districts of the United States, or 5 cents per 1000 feet. This will give the steel mill as cheap fuel as if it were located in a natural gas district. It is calculated that the quantity of gas produced at Sydney will be somewhat less than at Everett, as the coke will be treated somewhat differently to suit the blast furnaces, but it will not be less than 3000 feet, which at 5 cents per 1000 feet will be 15 cents per ton of coal. The quantity of tar obtained will be about ten gallons per ton of coal, which at 1 cent per gallon, half the price obtained in Boston, would give 10 cents per ton of coal. Thus the value of the ammonia, gas and tar obtained from each ton of coal will be not less than 74 cents, while the cost of manufacturing the coke and by-products will only be about 10 cents."

Electric Mine Hoists.

The use of electricity in mining has reached an advanced stage of development in Cripple Creek district, Colo., where the miner may eat a meal warmed by electricity, in a room lit by electricity, ride in an electric car to the mine, go down in a cage run by an electric motor, talk through an electric telephone between the stations, put in a blast by use of an electric drill and touch it off by electric device, and subsequently see some of the ore electrolytically reduced.

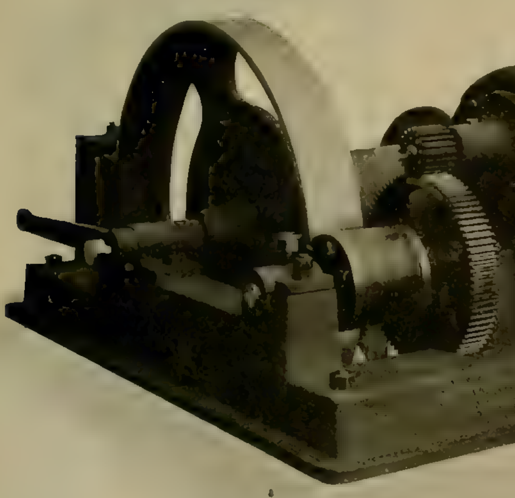

Fig. 1.—Electric Winze Hoist.

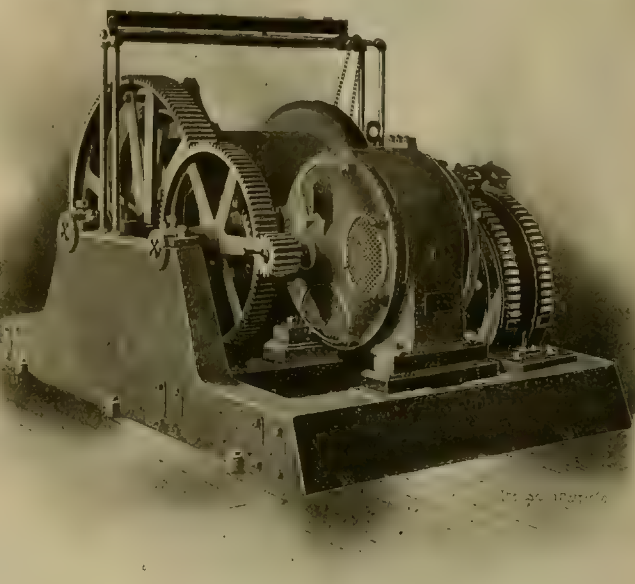

Fig. 3.—Electric Hoist "Cripple Creek Standard."

Not alone in Colorado but in other mining States is electricity in daily use in great variety of form, both for surface and underground work; but in the district specified conditions conduce to make it noticeable.

In the matter of electric hoists, especially, Cripple Creek affords example of progressive types. Figs. 1 and 2 depict a style of hoist considered to be well adapted for use in stopes and winzes. They are furnished by the Denver Engineering Works Co., Denver, Colo., in 1, 2 and 3 H. P. As will be noted, they may be operated by direct or alternating current motors. The drum is driven by a flat paper friction wheel and the hoisting, lowering and braking are controlled by one lever, which throws the drum either against the revolving friction wheel or against the stationary brake block, while the motor runs continuously. The hoist frame is cast in one solid piece. The drum is of cast iron with 6-inch flanges. All gears are machine-cut from the solid. The motor pinion is cut from vulcanized fiber, or rawhide. The hoists are furnished with sheet iron housing if desired; size of drum, 10″ diameter, 15″ long; size of steel rope, ¼″; shipping weight of hoist, without motor, 815 pounds. The capacity of 3 H. P. hoist with direct current motor is as follows: 1600 revolutions per minute; rope speed, 150 feet per minute; load, 600 pounds.

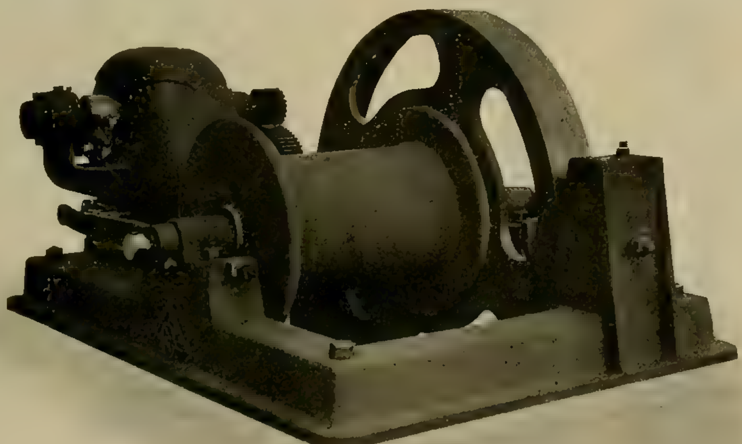

Fig. 2.—Electric Winze Hoist.

The same concern also make what they style the "Cripple Creek Standard," shown in Fig. 3. This hoist is not especially designed to be operated by an induction motor, but may be equipped with a railway motor. The brake is of the band type; the gears of close-grained cast iron, machine cut; the shafts are of steel, running in babbitted bearings; the drum has removable bronze bushings; the motor pinions are of vulcanized fiber, or rawhide. The motor is set on hard wood blocks, making complete insulation between the motor and hoist. The controller for varying the speed of the motor is of the street-car type, adapted to the alternating current. The reversing and speed control is effected by the one handle of the controller. In the 15 H. P. hoist the frame is cast in one piece; the 30 H. P. hoist is made with solid frame, or with frame made in sections and bolted together; the 50 and 75 H. P. hoists are made with sectional frames. The shipping weight of a 15 H. P. hoist of this type, without motor, is 2600 pounds; load, 2000 pounds; size of rope, ⅝-inch.

Deep Mining in California.

On the occasion of the August, 1900, meeting of the American Institute of Mining Engineers at Halifax, Nova Scotia, as reported in the Canadian Mining Review, in discussing a paper by G. W. Stuart of Truro, on gold mining in that province, R. W. Raymond said: The indications which Mr. Stuart has given of a revival of gold mining in this province and to a greater depth is parallel with what has been occurring in California, where, with energy and modern appliances, they are treating rock that was formerly thrown away. I remember a couple of years ago enquiring as to the cost of mining and milling in California, and I found they were able to extract ore from the hard quartz vein 2509 feet from the surface, and take it up to the surface and treat concentrates for about $2.60 per ton, of which $1.25 went for mining.

Following, Mr. Gilpin said: The gold mining industry of Nova Scotia has in the past consisted almost entirely of operations in the small gold-bearing veins. Many of these small veins were not suitable for small local syndicates, because it was found that after $150,000 or $200,000 had been taken out the pay streak ceased, but there have been veins of moderate size which have been worked very profitably by companies for a long time. I think the best results are to be looked for in the low-grade belts. They are undoubtedly the most certain, and it is along these lines, I think, that the greatest development is to be made. Our mining facilities are very good. Of course, we cannot prospect in winter, because the ground is frozen, but all our mining is carried on in winter as in the summer.

Mr. Raymond: Has the recent glacial denudation taken place before or after the completion of the veins?

Mr. Gilpin: After.

Mr. Raymond: Then in that case you began the work in this province for 1000 feet below the original surface when the range was formed?

Mr. Gilpin: Yes, but as a matter of fact, we have mines that have been opened on the entire thickness forming the gold-bearing horizon.

Mr. Raymond: How deep have your high exposures been worked? And what is the aggregate height above the sea that the gold veins are exposed?

Mr. Gilpin: Mount Uniacke is about 600 feet above the sea, and veins have been worked there to a depth of 350 feet.

Mr. Raymond: I only wish to bring out this point to emphasize what Vancotta said. It is absurd to talk about veins giving out when they were originally 5000 or 6000 feet higher than they are to-day. You start 5000 or 6000 feet below and then you wonder whether it is going to give out. Eor instance, in California, the mother lode runs with it, and it is crossed by innumerable canyons. We run across the vein on the top of the mountain, and then across the same vein 1000 feet farther down. The veins in the canyon were poor and on the high mountains rich, and that made prospectors feel that they gave out. It is only within the last few years that we have found bedrock at a depth of 1000 feet, and now they mine at a depth of 5000 feet.

Mr. Edwards: In California the experience of our miners had been that after going down 500 or 600 feet there did occur a barren zone and that continued 400 or 600 feet farther down, and when that barren zone was reached the men of the mine ceased work. But latterly they have tried it again and they have struck pay ore still farther down and that is what they are working on now, and as far I know they have not reached the bottom of that pay zone yet. They have reached down some 2000 feet, and they have 1200 feet of continuous pay ore in depth.

Mr. Raymond: In older times when they went to $5 a ton they could not work it at such a depth.

Mr. Edwards: They can take it out from $2 to $3 a ton.

Mr. Raymond: I suppose they take out $3 stuff rather than none.

Mr. Edwards: There was one man out our way who only got 69 cents for years and years and still they worked it.

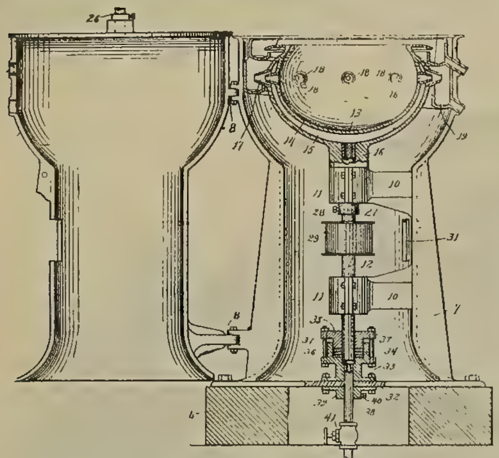
Jas. Douglas, the president of the American Institute, in the course of some further remarks at Waverly, said: Last year we visited the mother lode in California. There we saw the marvelous ore deposit which in the early days enriched California, and which had fallen into decadence, mines closed and everything gone to wreck and ruin, the mother lode supposed to have been exhausted. But better machinery, more skill and higher metallurgical science was brought to bear upon it, and the prosperity of the mother lode was never more assured than it is to-day.

Mining and Metallurgical Patents.

Patents Issued October 2, 1900.

Specially Reported for the MINING AND SCIENTIFIC PRESS.

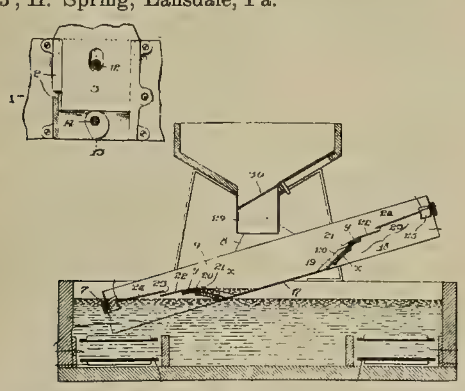
MECHANISM FOR SIZING AND SEGREGATING ORES OR DISINTEGRATED MATERIALS.—No. 658,807; C. E. Seymour, H. S. Morey, Placerville, Cal.



Mechanism for sizing and segregating ores of finely divided or disintegrated materials; combination, with revoluble treatment vessel adapted to act by centrifugal force on material contained therein, provided with discharging outlet, adapted to discharge to exterior of vessel, conduit having connection with external discharge of treatment vessel, adapted to serve as passage for opposing force conducted under continuous pressure through discharge into receptacle and simultaneously through discharge outwardly, by which construction energy under pressure exerts inward and outward pressure at point of external discharge, inwardly acting portion adapted to drive back lighter particles, while permitting heavier particles to be forced against and through it by centrifugal force to effect discharge of heavier particles at point of external discharge, facilitated by outwardly acting portion of agent, and external fluid forcing device connected to or communicating with conduit.

◆

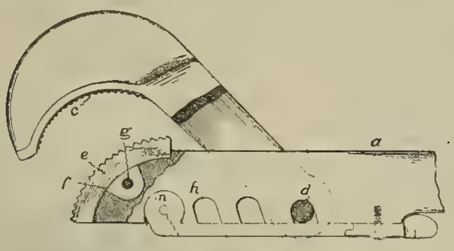
WASHER AND CONCENTRATOR FOR ORES.—No. 658,813; H. Spring, Lansdale, Pa.



Scoop or pan adapted to be suspended in or above body of water and dipped endwise thereinto, comprising side walls, bottom section, inclined end sections, latter provided with overflow openings and valved inlets, including each metallic portion, 19, blanket portion 20, with riffle 21, metallic portion 22, and dip 24; combination water tank, of cradle suspended therein, scoop in cradle provided with oppositely inclined ends having overflow openings and valved inlets, and means for oscillating cradle whereby inlets are dipped into and raised from water in tank in alternate succession.

◆

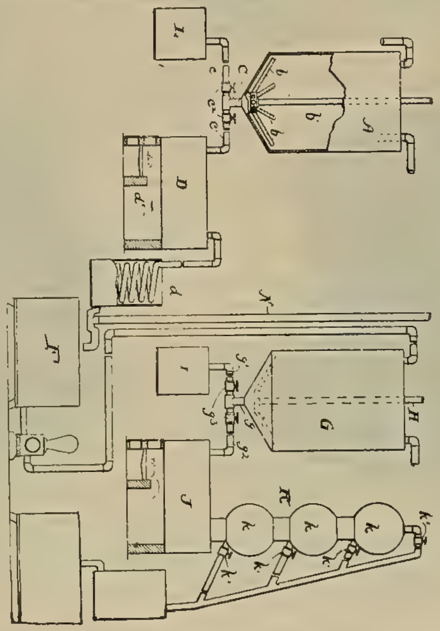
PIPE WRENCH.—No. 658,962; T. E. Ryan, San Francisco, Cal.



In a wrench of character described, combination with movable jaw, and solid shank having handle portion at one end gripping jaw at other end, quadrant-shaped face on jaw-bearing end, detachable jaw fitted thereto, having serrated outer face and smooth inner face of same curvature as face on end of shank and on which jaw has solid bearing for entire extent of surface, mortise in middle of bearing surface on end of shank, fixed tongue on curved inner face of jaw standing perpendicularly thereto and taking into mortise, crosspin inserted through shank and tongue and holding curved faces in positive contact, latch bar having ears of circular shape on one end standing perpendicularly from one side of bar, and recesses of corresponding shape in opposite sides of shank in which ears are let in flush with sides of shank fitted to turn, hinge pin inserted through ears, latch adapted to lock free end of bar, constructed for operation.

◆

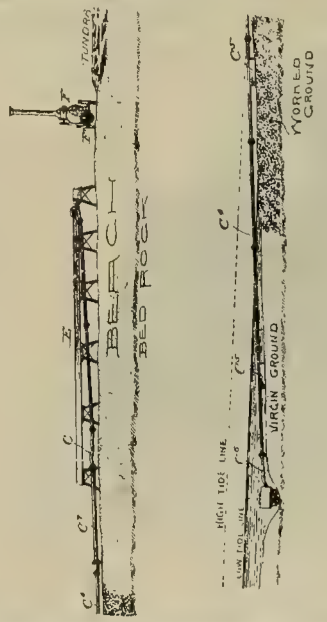
PROCESS OF DESULPHURIZING PETROLEUM OIL.—No. 658,857; J. McGowan, Cleveland, Ohio.



Process of desulphurizing sulphurized petroleum oil, which consists in distilling mixture of sulphuric acid with sulphurized oil which has not been previously treated so as to change chemical character of sulphur compounds therein, agitating sulphuric acid with oil; allowing mixture to settle; segregating oil from precipitated sludge and so much of acid as settles with it; finally distilling sulphurized oil with so much of acid as remains mixed with it.

◆

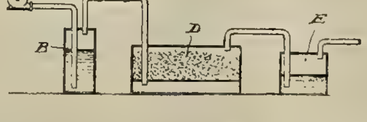
SUBMARINE DREDGER.—No. 658,922; G. A. Overstrom, Deer Lodge, Mont.



Submarine dredger, combination of float device formed with airtight compartment having water inlet and outlet valves, compressed air supplier communicating with compartment operating to let water in or force it out of compartment, to increase or diminish displacement of float, suction and force pump and operating motor therefor on float device, and delivery pipe extending from pump to shore.

◆

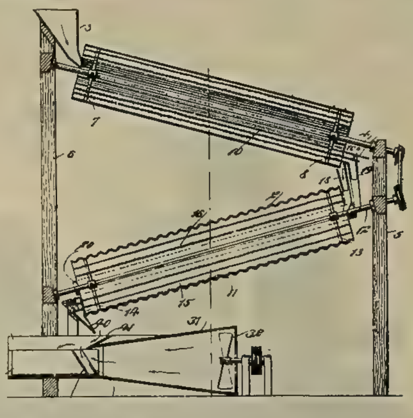
PROCESS OF EXTRACTING GOLD AND SILVER FROM ORES.—No. 658,938; J. B. De Alzugaray, London, England.



Process for extracting precious metals from their ores, consisting in moistening crushed ore to such an extent that it will "ball" in the hand, with concentrated solution of cyanide, placing moistened ore in gastight vessel, subjecting same to action of gaseous mixture of bromine and oxygen, whereby precious metals are converted into soluble salts of same, obtaining precious metals in solution by washing ore, and finally recovering metals from solution in any suitable manner.

◆

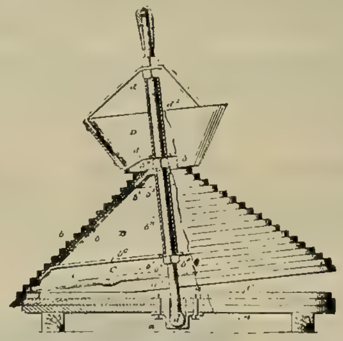
GOLD SEPARATOR.—No. 659,148; Hopkins & Manzke, Spirit Lake, Iowa.



Gold separator, comprising two rotary cylinders inclined in opposite directions one above the other, upper cylinder having two cylindrical screens spaced apart of different mesh, having gravel screen consisting of longitudinally placed bars, two cylindrical screens in lower cylinder spaced apart, different mesh, chute for feeding material from upper cylinder to interior screen of lower cylinder, rotary pipe arranged at one side of lower cylinder, chute for discharging material from screen in upper cylinder into pipe receptacle for receiving material discharged from lower cylinder and from pipe, an air-blast device for operating material passing into receptacle.

◆

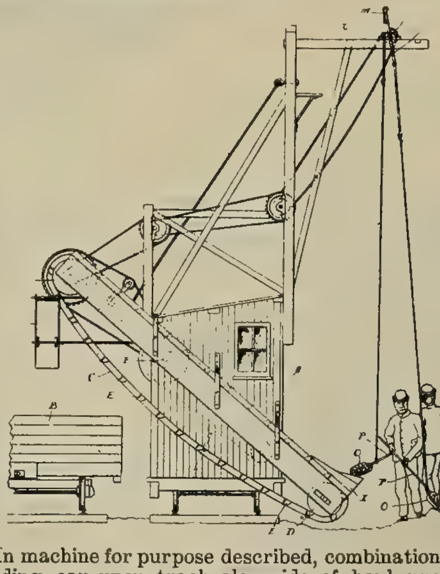
ORE SEPARATOR.—No. 658,947; W. J. Goyne, Barton Heights, Va.



Ore separator comprising base or platform, annular track secured thereto, threaded shaft having lower enlarged portion loosely mounted in base or platform, cone-shaped separator body mounted on shaft, nuts working on shaft and engaging separator body, hopper also mounted on shaft, nuts working on shaft and engaging hopper, series of concentric annular rings or flanges secured to upper face of separator body, annular ring secured to lower face arranged to contact with track ring having series of undulations or corrugations.

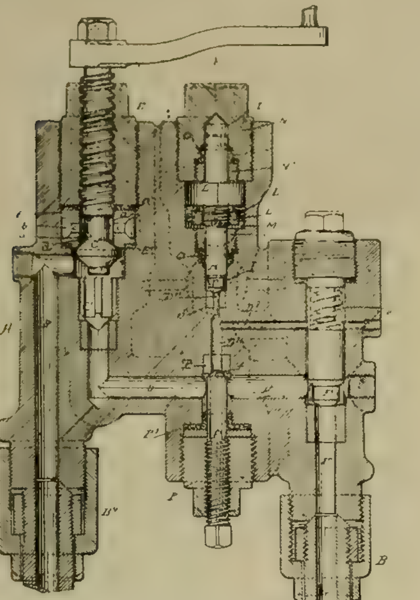
◆

MACHINE FOR EXCAVATING, CONVEYING AND LOADING BALLAST UPON RAILWAY CARS.—No. 659,008; A. Torrey, Detroit, Mich.



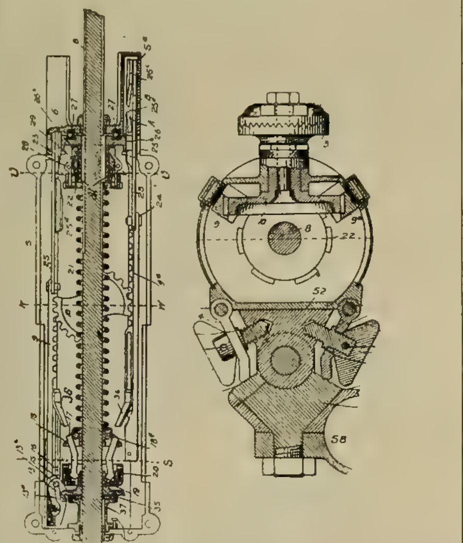
In machine for purpose described, combination with loading car upon track alongside of bank provided with two inclined conveyers operated from source of power on car, adapted to receive material from hoppers on side of car adjacent to bank near ground, to convey it directly into ballast car standing on other side of loading car, crank shaft having oppositely extending cranks at each end, cranks at one end placed at right angles to cranks at other end, overhead frame supporting shaft on loading car at distance above hoppers and overhanging same, length of cranks, actuating connection with source of power for imparting continuous rotary motion to crank shaft, suspension devices from crank shaft and track shovels, connected at handles to suspension devices adapted to be manually operated with mechanical assistance of power derived from motion of crank shaft.

HYDRAULIC VALVE.—No. 659,031; H. W. Kimes, Dayton, Ohio; assignor to the Stilwell-Bierce & Smith-Vaile Company, same place.



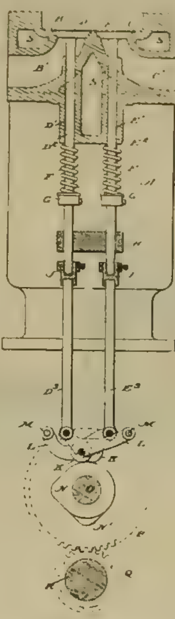
In valve mechanism for hydraulic rams, combination with low and high-pressure valves, of main passage communicated with by both valves, check valve interposed between main passage and passage leading to press cylinder, communication between press cylinder and high-pressure valve, whereby high-pressure valve is opened when pressure in press cylinder attains predetermined stage, passage D″ forming direct communication between high-pressure valve and main passage, passage forming direct communication between passage D″ and low-pressure valve, and throttling device interposed in main passage between passage D″ and low-pressure valve, whereby accumulation of high pressure between low-pressure valve and throttling device is prevented, high pressure is enabled to act upon low-pressure valve instantaneously with pressure from high-pressure valve to passage D″.

ROCK DRILL.—No. 659,185; A. M. Southard, Denver, Colo.



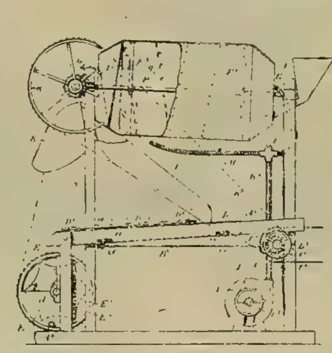
Rock drill, combination with reciprocating shaft and power spring surrounding shaft, of collar surrounding shaft, shoes located in collar engaging shaft, gripping levers engaging shoes, another collar engaging levers against which power spring presses, normally causing levers to grip shoes, clamp releasing mechanism comprising two connected jaws one being pivoted on casing, other adapted to slide on pivoted jaw, lever having arm passing through slots formed in two jaws, one slot having angular and straight portion, other slot being shorter, whereby lever arm moves through angular portion of one slot, two jaws are forced inwardly to engage two collars, after which lever arm forces jaw containing short slot rearwardly thrusting collar against spring, thereby releasing shaft from action of gripping levers.

GAS ENGINE.—No. 658,858; L. H. Nash, South Norwalk, Conn.



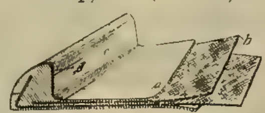
A plurality of poppet valves having parallel stems, rocking arms respectively pivoted to stems at one end and to fixed bearings at other, rocking arms overlapping one another, and cams by means of which said rocking arms and valve stems are operated.

ORE SEPARATOR.—No. 658,921; J. B. Moore, Oakland, Cal.



Combination of rotary separator which eliminates coarse impurities, chute or runway leading finer pulp from discharge end of separator, concentrating table receiving fine pulp from chute, series of transversely moving agitators working across upper surface of concentrator, maintaining suspension of finer material while permitting grain gold to settle, trough arranged below concentrating table, drum working therein, series of amalgamating plates secured to drum operating to intercept float gold escaping from concentrating table.

BELT FOR ORE CONCENTRATORS.—No. 11,860; W. J. Loring, Angel's Camp, Cal. (Reissue).



Concentrator belt consisting of body portion having yieldable edge flanges, reinforced by textile material cut on bias, of alternating layers of rubber and textile material having solid rubber edge flange, one layer of textile material extended sidewise and embedded in flange.

PROFESSOR F. W. PUTNAM of Harvard University, a leading American anthropologist, is traveling through California, and says there are better hopes of solving the antiquity of man in California than anywhere else in this country. The California gold-bearing gravels in which the Calaveras skull, the Table Mountain bones and a number of stone implements are said to have been found, date from an antiquity far more remote than any other known formation which contains relics of men. An accurate scientific demonstration that human bones or implements really occur in the auriferous gravels will immensely increase the known antiquity of man. Any miner or excavator who can show to a scientist, in place in the auriferous gravel, such remains, will make a discovery of high importance. In the California University museum are a number of stone implements whose finders have made affidavit that they actually came from the auriferous gravels, deep under lava flows, and among the bones of extinct animals. Of fifty-eight distinct Indian languages known in the United States, thirty are native to California, which makes this State an unrivaled place for investigation in aboriginal linguistics. Meanwhile, this paper long since showed that the Calaveras "prehistoric" skull was a myth.

Source and Origin of Values.

Increase of ore values with depth is always a mooted question among miners. That ore bodies increase both in size and value with depth is a dictum held by many mining engineers, among whom are Wm. A. Farish. In a report on a Cripple Creek, Colo., property he gives his reasons for such belief and among other things, says:

"The values came from great depth in hot water solution under great pressure, the heat being generated by the dikes, and as the waters cooled off the values were precipitated in the rocks and crevices. These waters carried sulphuric acid which acted upon and destroyed the feldspar and mica, replacing them by silica, thus changing a pure granite into what is locally called 'granite quartz,' carrying values.

"Where the formation is solid and has not been disturbed, continuous ore bodies are generally found of varying lengths and widths in the veins, the ore-bearing gangue being granite quartz and pure quartz.

"Where the formation has been disturbed, the waters not being confined to a regular crevice or conduit have dissipated their weath in the surrounding formation.

"This whole district was at one time—prior to the dike era—covered by overflow porphyry, and at present that portion of the district lying north for a distance of about 2½ miles and an equal distance of east and west of the center of the north and south line is in porphyry bounded on all sides by granite walls, showing that there is a basin in the granite filled by porphyry cut by the dikes of the district, as above referred to. It is my opinion that some point within the porphyry area an extinct volcanic crater will yet be discovered. All the overflow porphyry in the district, except in the basin referred to, was scoured off by glacial action, and the granite rocks from the surface down to several hundred feet in depth were more or less moved and disturbed, which is the reason that no great bodies of continuous ore (except in rare instances) have been found above 300 to 500 feet in depth, the wealth carried in the water being dissipated in the loose and broken formation.

"By the above I do not mean to infer that no valuable ore was found above the depth indicated, for there was a great deal of money taken out of the veins which have been developed above 300 feet; but the ore bodies, as a rule, were narrow and short, and oftentimes did not continue in depth, while below that depth the ore bodies have been more continuous, longer, and as a rule of greater width and of more uniform value.

"Reasoning from the above-known facts, it is my opinion that as depth is attained, the quality of ore will increase, and at the same time maintain its present average values. By this I do not mean to say that at different depths in any mine values will not fluctuate, but I do mean to say the general average quantity of ore will increase and values will be maintained until great depth is attained.

"It is therefore my opinion that the veins will carry values as long as the formation is cool enough to permit of the waters precipitating their values."

Big Railroad Tunnel.

The Great Northern Railway tunnel, in the heart of the Cascade mountains, is through. By Dec. 1 track will be laid and trains running. Work began in January, 1897. It is 13,253 feet long and cost about $4,000,000. It is 53 feet over 2½ miles in length. There were approximately 800 men employed for nearly three years. They cut the tunnel from both ends at once; the progress through the solid rock averaged about 8 feet for every working day for each gang of workmen. It therefore required fifty men one working day to cut 1 foot of the tunnel. It is 23 feet high, 16 feet wide; the entire interior is lined with cement. The rocks that were blasted were ground into powder and mixed with the cement. The steam locomotives will not pass through the bore; an electric engine will pull the trains from one end to the other. This is made necessary on account of the coal smoke from the locomotive. The tunnel was designed and built under the supervision of J. F. Stevens. The difference in alignment was about one-fourth of an inch; the error in the grade was 2½ inches.

THE greatest quantity of iron ore mined in any country in one year, up to 1899, was 19.4 million long tons, the output of the United States in 1898. This figure, however, has been eclipsed by the record of 1899, made up and announced by the Geological Survey. In 1899, according to that authority, our production of iron ore reached the total of 24,683,173 long tons—an increase of 27% over the record mark of the previous year. The total value at the mines of the ore was $35,000,000, or $1.42 per long ton. The average value in 1898 was $1.14.

Working an Asbestos Mine.

At Thetford, near Sherbrooke, Ontario, Canada, are the largest producing mines of high grade asbestos in the world.

The mining is carried on in open quarries, what is known as "the big pit" at Bell's mine being several acres in area and about 150 feet deep. The serpentine is drilled and blasted and is conveyed to the surface by cableways and derricks. The first task is the separation of the asbestos-bearing rock from the barren rock, and this is done by hand picking. The portions containing asbestos are then conveyed to the cobbing house, where old men and boys knock off the long-fibered asbestos from the serpentine. Generally, cobbing is limited to veins from ⅜-inch thick upward, the separation of the asbestos carried by the thinner veins being done mechanically.

The mechanical separating process is a simple one. From the cobbing room the rock is deposited in chutes leading to a battery of rock breakers below. At Bell's mines gyratory breakers of the Gates type are employed, and from them the coarser fragments pass to a set of crushing rolls. From these rolls the crushed rock passes on to traveling belt picking tables, where boys standing alongside pick the fragments of barren rock off the belt and throw them to one side. The mineral bearing fragments pass from the picking tables to cyclone pulverizers in which the final crushing is performed and where a current of air separates the light asbestos fiber from the heavier rock dust. At various points between these crushing and picking operations the material is screened, and finally the abestos fiber is screened from the fine dust and finely broken fiber. The operation is a continuous one, the rock passing from the top floor downward through the various processes until the final product—commercial asbestos—is turned out at the ground floor. Except for the work of the boys at the picking tables the operation is a mechanical one throughout.

The separated asbestos is divided into three grades for the market. The first grade comprises the long-fibered material which is separated by cobbing. The two other grades are similarly determined according to length of fiber, color and freedom from foreign matter. The material not good enough to be included in any of the three commercial grades, but which contains fiber, is called "waste" and really constitutes a fourth grade. The sorted asbestos is packed in bags of 100 pounds capacity for the market. At the Thetford mines about two tons of commercial asbestos is obtained from every 100 tons of rock which is crushed. Altogether about 600 men are employed in the mining operations of three companies working the deposits at Thetford.

Progress at the Anaconda.

At the property of the Anaconda Copper M. Co., Montana, each mine has machinery for handling ore from a depth of 3000 feet. The old style hoisting ore with cars is abandoned; ten-ton self-dumping skips have replaced them. The skips are either hung above a double-deck cage or below, to suit the arrangements of the skip bins at the surface. By having cages in connection with these skips, every time the skip makes a trip a load of ore can be hoisted, besides two cars of waste or deck loads of men, and, in consequence, no men need wait for a cage for any length of time. The skips are loaded at the different stations, from fifty-ton ore bins, in a few seconds. The gates are operated by compressed air. The old way of using cars was dangerous for the station tender, in pulling the empty cars off and pushing the loaded ones on the cage, besides being hard work. Now he pulls a lever and the skip is loaded. The sinking of the shaft is done by direct hoisting engines, capable of sinking 1000 feet from one place. The old wooden gallows-frames have been replaced with steel structures from 60 to 100 feet in height. An important consideration in the building of steel gallows-frames, engine houses, etc., was to guard against fire. The steel frames are incombustible and there is no lumber above the shaft.

The company has in most places high-pressure marine boilers. The boiler houses are of steel. All the machinery underground is run by air. All the large underground pumps are furnished with air instead of steam, keeping the mines cool and comfortable. No vacuum pumps are now needed; these were formerly a great expense, on account of the acid water. Most of the pumps are of the Corliss type. The column pipes are wood and lead-lined.

* * *

H. B. **Depoy** of Indianapolis, Ind., has made some experiments with a process on which he has been working for thirty-two years on the manufacture of steel. With the new process, he says, any piece of steel may have its tensile strength increased from 40% to 75%. "It can be made so hard that no tool will scratch it, and only a diamond can be used to cut it. Yet it can not be cracked or broken by impact. The harder the steel is made the greater and more dense its tensile strength becomes." Railroad men say that, if so, Depoy has discovered the very thing that railroads have been searching for in vain for years—a process by which steel rails can be hardened to resist the wear and tear of heavy trains without becoming so brittle as to crack easily.

Of Increasing Use.

The automobile or "locomobile," as it is sometimes styled, is becoming a familiar object in the streets of many principal cities. Like the bicycle, it is evolutionary, and there are constant improvements. Among those noted are the styles furnished by the Locomobile Co., a self-propelling steam-motor vehicle, with little noise and no odor or vibration. The body contains the boiler, engine, gasoline and water tanks. The gasoline is carried in a copper tank under the footboard; it is forced by compressed air through the boiler, where it is vaporized, and thence to the burner, where it is ignited. The steam is generated in an upright copper boiler; water is supplied by a direct-action pump connected to one of the crossheads of the engine. This pump works continuously when the vehicle is in motion. The running gear consists of two steel-trussed ball-bearing axles, connected by a double reach; the front wheels connected to their axles by several joints; the rear axle composed of two parts passing through the rear tubing. Fig. 1 illustrates the "Runabout," Stanhope model; Fig. 2 a different make with buggy-top; Fig. 3 a "Locosurrey."

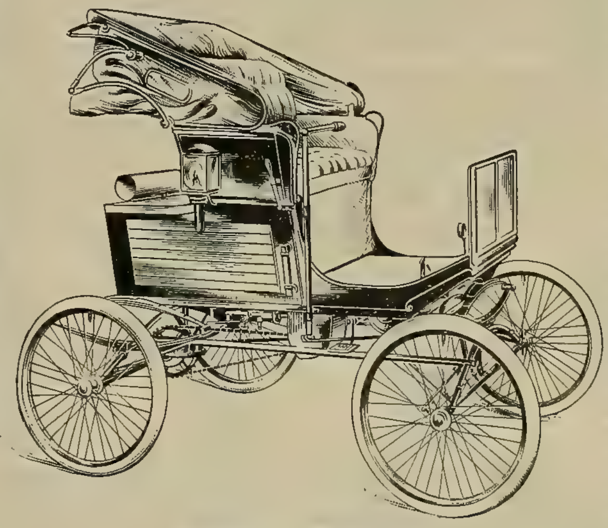

Fig. 2.—Style 3, Victoria Top.

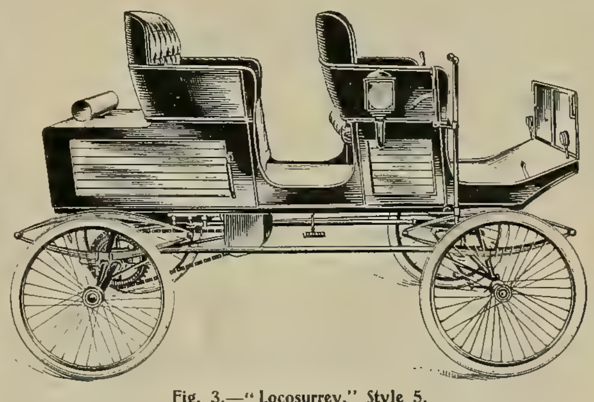

Fig. 3.—"Locosurrey," Style 5.

Explosives—Constant Care Necessary.

In spite of the quantity of explosives used in mining, in spite of the special instructions issued with every packet, in spite of the lessons taught by former accidents, it is a sad truth that injuries from dynamite and its kindred explosives continue to furnish about one-third of the total number of accidents for the year.

Nitro-glycerine and other high explosives are not dangerous so much by themselves and under normal conditions, as from the fact that they have to be exploded by percussion, by means of a detonator containing fulminate of mercury, which is a very sensitive medium. We have, therefore, these rules:

Never keep dynamite in the same box as the detonators.

Never clean a detonator with a hard substance, such as a pin, or even a straw, merely shake the sawdust out.

Never bite the cap on to the fuse, but use a pair of pliers.

When using powder, it is necessary to tamp very tightly, hence copper bars are allowed; iron bars being prohibited, as they emit sparks when struck on the side of the holes. Many miners still cling to the superstition that dynamite must be tamped like powder and, therefore, use a copper bar. This should be prohibited, it is not necessary, and is very dangerous, for if the bar slipped out of the man's hand when pushing the primer home, its falling weight is quite sufficient to explode the detonator. Hardwood sticks are all that are required and all that are permissible.

In all large mines the dynamite stored underground should be placed in a specially constructed magazine, under the charge of one man. The detonators being in separate boxes well apart; and a locked and cased lamp kept constantly burning; any one taking a naked lamp into the magazine should be dismissed, for if dynamite catches fire and burns away instead of exploding, it generates excessive quantities of carbonic acid and carbon monoxide—the one asphyxiates, the other is a deadly blood poison; and it may destroy every man in the level.

Proper cases should be supplied for carrying the dynamite from the magazine to the working places, and contractors' boxes should have a separate compartment for the explosive, the detonators and the fuse, and be provided with a strong hinged lid.

In charging holes underground explosives should never be mixed; it is absolutely useless since the quicker explosive will do the work, and it may be dangerous by setting up chemical reactions and generating deadly gases, which would not be formed in excessive quantities by the one explosive. Never drill out missed holes, never go back to missed charges until some time has elapsed and never drill into old sockets, as a plug may only partially explode, or may coat the hole with a layer of active explosive. Neglect of these simple and obvious rules has erected a city of tombstones over the bodies of the hapless and foolish victims.

When firing holes all approaches to the place should be carefully guarded to prevent any one from inadvertently approaching.

When firing charges there are three methods adopted—by snuffs, by matches, and by spitting the fuse. The most common and most dangerous is to spit the fuse; even the best fuses may have a bad coil; occasionally where the powder is unevenly laid, the fuse will then "run" and explode the charge prematurely. The usual speed of a fuse is 2 feet a minute, but the writer has known an individual coil, by one of the most reliable makers, run through 5 feet in twenty-five seconds; hence spitting is dangerous, as a man has no time to escape should the fuse begin to crackle, a sure sign that it is running.

It is becoming very common to spit a fuse with dynamite. The end of the fuse is split with a knife, and a piece of dynamite the size of a pea placed in this slit; the dynamite is then lighted and ignites the fuse. Some day the dynamite will explode, temporarily or permanently blind the man, and while he is groping about to find his way out the charg will explode and he will pay the full penalty for his temerity.

Firing with a match is done by splitting the end of the fuse, inserting the head of the match and lighting the other end; this gives nearly three-quarters of a minute extra time.

The best plan is to use a candle snuff; each fuse has a snuff placed under it, the miner lights them and can retire to some safe place and wait until the fuse burns through and spits. As soon as he sees they have all spitted he can go away and there is no danger; yet in spite of all this, and for the sake of saving two or three seconds, men will frequently juggle with their lives.

In firing in shafts it should be compulsory to fire with electric discharge. A man never knows what may go wrong with the engine, windlass or ladders—if he lights his fuses and anything should go wrong he is like a rat in a trap, with no escape. In firing by electricity the battery is never connected until all the men are out of the shaft, and there can be no danger; it is also far more efficient.—T. R. Godfrey.

Characteristics of California Petroleum.

By A. S. COOPER, Cal. State Mineralogist.

Petroleum oils from the different oil fields of California differ widely in physical characteristics and chemical composition. They may contain, chemically combined, one, two or three of the following elements, sulphur, oxygen and nitrogen, and in widely varying amounts, while in some rare instances these elements may be absent. Oils in the same stratum and a short distance apart may vary greatly. Frequently a well when it first yields will give an oil of a lighter gravity than that which it will yield when it has been pumped for some time.

We may, therefore, look upon California petroleum oil as containing the following substances in an unknown state or states of combination: Carbon, hydrogen, sulphur, oxygen, nitrogen and other substances in minute quantities; these combinations being very great in number and extremely complex.

The boiling point and melting points of the bitumens are altered very considerably by the presence or even by the traces of sulphur, oxygen and nitrogen. The presence of a greater or less amount of these substances during distillation has an influence on the distillate. Generally the larger the amount of carbon, sulphur, oxygen or nitrogen an oil contains, the greater its specific gravity, boiling and melting points.

California petroleum is a mixture of a large number of hydrocarbons and a large number of compounds containing hydrocarbons, combined with sulphur, oxygen, nitrogen and other elements.

The sulphur compounds usually predominate, followed by oxygen, then nitrogen, and, last, the other elements in smaller quantities. These sulphur, oxygen and nitrogen compounds were formed at the time that the oil was distilled from carbonaceous rocks by the heat of metamorphism, or are substitution compounds formed subsequent to such distillation by the hydrocarbons coming in contact with these substances under different conditions. Oil when exposed to the air absorbs oxygen. When heated with the peroxides the peroxides are reduced to a lower state of oxidation. Petroleum when exposed to sulphur vapors absorbs them; when heated with the persulphides the persulphides are reduced to a lower state of sulphuration. From the above it can be seen that California petroleum is of a highly complex character, containing a large number of hydrocarbons and hydrocarbon derivatives. When the sulphur, oxygen, nitrogen and other elements are removed a number of the remaining hydrocarbons must be unsaturated, and unless these substances be removed from the crude oil before distillation, fractional distillation does not give a true index to the composition of the oil. Ultimate analysis is worthless to show the character of the oil.

All the hydrocarbons and their compounds with other elements in California crude petroleum are volatile. Some, such as benzine, are extremely volatile, whereas asphaltum volatilizes with great slowness. Natural gas is a volatile part of petroleum. Like coal, the bitumens, oil and asphaltum, through decomposition, are constantly giving off carburetted hydrogen.

This decomposition is probably effected by acids, alkalies and other oxidizing agents forming oxygen compounds with the bitumens and liberating carburetted hydrogen.

Decomposition may also be effected by sulphurizing agents forming sulphur compounds with the bitumens and liberating carburetted and sulphuretted hydrogen. These oxidizing and sulphurizing agents are formed by metamorphism and other chemical reaction within the earth, and which came in contact with the bitumens. Carburetted hydrogen may also be generated from oil by heat. This gas is often found issuing from vents in the ground in California, having a temperature higher than the surrounding ground, sometimes as high as 90° F.

One of the reasons that California petroleum oil has such a high gravity is owing to the fact that the formation in which the oils occur is tilted and broken, permitting the escape of the gases. When California petroleum is evaporated by atmospheric influences, the sulphur, oxygen and nitrogen compounds remain and are concentrated, and, if the process is continued long enough, solid asphaltum is formed. After asphaltum is formed evaporation proceeds with exceeding slowness. Heat accelerates evaporation. The evaporation from an oil tank built underground and kept at a temperature of 50° F. is far less than from a tank built above the ground and exposed to the sun's rays, which may often reach a temperature of 130° F.

If a petroleum oil having a specific gravity of 40° B. be exposed to the heat of the sun in a shallow pan it will decrease 20% in volume in a short time; the portion of oil evaporated being better for the manufacture of gas than the part remaining in the pan. This experiment is easily tried and very convincing. Notwithstanding this loss by evaporation caused by high atmospheric temperature, the oil producer stores his oil in dark colored tanks which are exposed to the blistering heat of the sun, and it is to be regretted his example in many instances is followed by the gas manufacturer. If the oil tank cannot be placed underground where the temperature is low and fairly constant, it should at least be shaded from the sun and whitewashed to decrease absorption of heat.

When a fresh supply of oil is emptied into a tank which contains oil which has been stored for some time, it should be introduced into the bottom of the tank. The fresh oil, being lighter than the oil already in the tank, has a tendency to ascend, and in doing so it dissolves the heavy oil and will not evaporate as rapidly as it would if placed on the surface of the heavy oil.

Advantage is taken of the fact that asphaltum is nearly an unalterable gum to make many constructions in which a plastic and unalterable cement is required. Usually California asphaltum contains from 5% to 9% of sulphur.

Some wells in California produce oils containing paraffine, but they are so valuable for producing illuminating oil that their use for gas making is prohibitive.

At Baku, in Russia, a tract of land less than twenty acres in area has produced in twelve years 35,000,000 barrels of oil, and is still producing about 12,000 barrels per day.

On the Laguna extension, or Zaca rancho, in Santa Barbara county, California, there are large deposits of bituminized sand exposed upon the surface. On any one of several twenty-acre tracts at this place the dimensions of the exposures of the bituminized sand would show that it contains 8,000,000 barrels of heavy petroleum of the consistency of molasses.

To make one barrel of that material must have taken eight barrels of ordinary petroleum before evaporation, so that on each twenty-acre tract is now the remains of 64,000,000 barrels of petroleum oil. The astonishing part of this is that it is seen upon the surface and is not hidden beneath. Therefore, in California as well as in Russia, there are probabilities of a very small territory producing immense quantities of petroleum oils. The case cited shows one at least of such places; and there may be, and doubtless are, many others of similar character where the oils are still hidden.

Unaltered rocks of California cover an area of over 40,000 square miles. Bitumens occur in all geological formations, from the plutonic, metamorphic or igneous rocks up to and including the quaternary. It is found saturating strata of sand and seamed shale and as many as ten beds of shale can be seen on the eroded sides of some of the anticlinal ridges of the Coast Range. These sand beds are very irregular as regards their thickness and the distance intervening between them. Some are a few feet in thickness, while others exceed 400 feet, and the shales are from a few feet to over 500 feet in thickness.

When several sands are to be seen on the side of a mountain, or when they can be traced upon the surface of the earth by their outcrop, if bitumenized at all, the bitumen will generally be in the geologically lower beds; and when a sand contains bitumen, the underlying sand beds are also liable to contain bitumen. At the present time nearly all the wells that are being bored are in the vicinity of surface indications—to wit, oil seepages, outcrops of bituminous rock and gas blows, all of which are signs that the reservoirs of petroleum are leaking, owing to insufficient cover. At present the wells are generally shallow, but they will increase in depth in time, as they have done in other oil fields.

The day is not far distant when oil territory will be selected by geologists on account of favorable structure and position, irrespective of surface bitumens. The wells in this territory will have to be drilled to greater depths, but, when productive, will yield light oil. Owing to the large area, and the thickness of the unaltered rocks, the great thickness and the number of the oil sands in California, the yield of oil in California in future years will be enormous.

A comparison of the consumption of fuel oil with that of coal shows 3.33 barrels of fuel oil to be equivalent to one ton of good imported coal. Figuring oil at $1.40 per barrel, and coal at $7.50 per ton in San Francisco, it shows the cost of oil to be $4.66 as against $7.50 for its equivalent in coal. Moreover, the labor required to operate with coal is far greater than with oil, in most instances being nearly double.

The perfect cleanliness of fuel oil and the ease and simplicity of supply and regulation, make it a most desirable substitute for coal. As long as coal remains at $7.50 per ton in California it cannot be expected that oil will fall below its present price, not at least for some time to come.

In the year 1899 there were 1,740,027 tons of coal imported into the State of California; to supplant this 6,794,278 barrels of oil will be required. As the supply becomes more permanent the uses of fuel oil will multiply.

The removal of the gasoline, benzine and illuminating oil leaves an oil with a high flashing point, which would be less dangerous to use in a locomotive and otherwise than a fuel oil of low flashing point. The removal of the water also improves the oil for fuel purposes, as it does not have to be evaporated by the fire.

The asphalts in the crude oil are objectionable for the manufacture of gas. When the asphalts are subjected to the temperature necessary to gasify the oil, sulphurous gases are formed (principally sulphuretted hydrogen), and as the asphalts contain a large percentage of sulphur, these gases are formed in quantity and require a large amount of a purifier for their removal. The presence of asphaltum also fouls the checkerbricks in the superheater and carburetor in making water gas, and the retorts in making oil gas.

At present the market value of asphaltum is too high for it to be economically used for either the manufacture of gas or for fuel purposes. The large percentage of sulphur in natural asphaltums or in those obtained as a residue in the distillation of crude petroleum make them an undesirable fuel. During combustion with oxygen the sulphur combines with the oxygen to form sulphur dioxide. Sulphur dioxide in absorbing water or the vapor of water, changes to sulphurous acid. By oxidation, the sulphurous acid is changed to sulphuric acid, which may lodge on the surface of the boiler and attack the iron, forming sulphate of iron. Through this action the sulphur contained in the asphalt is a cause of corrosion in boilers. Owing to the presence of sulphur, the fuel value of asphaltum is small when compared with the other hydrocarbons contained in crude oils.

The time is not very far distant when crude California oil will not be used for the manufacture of gas. Distillates will be substituted for crude oil for the reasons given in this article. Therefore, it will be of interest to know what action distillation will have upon the crude California oils.

In Pennsylvania the upper half of the still is left exposed to the air to facilitate decomposition. During the first distillation of crude California petroleum oil, decomposition of any part of the oil should be avoided. Consequently, the stills should be completely bricked in so that the vapors will be kept fully heated until they escape to the condenser. In the manner of cracking, as practiced in Pennsylvania, there must be a great loss of heat from the exposed surface of the still.

The laboratory and practice show that the distilling, manipulating and purifying of crude California oil must be totally dissimilar and different from the methods in use in Pennsylvania, Canada and elsewhere. Most of the crude California oils should be distilled twice. From experiments made it would appear that the vapors of the lower hydrocarbons during distillation are contaminated by the decomposition of the sulphur compounds contained in the higher hydrocarbons, such decompositions being caused by heat. Usually the higher the boiling point of a distillate obtained during any one run of a still, the greater the amount of sulphur compounds contained in the same. In distilling oils containing sulphur, the main bodies of the sulphur compounds remain in the higher hydrocarbons. Owing to this action, by repeated distillation, the sulphur compounds are generally eliminated to a great extent, but hardly ever completely, from the oil.

A distillate having a certain specific gravity, when distilled under atmospheric pressure from crude petroleum, may contain sulphur in notable quantity, whereas a distillate of the same specific gravity when distilled from the same crude petroleum oil in vacuo may be comparatively free from sulphur. This is probably owing to the fact that a greater temperature is required to vaporize the oil when under atmospheric pressure than in a vacuo, this additional heat decomposing the sulphur compounds. At ordinary temperatures petroleum oil does not absorb sulphuretted hydrogen when collected on the surface of the oil.

If hydrogen at a high temperature, or in a nascent condition, is introduced into the vapors of the light hydrocarbons during distillation, the sulphur vapors which are formed by the decomposition of the sulphur compounds contained in the lighter hydrocarbons combine with the hydrogen and can be carried from the still; but if the hydrogen is omitted, the sulphur from the decomposition of the sulphur compounds combines with the hydrocarbons to form complex sulphur compounds which are removed with difficulty. It is supposed that, when in a crude state and not distilled, the lower hydrocarbons in the California petroleum do not contain sulphur compounds to any marked extent, but are sulphurized during distillation by the decomposition of the sulphur compounds contained in the higher compounds.

The asphalts obtained by the distillation of California petroleum contain from 4% to 7% of sulphur. Vapors of sulphur have a greater affinity for heated hydrogen, forming sulphuretted hydrogen, than for heated hydrocarbon vapors to form sulphur compounds. When hydrogen is in a nascent condition it will replace sulphur in the liquid compounds of sulphur and hydrocarbon by inverse substitution. The activity of this action is increased by heat. At 60° F. the action is very feeble, but at 200° F. the action is rapid, and at higher heats the action is still more rapid.

As has been stated above, California crude petroleum is composed of a number of hydrocarbons and hydrocarbon compounds, mutually dissolved one within the other, and having different boiling points. Owing to this they can be fractionally distilled so as to separate them into fractions having the following commercial names and physical characteristics:

Crude California Oil, 20° B. Distillates, Commerc'l Name.	Gravity			Per cent Obta'd, Approx.
	Approx. Baume.	Specific Gravity.	Weight of 1 gal. in lbs.	
Gasoline	75	0.6820	5.69	3
Benzine	63	0.7253	6.04	4
Illuminating	45	0.8000	6.66	13
Mineral sperm	38	0.8333	6.94	8
Gas distillate	28	0.8860	7.38	21
Light lubricating	26	0.8974	7.48	8
Neutral	23	0.9150	7.62	10
Heavy lubricating	15	0.9271	7.72	5
Valve lubricating	14	0.9655	8.04	4
Asphalt	..	......	....	11
Loss	..	......	....	13
				100

The following are the percentages of the distillates obtained by the first distillation from many crude California oils:

	Per cent.	
Naphtha	traces	to 15
Illuminating	6	to 27
Gas distillate	16	to 30
Lubricating	20	to 52
Asphalt and loss	7	to 25

In the first distillation the following are the temperatures at which the following distillates are distilled:

Crude naphtha	——	to 150° C.
Illuminating distillate	150°	to 300° C.
Gas distillate	300°	to 350° C.
Lubricating	150°	——

Owing to the highly complex composition and great diversity of California oils the above figures are to be considered only suggestive.

The Theory of Distillation by Steam.—Very many substances which distill only slowly or with decomposition can be quickly distilled and the decomposition averted if a current of steam is passed into the space above the boiling liquid or into the liquid itself. The latter is the better, for it gives a longer surface from which the vapor may come off, and also agitates the liquid so that in case there is any sediment it will not burn fast to the bottom of the still. Crude petroleum may be cited as a substance volatile with steam.

The reason why steam helps distillation may be explained by Dalton's law (the pressure, and consequently the quantity of vapor which saturates a given space, are the same for the same temperature, whether this space contains a gas or vacuum).

Now, as steam carries out from the still the vapor of the boiling petroleum, and allows more vapor to take its place, this explains the increased speed of the distillation by steam.

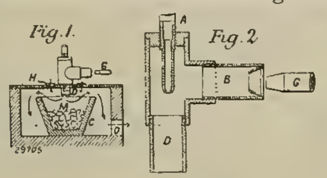
The vapor of the petroleum being removed, the liquid is as free to evaporate as if no steam were present—i. e., as if a vacuum was maintained; but it cannot be said that distillation with steam is the same as distillation in a partial vacuum. It only gives the same result as the latter. The decreased amount of decomposition may be explained by the vapor being quickly removed from contact with the superheated liquid and the sides of the still.

Why would not carbonic acid, hydrogen and other gases do as well as steam? When any of the gases, or their component parts, affect the petroleum it is manifestly inadmissible. For instance, sulphuretted hydrogen would sulphurize the petroleum, and the oxygen of air would oxidize the petroleum. Many gases could be used if they were practically condensible.

The volume of steam used is immense and condenses to water, which occupies $\frac{1}{1698}$ of the volume of the steam. Thus steam may be used to aid in the distillation of the petroleum, which is not soluble in or decomposed by water.

Crucible Furnace.

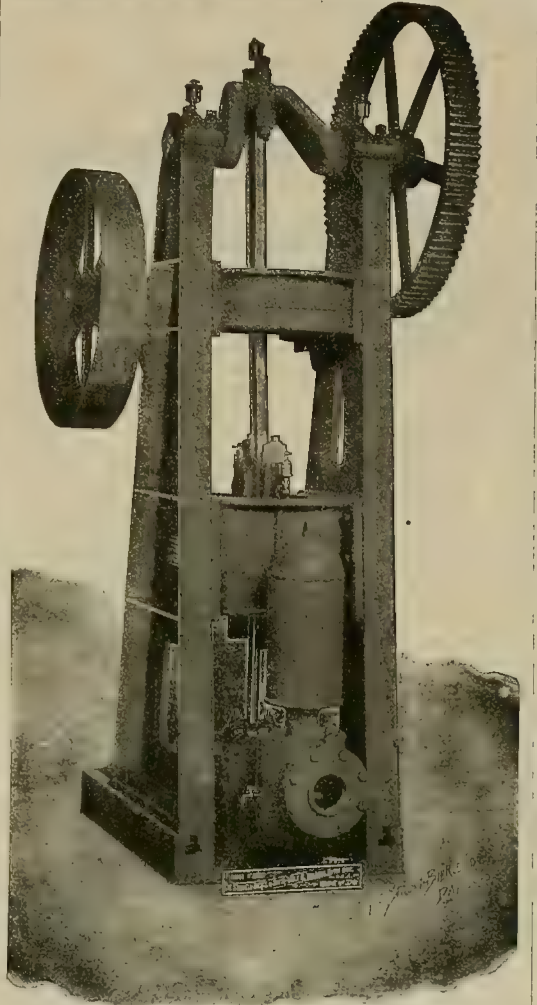
This invention relates to means of fusing, or otherwise treating by heat, metals or other bodies in crucibles by direct impact of a blow-pipe flame upon them. For this purpose an arrangement such as is shown in the accompanying figures is employed. The crucible C with its metallic or other contents M is placed within a furnace chamber having near the bottom an outlet O leading to a chimney. Through the top of the chamber centrally over the crucible there is a vertical duct D, into which is led laterally by a branch B a mixture of air with gas or combustible vapor supplied by a pipe G acting as an injector nozzle, so as to draw in air. In the center of the duct D a jet of air is directed downwards from a pipe A. A flame of intense heat is thus caused to issue from the duct D and to impinge directly on the material M in the crucible, the products of combustion ascending along the interior of the crucible wall, passing over its upper edge, and then descending outside the crucible to the chimney outlet at the bottom of the chamber, as indicated by the arrows. Through the cover of the chamber there may be a number of holes H controlled by a turning valve, for admission of air, so that a flame is produced surrounding the crucible and so accelerating the fusion of its contents.



Bickford Crucible Furnace.

Deep Well Working Head.

Herewith is illustrated the latest design of the Smith–Vaile deep well working head of the differential type, considered by the manufacturers suitable for both open and drilled wells. The stroke is 24 inches in length, the machine being designed for adaptation to size of working barrel, depending somewhat, however, upon the maximum lift. It has been installed in some of the larger office buildings, elevating water 375 feet in the new Montgomery–Ward building in Chicago. The crank is of steel; crank bearings of liberal area. The gears are of charcoal iron, machine cut. The pinion shaft operates in ring oiling bearings. The connecting rod is of steel, provided with bronze boxes at crankshaft connection, and also with adjustment device at crosshead connection. The crosshead operates in an adjustable shoe. A water box is also provided, and there is located beneath the air chamber a check valve. Further particulars may be obtained by addressing the manufacturers, The Stilwell–Bierce & Smith–Vaile Co., 276 Lohman street, Dayton, Ohio, U. S. A.



Smith--Vaile Deep Well Power Pump.

THE Manufacturer says: "For good or evil to our manufacturers American coal is going to Europe in rapidly increasing quantities. The immediate cause is found in the Chinese and South African wars. Markets held hitherto exclusively by English coal have been opened to us. The superiority of our coal for steam purposes has finally been forced home to possible buyers. Had we been wise enough to build and aid ships ten or twelve years ago we would be in the Mediterranean with coal, ton for ton as cheap as England. We have been too careless. There are those who think and say we should husband our resources in coal; that a time will come when we will want what we are now exporting, but that time is many generations distant."

Boulders in Mines.

The finding of water-worn boulders at great depths in mines has been a source of wonder to miners, and has been the cause of some theorizing as to how the boulders got there. A few such occurrences have been noted by the journals, but doubtless many such finds never found their way into the columns of a paper.

Some twenty years ago an extensive bed of sand and rounded, water-worn boulders was found in the California mine at Central City at a depth of 500 feet.

Some time in the 80s a nest of boulders was found in the Virgin lode on Republican mountain. The boulders were firmly cemented in the gangue rock and some 60 feet from the surface.

At a depth of 230 feet a large number of water-worn boulders were taken out of the Brannigan lode on Leavenworth mountain.

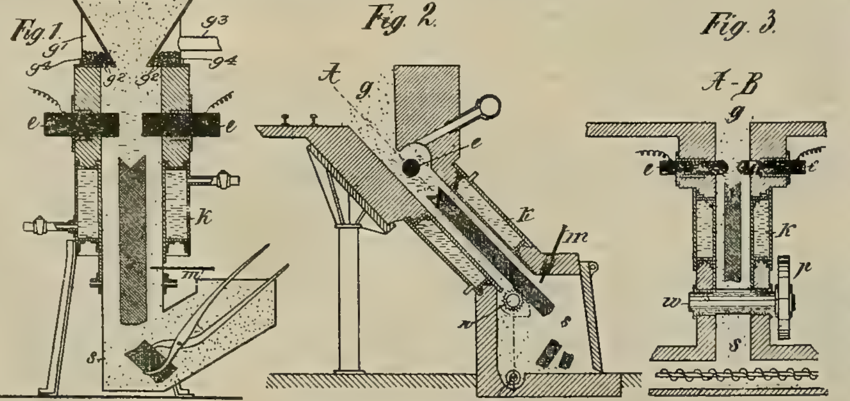
In 1880, while driving a level on the Shively mine, a large number of rounded boulders were found, varying in size from pebbles to those measuring 8 or 10 inches in diameter. They were found at a depth of about 400 feet from the surface and were all granite.

Boulders of galena were quite common at a depth of about 125 feet in the Last Chance mine at Creede, and boulders of eruptive rock, coated with a thin scale of mineral, are common in the Bassick mine, Silver Cliff.

Their occurrence is an interesting study for the geologist. The only tenable theory advanced by the miners is that they fell into the crevices before the process of filling was completed. — Georgetown, Colo., Courier.

New Electric Furnace.

The newest thing in electrical furnaces is illustrated herewith, as noted in the N. Y. Electrical Review. In the manufacture of calcium carbide and other products in an electric furnace requiring high temperatures the following difficulties have been met with: The mixture to be heated partly escapes decomposition when passing the region of the electric current, while another part is whirled out of the furnace with the gases arising during the electro-chemical and thermo-chemical reactions. That part of the furnace charge which passes the electric heating region undecomposed, together with a part of the manufactured product, will in many cases suffer damage by combustion, because it can not be prevented from leaving the furnace in too hot a condition. By this invention it is not intended to avoid a moderate part of the furnace charge passing the electric heating region undecomposed, because by allowing a part of the furnace charge to pass the furnace undecomposed this part will not only help to protect the furnace walls against the action of the electrically heated products, but it will also greatly help in keeping up the necessary isolations; yet all other difficulties enumerated above will be done away with. In carrying out the idea the usual electric furnace is provided with a feeding hopper and electrodes. The lower portion of the furnace, however, is surrounded by a water jacket through which cold water is continuously passed. This jacket cools the products of the furnace as well as the undecomposed portion of the charge, and prevents such losses as are unavoidable when the products of the electric furnace leave the furnace hot as they are and come into contact with air. This is not only important for the ready product, but especially for the undecomposed part of the furnace charge, which in most cases consists of oxides and carbon. Coming out too hot, the carbon will catch fire and burn away from the mixture, which, in order to be used again, will have to be mixed with a fresh portion of carbon before being returned to the furnace. As the undecomposed part of the furnace charge comes out cool, it can immediately be returned to the furnace, together with fresh charges. The chief product itself will not suffer deterioration if after completion of the originating reaction it is sufficiently cooled inside the furnace.



Improved Electrical Furnace.

MINING SUMMARY.

ALASKA.

In his report to the Director of the Mint from the Nome district, special agent Cabell Whitehead says:

"Of the new discoveries since last season, Topkuk, located on the beach 60 miles east of here, easily takes the lead. From a space not over 500 feet in length along the beach to the tundra there was taken out this spring between $500,000 and $600,000, all with rockers.

"The latest strike, and one which is at present attracting much attention, is on the Bluestone river, in the Port Clarence mining district, something less than 100 miles from Nome. One of the tributaries of this river—Gold Run—is said to exceed in richness anything known heretofore, it being no uncommon thing to get from $10 to $20 in a single pan. The creek is entirely taken up.

"A source of gold which is attracting much attention at the present time is the ancient river beds along the head of Dexter and Anvil creeks. Some of these deposits are fabulously rich, nothing richer having been found in the Klondike, I am told, than some of the claims along Nickkala gulch. The extent of the deposits, however, has not yet been proven and another season will be necessary to demonstrate their value.

"I incline to the opinion that these ancient channels are the source of the gold found in all the countries in this district, as well as the gold taken from the beach, and, if I am right in this opinion, they should be very extensive, and may add millions to the world's production. I see no reason to doubt that during the coming winter, when prospecting can be done with the aid of thawing machines, these channels will be located, and next season will see a very largely increased production.

"In my opinion, the future of this district remains to be proven, with the chances largely in favor of its becoming in the next two years a very great producer.

"My estimate of the production up to this time is $1,500,000, with the chance of increasing this production before the end of the season to $2,000,000."

The Alaska-Treadwell M. Co. in September worked 40,658 tons ore, valued at $47,483, and 671 tons sulphurets, value $20,835; total output, $73,495. The ore averaged $1.81; working expenses for month, $20,500.

ARIZONA.

SANTA CRUZ COUNTY.

The new concentrating plant at the Mowry mine is in operation. Its capacity is thirty-five tons per day.

YAVAPAI COUNTY.

W. C. Brandon, Supt. Middleton mine, near Prescott, says the shaft, present depth 375 feet, will be sunk to a depth of 700 feet.

At an adjourned meeting of the stockholders of the Crowned King M. Co. at Taylorville, Ill., Oct. 8, it was decided to continue operations.

President Bosworth of the Verde Queen smelter, Jerome, says it will be started up again this month.

The Jerome News says that the new cyanide plant put in by the Copper Chief M. Co. on Equator hill is such a success that the plant will be enlarged.

CALIFORNIA.

AMADOR COUNTY.

The Democrat says the property of the Wildman G. M. Co. has been turned over to Chas. Bishop of San Francisco, who will operate it under an option to purchase. The mine has paid off its employes.

I. N. Holman of Ione has sold to San Francisco men for $9000 a promising gravel proposition near Wallace.

W. R. Bacon, Supt. of the N. Clark & Co. claybanks at Dashville, is taking out clay; is used by N. Clark & Co. of Alameda in the manufacture of terra cotta goods.

The Mutual mine, after cutting through 4 feet of ribbon rock, has opened a body of ore on the east drift of the 400 level.

The Plymouth Development Co. is organized. Directors—J. Cook, E. B. Cutter, J. Dolberg, E. W. Ferguson, T. J. Parsons, E. W. Taggard, G. D. Gray, W. W. Douglas, S. K. Thornton; capital stock, $360,000; subscribed, $900.

Ledger: At Jackson, forty stamps at the Kennedy mine and forty at the Zeile are in operation, mines producing as usual. ——A few men are at work at the Argonaut.——In the Bunker Hill the old shaft has been retimbered to a depth of 655 feet, at which point the old timbers were found intact.——By November 1st the shaft of the Peerless mine will be down 500 feet. ——At the Lincoln mine, Sutter Creek, at the 1200 level, drifting north and south is to be done.

CALAVERAS COUNTY.

At the Melones Company dam, near Robinson's Ferry, 110 men were at work before the recent rains. Two centrifugal pumps, capacity 240 and 180 inches, respectively, kept the pit free from water; three steam derricks removed the gravel and stone. The pit is 110 feet long, 50 feet wide; height of dam when completed, 20 feet above low water mark. The water is to be taken out through a flume 4x9 feet, which, with a tunnel ⅛ mile long, will make a distance of 3 miles from the dam to the turbine.

The Oriole M. & M. Co. thinks of sinking its 400-foot shaft 400 feet deeper, at a cost of $8000.

EL DORADO COUNTY.

M. L. Smith, at the Rosebud mine, near Fairplay, will build a 5-stamp mill.

The Placerville Nugget says that the river bed mine at Salmon Falls, which was being developed by Messrs. Drew, Cohn & Donnelly, has been abandoned. After spending a sum of money they found they were developing a worked-out claim. The bed of the river was covered with several feet of debris and there was no indication on the surface that the river bed at that point had ever been worked, but when bedrock was reached various mining implements were found instead of gold.

LOS ANGELES COUNTY.

At Newhall the Pioneer White Oil Co., drilling in Placerita canyon, is down 650 feet and has finished putting in 9⅝-inch casing.

In East Los Angeles the Standard Union Oil Co. is down 600 feet in 7⅝-inch casing. Considerable water has been found.

MADERA COUNTY.

At the works of the California Copper Co. Manager Langford will continue sinking the shaft at the north end of the mine to a depth of 500 feet; thirty men are at work.

MARIPOSA COUNTY.

The Mary Harrison shaft, near Coulterville, will be sunk to a depth of 700 feet, when crosscutting and drifting will begin.

MONO COUNTY.

The Mono Marble Co. of Oakland will work at Antelope valley.

NEVADA COUNTY.

The Reward mine shaft is now unwatered. It is now equipped with a new electric power plant. When sinking is resumed additional men will be put to work.

The Herald says that the Delhi mine is turning out fine ore.

The Union learns that the idle 30-stamp mill at the Champion mine, near Nevada City, will be renovated. At present the company is running its 40-stamp mill.

PLACER COUNTY.

A. Bordeaux is manager of the Ralston Divide G. M. Co.'s property, a drift mine in a territory described and illustrated at considerable length in the issue of July 30, 1898. His nearest postoffice is Georgetown, 30 miles away; his supplies are received at Summit station. A system of ditches, when completed, will furnish water the coming winter to carry on hydraulic operations that are expected to reimburse the company for its considerable outlay. Felix Chappellet is president of the company, which has acquired possession of considerable valuable property which will be thoroughly developed. Mr. Chappellet has already shown considerable nerve in such enterprises. When at the Mayflower he determined that by adopting a certain course the ancient channel could be found, and for this purpose a tunnel 5585 feet long was driven through hard slate at a cost of $150,000, with entire success. That section has yielded about $30,000,000, which is considered to be but an index of the amount yet to be extracted therefrom.

Sentinel: At the Occidental gravel mine at Grizzly Flat, near Iowa Hill, the main tunnel has followed the channel 350 feet. Crosscuts show a width of about 400 feet.——At the Herman quartz mine, near Westville, the new tunnel taps the ledge at 1400 feet and has been extended 300 feet on the ledge. Thirty-five men are employed.

PLUMAS COUNTY.

Konradi & McElroy have leased the Duncan gravel mine, on the East Branch, and will work it by hydraulic elevator.

RIVERSIDE COUNTY.

Studenraugh & Barta, 12 miles northeast of Capistrano, have spent the summer running a tunnel 65 feet with a 7-foot dike of what they think is tin ore in the face. The local paper says assays indicate that this ore runs from 3% to 6% tin. It carries iron and traces of silver. This property is about 20 miles from the Temescal mine.

SAN JOAQUIN COUNTY.

At Stockton a briquette factory will be built with daily capacity 500 tons. The briquettes will be made from coal dust, screenings and petroleum.

SANTA CLARA COUNTY.

The Hood M. Co. has incorporated at San Jose; capital, $100,000; $62,000 subscribed: J. H. Burkhart, C. D. Hayward, T. J. Gillespie, P. Long.

SHASTA COUNTY.

The Mountain Copper Co. has declared an interim dividend of 9s per share, payable at the London office October 10th; 99,948 tons of ore were smelted at Keswick during the six months ended June 30th. The copper produced was sent to the company's works at New Jersey to be refined, where the output of fine copper during the six months was 5038 tons; sales of finished copper for delivery during the six months aggregated 4962 tons.

C. F. Dougherty has chrome ore in his mine on Shotgun creek near Chromite. Former owners shipped 3000 tons of chrome in one season to the East for paint manufacturing. The ore is now being used extensively for linings for smelting furnaces. He has taken out and shipped 400 tons this season.

SIERRA COUNTY.

At the Sierra mine, Supt. Finney has built a flume 2600 feet long, a pipe line 800 feet long, and put a jet pump and hoisting works in place.

The Thistle shaft on the Gibsonville ridge is started. Thirty men are at work.

SISKIYOU COUNTY.

The Cherry Hill quartz mill, Cherry creek, is in operation under management of E. D. Baker.

SONOMA COUNTY.

C. Bell of the Socrates quicksilver mine at Pineflat has had six retorts constructed upon plans of his own whereby he figures that 98% of the mercury in the ore treated will be saved. The metal easily vaporizes when distilled, and with this vapor go the profits. Each of the six retorts is capable of treating 2700 tons of ore in twenty-four hours if run at its full capacity. A new crosscut to the vein from the main tunnel has discovered 5% black oxide and quicksilver. Mr. Bell says the ore newly exposed contains $1.75 gold and three ounces silver to the ton.

TRINITY COUNTY.

Whitmore & Young's gravel claims on Oregon mountain, at the head of Democrat gulch, are sold to San Francisco men. A 25-mile ditch will be in charge of O. C. Loveridge. Water will be taken from Canyon Creek falls, 6 miles above Dedrick.

A strike of rich ore is reported in the lower tunnel of the Brown Bear mine, Deadwood.

At Harrison gulch ten men are doing preliminary work at the W. R. Hall mines.

C. D. Galvin has 140,000 pounds machinery for a dredger to be operated near Weaverville to be in operation by Dec. 1st.

Geo. L. Carr, owner of the Yellow Rose of Texas, on Union creek, expects to reopen the mill.

TUOLUMNE COUNTY.

The Genevieve M. Co. has incorporated; W. P. Scott, A. J. McGovern, M. B. Woodworth, T. M. Carrol, A. H. Warren; capital stock, $250,000.

One thousand feet of steel rail will be used in the tunnel of the Golden West M. Co., near Sonora. The company will build a mill next spring.

S. S. Petrovitch is superintending development of the Comstock Ranch property for the Golden West M. & M. Co.

COLORADO.

BOULDER COUNTY.

The Bailey chlorination mill at Eldora has resumed.

At Sunnyside the Welcome G. M. Co. is operating the Silent Friend group of claims. G. L. Spence is manager and J. Murphy underground foreman.

At Salina the Valley Forge mine is sold to Cripple Creek men for $50,000. The property is under the management of Mr. Mathiews.

The Golden Eagle mine, owned by the Golden Eagle Exploration Co., has fifteen men at work under the management of Mr. Ellis.

At the Ingram mine six machine drills are running.

A strike is reported in the Melvina mine. At a depth of 600 feet a streak of tellurium ore, 3 inches in width, running 200 ounces gold per ton, was encountered.

Miner: On some of the wolframite ore from Burnt mountain, in Denver, values running $200 to $300 per ton were obtained. J. H. Knight was the first to discover wolframite in that district, and in his lead can be found wolframite ore carrying 60% tungstic acid.——At the B. & M. mine Supt. Bossen has in the 700 west level solid smelting ore 3 feet wide.

CHAFFEE COUNTY.

Near Buena Vista the Boston M. & D. Co. has two mines, the Lone Star and the Edith, and are putting in machinery. Manager C. A. Smith is unable to hire the men he wants, none being available in that county, and that is holding them back. A 9x5 shaft that develops the two mines is down 96 feet, timbered with California square-cut redwood; the shaft is an incline.

EL PASO COUNTY.

At Colorado City the Portland's new chlorination plant will cost $300,000; the structure will be of steel.

GILPIN COUNTY.

Shipments of smelting and crude ores concentrates and tailings from Blackhawk to outside smelters and other points of treatment for the last week of September were eighty-one cars. The entire month's shipments were 304 cars—5624 tons.

Register-Call: During September there were shipped from the Black Hawk depot of the Colorado & Southern railroad 304 cars of ore, 5624 tons, representing the shipments of smelting ore, tailings and concentrates, to Denver and other smelters, and shipments of crude ore to outside points for treatment.——Manager J. W. Bostwick, at the Clark-Gardner mine on Quartz hill, at a depth of 825 feet, has a good vein exposed. The property is operated by the Rome-Gardner M. Co.

HUERFANO COUNTY.

Walsenburg reports the Slone-Ripley-Sefton mine, on the west slope of Greyback mountain, in the Greyback district, 40 miles west of there, sold for $60,000 to N. Meade of Colorado Springs, N. Gandy and C. E. Barney of Springfield, Ill. Thirty miners are working ten cars of hematite iron that will be shipped, assay-$100 per ton. As soon as the new owners take full charge more men will be put to work.

LAKE COUNTY.

The Leadville ore output at present is about 2000 tons a day, and the advance in silver is encouraging to mining men. An advance of 5 cents an ounce would mean an increase of $1000 a day.

Carbonate Chronicle: Leadville has abundance of manganese ore, but competition is so keen that profits on shipments to Chicago are very low. The demand for all manganese ore is very great in the East. The mines of Virginia, Arkansas and other points can not supply it, and the big iron and steel works must necessarily go outside for their supply, and shiploads are brought in from Peru, Russia and Cuba. In the smelting of manganese, the separation from the iron is not complete, two products being made—speigeleisen, where the iron is more than the manganese, and ferro-manganese, where manganese is in lesser quantity than iron. The main trouble about mining the Leadville manganese is the question of freight. Unless the ore is up to a certain standard it will not pay to ship. If a furnace could be erected at Leadville to reduce the manganiferous iron to a ferro-manganese, about 40% of the weight would be eliminated, and the product could then be shipped with profit.

OURAY COUNTY.

The British option on the Camp Bird properties at Ouray has been extended sixty days for further investigation. The price is $13,000,000 in London; $6,500,000 in Colorado. Twenty stamps are being added to the mill. The new cyanide mill —100 tons daily capacity—will be in operation Nov. 10.

J. S. Loder has bought the Badger mill, near Ouray, and will convert it into a pyritic smelter.

PITKIN COUNTY.

Aspen reports a strike in the Last Dollar mine, Bull hill, impregnated with sylvanite.

The Lexington Co. has sent a shipment of 100 tons of $30 mill ore and forty tons smelting grade, which goes about $75.

SAN MIGUEL COUNTY.

The Butterfly-Terrible Co. of Ophir produced in September $8000. Since starting the mill April 20, $28,000 has been produced.

The Tom Boy M. Co. mill during twenty-eight days crushed 4300 tons ore; estimated value, $46,000. Concentrates shipped, 265 tons, valued at $4000. Expenses of month, $35,000; of the expenses $3800 was for the purchase and installation of a new hoisting engine.

TELLER COUNTY.

Lowery, Sheidler, Whiteside & Co. of the Christmas, above Goldfield, have a 2-inch streak of talc that assays twelve ounces.

Near Victor operations on the Bertha B. have resumed. J. S. Fitting has a bond and lease for two years at $25,000.

The Stratton Cripple Creek M. & D. Co. has started work in the Chicago-Cripple Creek tunnel. A double compound compressor, to operate eight drills, will be installed over the deep shaft of the John A. Logan. Machinery will be put in over the shaft capable of operating the mine to a depth of 3000 feet. The shaft is now down 1400 feet. The Gold hill and

Bull hill groups will be worked simultaneously.

During September the Vindicator mine produced 2500 tons of ore, 60% milling grade and the balance smelting grade ore.

The El Paso M. & M. Co. has the shaft down 500 feet and will sink 200 feet deeper by Jan. 1st.

IDAHO.

ADA COUNTY.

A Boise case involving the right to cut timber from mineral land is before the U. S. Commissioner. Ridenbaugh & Rossi were arrested on the charge of illegally cutting timber from the public domain. They admitted that the timber had been cut, but under the circumstances claimed it was not a violation of the law, which permits the cutting of timber from such portions of the public domain as is known to be mineral in character and subject to entry as mineral land only. The complainant, E. T. Staples, claimed the mining property from which the timber was cut. As he desired the timber for his own use he caused the arrest. The land being mineral in character, the U. S. District Attorney caused the complaint to be dismissed. It has been supposed that the holder of a mining claim was entitled to the timber thereon. If the construction that he is not be correct, the miner is afforded no protection whatever with respect to the timber. He furnishes the proof that the land is mineral bearing and any one can take advantage of it and cut the timber off. It is likely a test case will be brought soon with the view to having the question definitely settled. Officials at the land office are under the impression that the mine owner could prevent the cutting of timber from his claim. As there is nothing in the law preventing the cutting of timber from a mining claim, however, the miner cannot secure protection through the criminal courts. His remedy, if he has any, lies in a civil proceeding. Receiver Garrett of the Boise Land Office says: "While the law permits the cutting of timber from mineral land, still the man who appropriates the timber therefrom is not the sole judge as to the character of the land. The government can at any time require him to furnish proof that the land is mineral, failure to do which would be followed by proceedings in the federal court."

ELMORE COUNTY.

At Rocky Bar the Sawtooth Co. has reduced wages from $3.50 to $3 a day.

SHOSHONE COUNTY.

The Crescent mine, near Pierce, has its mill in operation.

MICHIGAN.

HOUGHTON COUNTY.

At Houghton, shafts Nos. 1, 2 and 3 of the Tamarack are sending out 55,000 tons of rock per month. The new No. 5 shaft is down 4486 feet. It was begun in August, 1895; it will be a full mile deep when completed in January, 1901, exceeding the Red Jacket shaft of the Calumet & Hecla, and becoming the deepest mining shaft in the world.

The shaft on the Mesnard portion of the Quincy is progressing. This shaft, at a depth of 4000 feet, will make connection by a long drift with the northernmost shaft of the North Quincy, once the Pewabic, passing under the Franklin workings.

MINNESOTA.

ST. LOUIS COUNTY.

On the 7th at Eveleth 7500 pounds dynamite in the powder magazine at the Spruce mine, ½ mile from town, blew up. A hole 100 feet square and 25 feet deep marks the spot where the magazine stood. The mine laboratory and warehouses were totally wrecked. Two hundred people were slightly hurt from being thrown down by the shock or hit by shattered glass.

MONTANA.

DEER LODGE COUNTY.

The Nipper is being worked under the receivership of T. McLaughlin. A new gallows-frame over the new shaft is 90 feet high; the skips carry five tons.

LEWIS AND CLARKE COUNTY.

The Bell Boy at Empire, under lease to Z. Vinson, is producing ore averaging $20 gold, two ounces silver, 8% lead.

MADISON COUNTY.

The Watseka Co. employ sixty men and have the Clark mill under lease.

MEAGHER COUNTY.

At Copperopolis Reynolds & McDowell are working the North Pacific, the Darling Fraction and the Copper. A shaft is being sunk on each. That on the North Pacific is down 500 feet; on the Darling, 125 feet; on the Copper, 250 feet. One hundred men are on the payroll. A townsite is being laid off.

SILVER BOW COUNTY.

On the 3d at Butte the engineers of the Gagnon mine struck for $5 per day instead of $4 they have been receiving. The management refused the demand and the engineers walked out.

NEVADA.

CHURCHILL COUNTY.

Barbee, McDonald & White of Colorado Springs, Colo., have bought out the Bell Mare C. M. & S. Co. for $100,000. There are two ledges of 6% copper.

ESMERALDA COUNTY.

H. T. Benson of Denver has bonded the Homestake, Summit, Sapphire, Savage, April and Poor mines, near Silver Peak, for $13,500; $1000 is to be paid before Nov. 1, 1900, $12,500 before Aug. 1, 1901. He has also bonded the Great Gulch and May mines near Silver Peak for $15,000—one-half to be paid by Dec. 1, 1901, the balance by June 1, 1902.

LINCOLN COUNTY.

(Special Correspondence).—Yellow Pine mining district, in the southern part of Lincoln county, southern Nevada, is very slow in developing on account of lack of facilities of transportation, lack of fuel and water. One man, Allen G. Campbell, has twenty-four patented claims in the heart of the district. No work is being done on any of them.

Mr. Newby, Deputy United States Mineral Surveyor, is surveying four claims for patent for Mr. Ritchie of Pueblo, Colo.

The Keystone mine, in the past a noted producer of the yellow metal, was under examination during the past week by Captain Hutton of Los Angeles, assisted by C. A. Beck of Goodspring. On the final report will depend the reopening of the mine.

C. M. Over, owner of the January copper mine, on the eastern slope of Potosi mountain, is pushing work in developing the claim, crosscutting the vein and running a tunnel, at the same time extracting copper ore averaging about 25%. This mine has paid all developing expense, besides standing an expense of $28 per ton shipping and smelting charges, and making for its owner a handsome net profit on each shipment.

A. E. Thomas is making another shipment of copper ore.

Bowen & Green, who have under bond the Azurite copper claim for $5000, are pushing work with three shifts, extracting and shipping copper ores. Between the copper vein and footwall, vein material several inches in thickness, assaying three ounces in gold per ton, occurs. Of course, this is carefully saved.

The Green Monster, under bond to the Hearst estate, Supt. Wilkinson, is showing up fine, the ore assaying an average of gold $5, silver ten ounces, copper 8%. Work is being prosecuted with vigor. Three shifts are employed, sinking and drifting.

Goodspring, Oct. 7.

STOREY COUNTY.

The official telegram of the drainage work at the C. & C. shaft of the 11th inst. says:

At 6:30 this morning the water was 193 feet 4 inches below the 1950-foot level station. No 1 elevator has been running continuously.

The Confidence, Challenge Con. and Con. Imperial mines report the west crosscut from the surface tunnel is now out 2745 feet, having been advanced 30 feet during the week. The face is again in hard porphyry. General repairs to this crosscut are still going on.

The Belcher says: On the 100-foot level the north drift from the west crosscut has been cleaned out and retimbered 11 feet during the week, its total length now in good repairs, 36 feet. The south drift from the west crosscut on the same level is now out 24 feet, having been advanced 8 feet during the week. The face of this drift is in ore giving an assay value of $15.61 per ton. On the 1100-foot level the Belcher, Crown Point and Yellow Jacket joint drift is being repaired.

The Justice says: At a point in the upraise from the south drift, 100 feet above the drain tunnel, have started a south drift following the ledge and advanced it 10 feet; face in porphyry quartz giving low assays.

WHITE PINE COUNTY.

(Special Correspondence).—A new mill has been built at the old Star mine, at Cherry Creek, which is equipped with crushers, rolls and concentrators. It is not now operating, having closed by reason of a shortage of water. This is 75 miles west of Ibapah, Utah.

Cherry Creek, Oct. 8.

C. H. Scheu, at Muncy, is sinking on a ledge in which 4 feet of ore shows 50% lead, ten ounces silver and $1 gold.

NEW MEXICO.

BERNALILLO COUNTY.

W. C. Wynkoop of the Cochiti Reduction & Improvement Co. has purchased for his company the Good Hope mine. The ore assays $12 gold and silver.

The Albemarle at Bland has its shaft 700 feet deep. It will be sunk 300 feet deeper.

COLFAX COUNTY.

Near Elizabethtown the Moreno placers which have been acquired by a Buffalo syndicate will be worked 2½ miles along the Moreno creek, a width of 1500 feet.

The Cleveland Co., operating the Cleveland group at Elizabethtown, has a body of ore 20 feet wide averaging $12 gold to the ton.

LINCOLN COUNTY.

Record: The American Placer Co. at Jicarilla is working a large force of men. ——Old Abe coal is freighted from White Oaks to Roswell and sold at $12 a ton.—— A 125-stamp mill has been recommended to be built by the Boston Boy M. Co. at White Oaks by Supt. Preswick.——A strike of ore is reported at the Compromise mine at White Oaks.

RIO ARRIBA COUNTY.

The Admiral G. & C. Co. has incorporated at Hopewell; agent, Thos. Smith.

SAN MIGUEL COUNTY.

The Deming M. & M. Co. is incorporated; N. G. Noel, H. E. Runkle, D. Bauman, A. R. Graham, S. Field; capital stock, $30,000. The company intends to erect a smelter at Las Vegas.

TAOS COUNTY.

The Red River copper district is attracting attention. It is in the Keystone mining region, in the vicinity of Elizabethtown and Amizette. H. J. Reiling & Co. are arranging for a dredger near Elizabethtown.

The Rio Grande Co. has nine claims 4 miles from Red River City and has started a tunnel to cut the main veins.

On the Copper King, opposite Red River, an Eastern company is sinking a shaft 300 feet.

The Memphis & Edison Co. has a developed property, R. Pooler, manager. Two carloads of ore shipped to Pueblo gave $33.50 per ton. Men are sinking on the main lead.

OREGON.

BAKER COUNTY.

The California Con. G. M. & M. Co. has incorporated at Sumpter; capital stock, $1,000,000; E. T. Warren, W. H. Jackson, S. H. Bell.

Near Baker City, nine Cincinnati men, who recently bought the Baby McKee mine, have placed J. T. Grayson in charge of the development work. The old tunnel is in 616 feet; the new 5000-foot tunnel 414 feet lower than the mouth of the old tunnel. The new tunnel, when in to a point immediately under the apex, will give a depth of 2260 feet.

A dispatch from London states that the Red Boy mine, near Baker City, has been sold to an English company for $2,000,000.

SOUTH DAKOTA.

At Lead the Homestake Co. is repairing the old Father DeSmet stamp mill. They will sink 2000 feet. The old Caledonia stamp mill is also being repaired. The repairing of these old mills, with the Deadwood Terra, will give a total of 340 stamps. About 1500 tons of ore per day will be treated by the three mills.

UTAH.

BEAVER COUNTY.

(Special Correspondence).—The Imperial M. Co. is obtaining good results in developing the Imperial mine, which adjoins the Horn Silver. The 300-foot tunnel goes in on the strike of the vein, the ores encountered being copper-iron sulphide. A recent shipment of thirty-four tons ran 16% copper, $5 gold and six to eight ounces of silver. T. R. Jones of Salt Lake and Eastern parties are chiefly interested, A. B. Lewis being manager.

Frisco, Oct. 6.

BOX ELDER COUNTY.

(Special Correspondence).—The Vipont mine, operated by the Salt Lake Mining & Improvement Association, ships an occasional car or ore, the last shipment of twenty-three tons netting the Association $2000, the product being silver in form of native wire silver and chloride of silver, with some sulphides. It is claimed the property has a vein 7 feet in width. The property includes a small concentration mill which may be enlarged.

The Sierra Madre mining district, encompassing the section around Maguire's peak, 10 miles north of Ogden, is attracting special attention by reason of recent developments there. A company of Michigan men are developing the Uwanta group and the adjacent El Dorado group is being developed by a company of Californians. The altitude of Maguire's peak is 9125 feet, that of the Uwanta and El Dorado groups about 8800 feet. Each group is being developed by a tunnel which cuts into the same ore zone. The tunnels are about ¾ of a mile apart, both trending eastward. The Uwanta is being driven on a 20% incline, is in 200 feet, all of the distance in ore, with drifts in ore at 75 and 150-foot stations. The ore zone is claimed to be a sedimentary deposit, in contact form, lying between dolomite lime below and blue lime above. The ores comprise a steel galena, associated with iron sulphides and lead carbonates, the gangue being a siliceous material. The values are said to run from 20% to 80% lead, 4 to 12 ounces silver and 50 cents to $2 gold to the ton.

Ogden, Oct. 3.

IRON COUNTY.

(Special Correspondence).—The Ophir mine management has straightened and retimbered the old shaft and sunk it to 300 feet depth. A 50 H. P. gasoline engine operates the hoist and a belt-driven compressor. At present depth the ore is more of a sulphide than that obtained nearer the surface. The main object now is development, and the only ore shipped is the high grade, which is sacked.

The Johnny mill is operating on ore from the Johnny mine, and considerable development work is in progress in the Stateline district.

Stateline, Oct. 3.

JUAB COUNTY.

(Special Correspondence). — Manager McIntyre of the Mammoth mine states that the large ore chute, well opened on the 800 level, will doubtless soon be tapped on the 900 level. A connection has been made on the 1700 level with the winze from the 1600-foot level, the winze being on the ore chute.

The May Day is developed by a tunnel which crosscuts 700 feet to the ore body. From the point where the ledge is intersected, various drifts have been run which exploit the ore on that level; at the breast of the tunnel is a hoisting engine and a 200-foot shaft which sinks vertically on the zone, there being drifts from the shaft also at the 100-foot station. The station at 200 feet depth in the shaft was recently cut. The shaft cuts the ledge on the latter's dip between the 100 and 200-foot stations. The ores average about $5 to $50 gold, 30% to 53% lead, 10 to 22 ounces silver, the shipments of this grade running from 300 to 500 tons per month. It is estimated that there are about 10,000 tons of milling ore on dump and in mine which will, according to samples tested, average 13% lead, 9½ ounces silver and $5 gold to the ton. The building of a concentrator to handle ores of this grade is to be considered. The May Day seems to be on the same mineral zone as that on which the Godiva, Uncle Sam, Humbug, Yankee and La Reine are located.

The Yankee is opened by a 1300-foot tunnel which crosscuts the formation, a 40-foot upraise from which taps the ore body at 600 feet below the surface. Capt. T. Egan, manager of the property, states that a recent car of ore shipped ran 50.5% lead and 47.5 ounces silver, and that a still later shipment of two cars will average about the same. The Yankee is owned by Salt Lake and Eureka parties.

The directors of the Lower Mammoth M. Co. have levied an assessment of 5 cents per share on its stock issue to raise $7500 for the purpose of liquidating indebtedness and to open up some known ore shoots.

The Centennial–Eureka shipped thirty-one cars of ore for the week ending Oct. 6. There are 230 men on the payroll.

Shipments from Tintic district for the week ending Oct. 6 amounted to eighty-five cars of crude ore and eight cars of concentrates, bullion shipments amounting in value to $3500.

Eureka, Oct. 5.

(Special Correspondence).—The Queen of Sheba mine, under bond and lease to the Ibapah M. Co., composed largely of Chicago parties, is 6 miles east of the Nevada line, on the western slope of the Ibapah range, and at 9200 feet altitude. The location is 100 miles south of Toana station, on the S. P., and 175 miles from the Oregon Short Line Railroad at Stockton. The mine is opened by tunnels and winzes, the ore being partly free-milling gold. The mill on the property was destroyed by fire a few months ago, and now a new 10-stamp mill, with concentrators and cyanide tanks, is being erected. The mill will be run by water, through 1400 feet of pipe, at 425 feet pressure to a 6-foot wheel, producing 40 H. P. However, steam power is also being provided. There is an abundance of water in the Ibapah range.

Ibapah, Oct. 8.

PIUTE COUNTY.

(Special Correspondence).—The Dalton mine, in Bullion canyon, near Marysvale, is being further developed by a 1400-foot tunnel and an inclined shaft, which will be connected. Work in tunnel has gone 400 feet and that in shaft 250 feet. A small tonnage of ore is produced incidentally, which carries gold, silver and lead. O. R.

Young of Salt Lake City has the supervision of the work.

Marysvale, Oct. 8.

SALT LAKE COUNTY.

(Special Correspondence).—The American Smelting & Refining Co. has closed its gold sampling and refining rooms in Salt Lake City, which for several years handled most of the bullion and aurocyanides produced in this section; and this company invites its customers to send their base product to its refinery at Argentine, Kansas.

Salt Lake City, Oct. 2.

(Special Correspondence).—It is given out that the Dalton & Lark mine, near Bingham, is under bond and lease to Eastern parties, the time named being one year, during which time said parties are to develop the property thoroughly.

The Bingham Copper & Gold Co. has confined its mining operations to development work the past few months. Near Lehi Junction, however, this company's pyritic smelter is under construction and is under the management of W. H. Nutting.

Bingham Canyon, Oct. 2.

(Special Correspondence).—The concentrating mill of the Fortune M. & M. Co. is operating by electric power, transmitted from the Jordan Narrows plant, and is crushing and concentrating about forty tons of ore per day. Besides having a crusher and two sets of rolls, the mill is equipped with screens, four three-compartment jigs, two Wilfley tables and one Frue vanner. The ore thus far milled is a lead sulphide, carrying also silver values. The product is divided into four grades: That from the No. 1 jig compartment yielding about 45% lead; No. 2 compartment 30%, and No. 3 about 15% lead; the table product runs an average of 25% lead. The entire jig and table product is estimated to carry ten ounces silver to the ton. The highest jig product carries from 12% to 15% iron, the other grades running from 25% to 30%, which is allowed for by the smelters at the rate of 15 cents per unit. The ores carry a considerable quantity of silica, which is largely eliminated by the concentrators. The jig and table products also carry from 1% to 2% copper and small gold values. The Fortune Co. has a connection with the Dalton & Lark tramway line, over which its concentrates are carried to the railroad and supplies to the mine and mill. Elmer Hill is manager of mine and mill.

The new upper and lower terminals of the Highland Boy tramway line are being constructed. The upper is at the entrance to the No. 7 tunnel at the mine. The lower is at the railroad track in Bingham canyon, the line being 12,500 feet long. The carrying capacity of the line will be 500 tons per day. The Highland Boy smelter at Murray is also being enlarged to increase its capacity to 500 tons. The week's bullion product of the Highland Boy Co. is given out as being 120,000 pounds, consisting of copper, silver and gold, same being sent to the refinery at Perth Amboy.

Shipments from the Silver Shield mine at Bingham on the 6th inst. amounted to three cars crude ore and two cars concentrates. The crude ran forty-two ounces silver, 41% lead, 2.7% copper, $2.20 gold, the concentrates yielding twenty ounces silver, 27.4% lead, $2 gold and 2.7% copper.

Bingham, Oct. 4. WASCOTT.

(Special Correspondence). — The Red Wing output for some time has been running about four cars per month, wholly the product of lessees. But from now on the Red Wing Company will take hold, with the idea of furthering development and increasing production. The building of a new concentrator is among the projects to be considered. The ores here run high in lead carbonates and silver.

The York, next to the Highland Boy, is driving a series of drifts from the incline tunnel to get at its ore body, which carries 25% lead, 3% copper and 10 ounces silver. The width of ore is about 3 feet. Some shipments are being made. The York is largely in control of A. J. Orem & Son.

Bingham, Oct. 6.

TOOELE COUNTY.

(Special Correspondence).—An occasional car of silver-lead siliceous ore is shipped from the mine of the Stockton Con. M. & M. Co. The last shipment amounted to 31,033 pounds, which, after deducting freight and smelting charges, netted the company $628.72. The returns showed that the ore ran 56.1% lead, 42.45 ounces silver, 19.3% silica, 4.1% iron, 4.1% sulphur. The shipment of another car will be made in a few days.

Stockton, Oct. 2.

(Special Correspondence).—The Chloride Point mill, in charge of M. D. Stackpole, is cyaniding about forty tons of ore per day, the precipitates on the zinc shavings running about 80% pure silver, with a small percentage of gold. The silver is largely in form of a chloride, the ores running in value from twelve to eighteen ounces per ton of ore.

Mercur, Oct. 3.

(Special Correspondence).—At the Overland development work is in progress in the mine, while the 150-ton cyanide mill is being increased to 500 tons capacity.

Sunshine, Oct. 4.

(Special Correspondence).—The West Argent M. Co., has erected a concentrating mill, which, it is thought, will be operating by Nov. 1. The mine is equipped with crushers, rolls, screens and Wilfley tables. The ores carry silver and lead, and the mill will run fifty tons per day for the first few months. A. L. Jacobson is mine Supt. and Frank R. Ball manager.

Stockton, Oct. 5.

(Special Correspondence).—The Hercules mine is shipping regularly about eight cars per month of silver-lead ore, the last shipment running 58% lead and nineteen ounces silver per ton. The property is now in charge of H. E. Zerbe.

The Utah mine, in Deep Creek section, is shipping from fifty to seventy tons of ore per month, which runs about 40% lead and 200 ounces silver. The ores are carbonates.

(Special Correspondence).—The Honerine now has five boilers, having an aggregate of 350 H. P., and has pumping facilities for handling 750 gallons of water per minute, consisting of Cameron sinkers and a Jeanesville station pump. The boilers are at the tunnel entrance, and Supt. Raddatz states that they are to try the experiment of conveying steam through 3450 feet of pipes to the pumps — that is, through 3250 feet of tunnel and thence 200 feet down a shaft. This shaft sinks near the ore body; drifts will be run from shaft to the vein as soon as the shaft shall be sunk 40 feet deeper.

Stockton, Oct. 6.

(Special Correspondence). — The West Argent incline shaft is down 600 feet, the base of which is below water level. Water being pumped is sufficient to supply the boilers and for mill work. Various drifts are run at different levels. The incline follows the dip of the vein. Veins run in opposite directions, the richest ore being found at the points of intersection. The ore is a galena and carbonate of lead, with good silver values with the lead. The mill will doubtless be in operation in a few weeks.

The Hercules is being worked by the owners, which include T. H. Benton & H. E. Zerbe, the latter being in charge. The incline shaft is 380 feet depth, most of the ore coming from the surface down to the 200 level. As is characteristic of the camp the richest ore here is found at the junctions of the veins that run in opposite directions. The ores consist of a lead and iron carbonate, the principal values being silver and lead. Besides the high grade ore that is regulary shipped to the smelters there is in the mine a large tonnage that could be classed as milling ore.

The Silver Coin mine, in charge of Alex. Maze, has made occasional shipments. A shaft will now be sunk 200 feet, and from it a level will be run to the ore body that was opened through tunnels at a higher point. This will give a depth of 500 feet.

The Stockton G. M. & M. Co, owners of the Ben Harrison and others, has a bond and two-year lease on the property of the Lion Consolidated, which joins the former. The same lode runs through both groups and plans are being made to operate them through a new shaft which is being sunk at a point some distance down the hill below the old Lion shaft. At present it is down 200 feet, and levels will be run 300 feet to the Lion lode, cutting it 200 feet below the old workings. The workings of the Lion and Ben Harrison will be connected. In the future all shipments will be through the new shaft. A new boarding house is being built and a force of sixteen men is at work in the mine. H. D. Trenam is Supt.

The Bunker Hill is being worked under lease to J. C. Reynolds and associates, who have been doing considerable dead work, but have a small tonnage ready for shipment. The ores carry silver, lead and gold, with a small percentage of copper. They are now drifting from the west end of the lower level, 200 feet below the surface. The values run about 50% lead, twenty to twenty-five ounces silver and $10 to $12 gold. Here and there is found a rich streak of chalcopyrites. Mr. Reynolds is also developing the Rush Lake group of five claims, which he owns.

The Ada group is being developed by F. J. P. Pascoe and others. WASCOTT.

Stockton, Oct. 9.

WASHINGTON.

FERRY COUNTY.

The Bodie M. Co., Toroda creek, Alex De Witz Supt., will buy a three-drill compressor, ore cars, track, ventilating apparatus and patent the claim.

OKANOGAN COUNTY.

Near Loomis the Palmer mountain tunnel is in 3675 feet.

At the Golden Zone a 1000-foot tunnel has been started. The mill is in operation.

The Quickstep, formerly the Detroit-Windsor, 6 miles from Loomis, has resumed.

WHITMAN COUNTY.

The Chickasaw M. & S. Co. has incorporated to operate the Blue Bird in the Hoodoo district, 40 miles from Palouse City; general manager, W. J. Springer, resident at Spokane.

WYOMING.

CARBON COUNTY.

At the Ferris-Haggerty M. Co.'s property, Manager I. C. Miller has the new hoisting plant completed. An electric light plant and rope tramway are under consideration.

FOREIGN.

BRITISH COLUMBIA.

The second payment has been made on the Britannia group of copper mines, 28 miles from Vancouver, which are being purchased by the Valentine syndicate of London, England. The total amount now paid has been $10,000; the next payment, $50,000, is to be made Jan. 1st.

The Kenneth M. Co., operating the Tamarac mine, near Ymir, will build a tramway 6000 feet from the Tamarac mine to the tracks of the Nelson & Fort Sheppard Railway.

At Savonas, C. E. Low of the Cinnabar M. Co. has a deposit of cinnabar. A. J. Colquhoun says: "About three tons of high-grade ore, which I would estimate should average 20% to 30%, are on the dump and a fine showing in sight." If the ore averages 1% it is all right. The "20% to 30%" is a slight exaggeration.

At Slocan the Two Friends sent a consignment to Nelson for smelting. It sampled 160 ounces silver and 33% lead, the shipment realizing $100 to the ton.

P. Corcoran, representing Dan Burns and others of San Francisco, has bought the Harris group, on White Fish creek, in the St. Mary's country, for $125,000.

Paul Johnson of the Greenwood smelter says it will be in operation by Jan. 1, 1901. He says the bulk of Boundary ores can be smelted without fluxing, and cites the Grand Forks smelter, now treating 300 tons of ore a day in one furnace, without using a pound of either iron ore or lime rock as flux. Slag is not even used, and only 10% of coke. The matte turned out carries 38% of copper. Mr. Johnson says that Boundary ore should be treated at a cost of $3 per ton.

DUTCH GUIANA.

J. H. Abbott of Paramaribo tells Two Republics that in washing for gold he has occasionally found diamonds—small ones —in the tailings, the last washings. In diamond mining the largest stones lie farthest down. Years ago a Mr. Fennelly, who was interested in gold mining with him, washed a large diamond from a pan of gravel. "Negroes do the work. We pay them 50 cents a day. It costs about 16 cents a day to maintain them. They can do work that a white man could never do, and live. All the labor there is contracted through the Government. The Government becomes a partner to the agreement, and any negro running away knows that he must settle with the Government. In gold mining we pay 5% of our returns to the Government, and a rental equivalent to about 1¾ cents per acre per year.

"When I arrived at Paramaribo I noticed the amount of gold brought into town by black men—not native Indians, for they worship gold as a god, and will not use it for barter and exchange, but black bushmen, men descended from the African negro. I found them coming down the rivers in dugouts, with bottles filled with gold dust. I made an expedition inland to a native village called Wakabashee. The trip was by river and took eighteen days. There I met an Englishman, the agent of an English mining company, who took me through the claims his company was working. I found antiquated methods in vogue, and much consequent loss and expense. They were not using mercury in their sluices and fully 50% of the gold which entered passed through and was lost.

"There are two gold belts, each about 25 miles wide, running from the coast inland across French, Dutch and British Guiana. The French, being nearest the seashore, was mined first. Then came the Dutch and finally the English sections. It was in the process of working those parts of the belts which came in the English colony that the recent diamond finds were made. It was purely accidental."

KOREA.

Chemulpo dispatches report the murder of Mr. Bland, employed at an American mine, by twenty-five Koreans, from an adjoining mine.

MEXICO.

In Chihuahua, W. B. Gester, manager quicksilver properties at Saucillo, has a new quicksilver plant ready to charge. The retorts are arranged to treat the high grade ores; capacity four tons daily. The properties are 2 miles from the main line of the Mexican Central.

George Kislingbury, formerly of the De La Mar, has a bond on a silver and gold-bearing property in Oaxaca, and is now operating it with 400 Mexican miners, the output going to custom smelters.

THE KLONDIKE.

Assistant Gold Commissioner Bell at Dawson has empowered himself to put up at public auction everything in the shape of a mining claim or mining prospect not otherwise owned than by the Government, and if such property is not sold at the regular monthly auction day in November, which is the 2d of that month, it will all be open to location by duly accredited miners having regularly issued licenses. In this list will be included those claims and fractions on Bonanza, El Dorado and Hunker creeks which were advertised some months ago to be sold at auction, but which were withdrawn just before the day of sale. It is thought that on the various main creeks the number of new claims will be from 5000 to 6000.

Personal.

J. M. CALLOW of Salt Lake City is in Montana.

D. G. LINARES has returned from Mexico to Victor, Colo.

N. P. DOOLEY has returned from Paris to De La Mar, Nev.

F. H. HARVEY of Galt, Cal., has returned from San Francisco.

HORACE F. BROWN is installing mining machinery at Lillooet, B. C.

JNO. H. IVEY is now local Supt. Superior G. M. Co., Boulder, Colo.

W. S. KEYES has returned to San Francisco from the City of Mexico.

E. D. TREADWELL has returned from San Francisco to Jerome, Ariz.

T. H. OXNAM has returned from France and is in Los Angeles, Cal., this week.

J. R. PHILLIPS, Supt. Amador Queen No. 2, Cal., mine, has returned from the East.

JNO. DERN of the Con. Mercur, Utah, Co., has returned to Salt Lake City from Europe.

A. SHARP of Rossland, B. C., is examining properties in the Pierre Lake, Wash., district.

E. H. TRERISE of the Madisonian, Mont., mine, is getting cyanide pointers at Mercur, Utah.

JAS. COLQUHOUN, manager Arizona Copper Co., has returned from Scotland to Clifton, Ariz.

C. A. MOLSON, consulting engineer of the Tom Boy mine of Telluride, Colo., is in Salt Lake City.

C. D. AKERS has been re-elected superintendent Hidden Treasure Grand M. Co., Placer county, Cal.

F. D. BAKER has completed the designs for the Eilers plant at Pueblo, Colo., and has returned to Denver.

W. B. MORSE succeeds M. J. Connor as general manager Canadian-American M. Co., Gribble Island, B. C.

F. W. WEGNER, Supt. Hoosier M. Co. Dewey, Idaho, will remain in Spokane, Wash., till March 1, 1901.

CHAS. LAUGHLIN has resigned superintendency of the Sumpter, Or., smelter, and goes to Mexico Dec. 1.

H. Z. OSBORNE has returned to Los Angeles from a visit to his mining properties in Trinity county, Cal.

W. E. DUNCAN has returned to Oroville, Cal., from inspection of his mining property in Plumas county.

J. C. WEATHERS, a mining engineer from Glasgow, Scotland, is expected in Tombstone, Ariz., on the 25th inst.

M. J. HELLER examined the Ferguson mine, Mariposa county, Cal., last week in the interest of the board of directors.

G. E. BAILEY, who is aiding in the development of the mineral resources of Trinity Co., Cal., is in San Francisco.

THOS. ELLIS, manager Southern Cross G. M. Co., has gone from Alameda, Cal., to his company's property in Oaxaca, Mexico.

D. B. HUNTLEY, general manager De Lamar mines, Idaho, is in Yankee Fork district, Idaho, examining mining property.

H. H. NICHOLSON of Denver, Colo., has returned from the Fra Cristobal mountains, New Mexico, where he had been examining a mine for the American Mining Investment Co. He is now investigating a group of copper prospects in Boulder county, Colo.

N. H. DARTON, of the U. S. Geological Survey, is at Custer, South Dakota, making an examination of the Grand Junction mine.

EDW. BIND, M. E., has returned to San Francisco from Coahuila, Mexico, after examining a coal basin for the Government.

WM. MELZCER of the Melzcer M. Co., Horcasitas, Sonora, Mexico, has given $5000 to the State of Sonora for public instruction.

O. J. SALISBURY of Salt Lake City, Utah, is looking after his mining interests in Deadwood, S. D. He is a Homestake stockholder.

R. C. GEMMELL of Salt Lake City, Utah, recently went into central California to make some mine examinations for English parties.

S. W. TRAYLOR, representing the Colorado Iron Works Co., Denver, Colorado, was in San Francisco this week and is now traversing Idaho.

VICTOR M. CLEMENT has returned to Salt Lake City from Mexico, after having examined some mines in the latter section for foreign parties.

U. G. REINARD, late of the Reward mine, Citrus, Inyo county, Cal., has gone to Quitovae, Mexico, to take charge of the mill work at the Pinton mines.

H. P. RICHMOND, manager of the mining machinery department of the Salt Lake Hardware Co., returned to Salt Lake City from Butte, Mont., on the 6th inst.

W. H. STORMS succeeds S. R. Porter as Supt. Balliol mines, Amador county, Cal. Mr. Porter will hereafter devote all his time to the Mutual mine superintending.

A. W. GEIST, formerly of Salt Lake City, is developing a mine at Ameca, Mexico, and building an electric railway 60 miles to the coast over which to transport the ores.

W. J. CASEY, president Union Gas Engine Co., San Francisco, has gone East on a business trip. He will stop over at Denver to attend the annual meeting of the Western Gas Association.

J. H. HAMMOND is in San Francisco, the first time for several years. Regarding the Camp Bird, Colorado, property, action has been delayed. He expects to be in California till November.

J. H. MUNNIK, late acting State mining engineer of the Transvaal, collected pianos in Johannesburg, mainly from the houses of mining officials, to prevent them being destroyed, by the efforts of the musical members of the German mine police, and sold about thirty in Pretoria at an average of $25 each.

Obituary.

WITH more than ordinary regret is chronicled the death of Alan Ward of Alameda, Cal., in Kiachta, Siberia, in the 23rd year of his age. He was the son of Capt. A. H. Ward, and went to Siberia in the early part of this year in the employ of an American mining company which had secured some mining concessions from the Russian Government. The caving of a gravel drift occasioned injuries which resulted in his death.

Books Received.

"Street Pavements and Paving Materials; Methods and Materials of Construction of City Pavements;" 8vo, 532 pages, 60 cuts, practical and of timely value to any one in any way interested in the subject; published by Jno. Wiley & Sons, N. Y. City. Price $4. Written by Geo. W. Tillson, C. E.

"Elements of Mineralogy, Crystallography, and Blowpipe Analysis," Alfred J. Moses and C. L. Parsons, a new and enlarged edition of this work, before favorably noticed. Parts I and IV are rewritten; parts II and III extensively revised. There are 664 figures and 413 pages of text. Published by the D. Van Nostrand Co., New York City. Price $2.00.

Catalogues Received.

The Diamond Drill and its Work is the title of a catalogue put out by the American Diamond Rock Drill Co., 120 Liberty street, New York City, describing the diamond drill of to-day, how it is made, what it is for, how it is used, what it costs, with illustrations of different makes and shapes, and testimonials from users concerning those drills.

A handsome trade treatise on Marsh Steam Pumps is issued by the American Steam Pump Co. The pamphlet shows evidence of great care in preparation and every detail is carefully worked out. The tables are full and accurate, the description studiously simple but exact, and the illustrations and typographical arrangement of high grade throughout. The Simonds Saw Co., 33 Market street, San Francisco, are Pacific coast agents for these steam pumps.

List of U. S. Patents for Pacific Coast Inventors.

REPORTED BY DEWEY, STRONG & CO., PIONEER PATENT SOLICITORS FOR PACIFIC COAST.

FOR WEEK ENDING OCTOBER 2, 1900.

658,935.—VENTILATOR—P. Abrahamson, S. F.
658,825.—POWER MECHANISM—J. Bean, Los Gatos, Cal.
658,753.—RAIL BOND—G. B. Blanchard, Seattle, Wash.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

WEAR ADJUSTING NUT FOR VEHICLE AXLES.—No. 658,500. Sept. 25, 1900. W. H. Holliway, Oakdale, Cal. The wear between the boxes and axles of vehicles soon makes the wheels loose upon the axles, and it is necessary to provide some form of adjustment by which this wear can be compensated for. This invention is designed for that purpose. It consists of a nut having a screw-threaded interior to fit the end of the shaft or axle, an exterior set or shoulder for a washer which fits against the end of the axle-box, and a chamber intermediate between the seat and the screw threads of such diameter as to receive the end of the axle. This interior chamber is fitted with a coil or other washer against which the shouldered end of the axle abuts when the nut is screwed into place. By removing portions of this washer from time to time, the nut will turn farther upon the axle and take up any wear between it and the axle-box or like part.

METALLIC LATHING AND FIREPROOF CONSTRUCTION FOR BUILDINGS.—No. 658,497. Sept. 25, 1900. M. Carrick, San Francisco, Cal. This invention relates to lathing and finishing for buildings of that class known as "metallic and fireproof finish." The object of this invention is to provide for the construction of complete walls, ceilings and partitions in which spaces are provided for deadening sounds, means for protecting the plaster, making the construction vermin-proof, means for providing air and ventilating spaces and passages through which conducting pipes or wires may be carried. It comprises essentially the parallel floor beams, with intermediate transverse beams, strips above the upper edges of the floor beams, and a body of plastic material filling the space and supporting the floor superstructure. The lower surfaces are arched and formed by metallic lathing, and a suitable plaster or other coating to complete the ceiling finish. Suitable openings are made through the metallic portions of the structure to allow the plastic material to pass through and unite.

HORIZONTAL EARTH DRILL.—No. 658,495. Sept. 25, 1900. H. E. Williams, San Jose, Cal. This device is designed to drill horizontally through the earth. It is especially useful for making connections between water and gas mains and like conductors which are laid in the street, and the buildings or points at the sides which require surface connections, and is designed to enable such connections to be made without disturbing the asphalt or other pavement with which the surface of the street may be covered. It consists of a frame adapted to be set in the line of the hole which is be drilled, a horizontal journal shaft carrying the boring tool at the front end, mechanism by which it is rotated and means for clearing the hole as it is bored, together with means for constantly advancing the boring tool until it reaches its destination.

DOOR OR WINDOW VENTILATOR.—No. 658,935. Oct. 2, 1900. Peter Abrahamson, San Francisco, Cal. This invention relates to the class of ventilators for window sashes, transoms, doors, and other similar communications between apartments and the outer air. It consists of a frame fixed in the ventilating opening having an outer fixed plate and screen continuation. A supplemental frame is fitted and hinged to the main frame and has a latch by which it may be opened and closed with relation thereto, said supplemental frame having a plate and screen continuation in reverse position to the first named plate whereby a tortuous passage is formed from the outside to the inside of the apartment. A slidable frame moves in guides upon the hinged supplemental frame, with direction pulleys at the top of said frame and cords connecting with the slidable frame pass over the direction pulleys to a point within reach of the operator. These cords pass through tubes or channels, and may be secured to holding devices when the slide has been moved to close the passage through the screen.

Latest Market Reports.

SAN FRANCISCO, Oct. 11, 1900.

SILVER—Per oz., Troy: London, 29⅝d (standard ounce, 925 fine); New York, bar silver, 63⅞c (1000 fine); San Francisco, 63¾c; Mexican dollars, 51c.

In an editorial on the rise of silver Bradstreets in the current issue thinks there is no longer any evidence of American speculative interest in silver. Handled as the bulk of the product of American mines and smelters now is, by combinations more or less allied in interest, there is practically no opportunity for speculation in silver. At the same time it may be doubted if the present method by which such a large proportion of the white metal produced in this country is put upon the market really makes much difference in the commercial prices, owing to the fact that the activity which prevails in our copper producing industries and in other sources from which silver is produced creates a constant supply and prevents any very marked holding back of the current stock of the metal for the purpose of affecting quotations. It may furthermore be noted that the presence of the silver coinage issue as one of the elements in the present political campaign in the United States can hardly be looked on as having had any bearing upon the action of the silver market either in New York or London. The chances of an administration in the United States favorable to a return on the part of our Government to a free silver coinage policy have hardly been considered in the current discussion by the European financial press of the tendencies of the silver market or been effective in connection with the recent disposition it has shown to become stronger and to advance.

One of the chief influences governing the silver market has been the demand for China created by the military operations and the suspension of the import trade of that country. At the same time, the leading authorities on the subject give the first place to the demand of the Indian government, and it would also seem that the British financial authorities have bought more or less silver for subsidiary coinage in connection with the large expenditures occasioned by the war in South Africa. In fact, this South African demand has been described as furnishing the occasion for no small proportion of the strength of the London silver market during the last month or so. It is to India, however, that most of the recent buying of silver is attributed. The government of that country has found itself confronted with a real scarcity of rupees for circulating purposes. It must not be supposed that the change in the currency policy of India in recent years has had any effect on the habits of the native population of England's eastern dependency. On the contrary, the Hindoos have gone on melting down rupees for the purpose of personal ornamentation, and also have continued to hoard the silver coinage in preference to any other form of money or visible wealth. This has resulted in a diminution of the supply of actual money, and has forced the Indian government to meet it by large purchases of bar silver to be coined into rupees and put in circulation. The Government and the exchange banks have both been buyers in the London market, some of the recent heavy purchasing orders being openly attributed to the Indian Council for use by the mints. At the same time, the more satisfactory crop prospects and the better financial position of the population of India have tended to create a renewed demand for silver bars, of which a considerable quantity have been exported from London to the East. According to the figures, which are accepted as official, the total shipments of silver from the British capital to the East up to the beginning of October have this year attained a value of over £6,000,000, as compared with only £4,000,000 in the corresponding nine months of last year. Allowing for the increased Chinese demand, these figures point to a decidedly better absorption of silver by India.

COPPER.—New York: Lake, 1 to 3 casks, $17.00 cash; carload lots, 16.75; Electrolytic, 1 to 3 casks, 16.87½; carload lots, 16.62½; Casting, 1 to 3 casks, 16.75; carload lots, 16.62½. San Francisco: 18. Mill copper plates, 20c; bars, 22@23c.

LEAD.—New York, $4.35; Salt Lake City, $4.25; St. Louis, $4.30; San Francisco $5.00, carload lots; 5½c 1000 to 4000 lbs.; pipe 6¾, sheet 7½, bar 6c; pig, $4.70 @5.10. London, £18=3.91c per ℔.

SPELTER.—New York, $4.10; St. Louis, $3.95; San Francisco, ton lots, 5½c; 100-lb lots, 5¾c.

ANTIMONY.—New York, Cookson's, 10½c; Hallett's, 9½c; San Francisco, 1000-lb lots, 12c; 300 to 500 lbs., 13@14c; 100-lb lots, 15@18c.

IRON.—Pittsburg, Bessemer pig, $13.75; gray forge, $13.25; San Francisco, bar, per lb., 2.50c in small quantities.

STEEL.—Bessemer billets, Pittsburg, $17.00; sheet bars, $21.75; San Francisco, bar, 7c to 12c per lb.

TIN.—New York, pig, $29.50; San Francisco, ton lots, 31c; 1000 ℔s., 31¼c; 500 ℔s., 31½c; less, 32c; bar tin, ⅌ ℔, 34½c.

QUICKSILVER.—New York, $51.00; large lots: London, £9 2s 6d; San Francisco, local, $48.50 ⅌ flask of 76½ ℔s.; Export, $45.

NICKEL.—New York, 50@60c ⅌ ℔.

MAGNESIUM.—New York, $3.00 ⅌ ℔.; San Francisco, $4.00.

ZINC.—San Francisco, 5¼c; slab, 6c; bar, 7¾c.

SOLDER.—Half-and-half, 100-℔. lots, 19½c; San Francisco, Plumbers', 100-℔. lots, 16.40c.

BABBITT METAL.—San Francisco, No. 1, 10c.

ASSAY LITHARGE.—San Francisco, 10c ⅌ ℔, small lots.

BISMUTH.—New York, ⅌ ℔., $1.60 50-℔ lots; San Francisco, $2.50 to $2.75 ℔ lots.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 35c.

PHOSPHORUS.—F. o. b. New York 50@60c ⅌ ℔.

TUNGSTEN.—New York, ⅌ ℔., 95c; San Francisco, $1.15.

FERRO-TUNGSTEN.—New York, 37%, 35c; San Francisco, 65c (60%).

FERRO-MANGANESE.—Pittsburg, 80%, domestic, $85, large lots.

PLATINUM.—San Francisco, crude, $17 ⅌ oz.; New York, $18.20 per Troy oz.

POWDER.—F. o. b. San Francisco: No. 1. 70% nitro-glycerine, per ℔., in carload lots, 15¼c; less than one ton, 17¼c. No. 1*, 60%, carload lots, 13¼c; less than one ton, 15½c. No. 1** 50%, carload lots, 11¾c; less than one ton, 13¾c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2 per keg.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9, in lots not less than 1000.

FUSE.—Triple tape, $3.60 per 1000 feet; double tape, $3.00; single tape, $2.65; Hemp, $2.10; Cement No. 2, $3.00; Cement No. 1, $2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 11¾c ⅌ set; 14 oz., 40s., 10½c.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 32½@33½c ⅌ ℔.; carloads, 30@31c; in 10-℔. tins, 40c; sulphuric acid, 66% B, 2c ⅌ ℔.; soda ash, $1.60 ⅌ 100 ℔s. 58%; hyposulphite of soda, 2¾@3c ⅌ ℔.; blue vitriol, 5½@6c ⅌ ℔.; borax, concentrated, 7@8c ⅌ ℔.; chlorate of potash, 12@13c; roll sulphur, 6c; alum, $1.90@2.00; flour sulphur, French, 2¼@2½c; California refined, 1¾@2c; nitric acid, in carboys, 8c ⅌ ℔.; caustic soda, in drums, 3@4c ⅌ ℔.; Cal. s. soda, bbls., $1.00; sks, 95c ⅌ 100 ℔s.; chloride of lime, spot,

$2.50@2.60; nitrate of potash, in kegs, 8c; caustic potash, 10c in 40-lb. tins.

OILS.—Linseed, pure, boiled, bbl., 75c; cs., 80c; raw, bbl., 73c; cs., 78c. Deodorized Stove Gasoline, bulk, 15c; do., cs., 21c; 86° Gasoline, bulk, 21c; do., cs., 27c; 63° Naphtha or Benzine, deodorized, in bulk, per gal., 14c; do., in cs., 20c; Lard Oil, Extra Winter Strained, bbl., 70c; cs., 75c; No. 1 bbl., 50c; cs., 55c; Neatsfoot Oil, coopers' bbls., 60c; extra bbls., 65c; cs., 60c; No. 1 bbl., 52½c; cs., 57½c.

COAL. — San Francisco, coast, yard prices: Wellington, $9; Seattle, $7.00; Coos Bay, $5.50; Southfield, $9.00. Cargo lots, Eastern and foreign: Wallsend, $8.00; Brymbo, $7.50; Pennsylvania, hd., $14.00; Scotch, $8; Cumberland, $12; Cannel, $9.50; Welsh Anthracite, $12.00; Rock Springs, $8.50; Colorado Anthracite, $14.50. Coke, $16 per ton in bulk; $18 in sacks.

SITUATIONS WANTED.

SITUATION WANTED BY MILLMAN. Have had 20 years of practical experience. Understands thoroughly pan or battery amalgamation, concentration, belts and machinery. Able to take charge of a mill or any job in a mill anywhere. Best of recommendations. Address Box 4. Virginia City, Nevada.

GRADUATE MINING ENGINEER, five years field work, surface and underground, familiar with cyaniding, surveying and draughting, desires position after Nov. 1st as Assayer and Chemist or Ass't Supt. A1 references as to ability and character. Salary small object; opportunity to prove ability considered more important. Address B. F., care this office.

WANTED.—SITUATION BY A MAN OF EXperience who is competent to take charge of a gold mine. Understands assaying, surveying, and has business qualifications. Best of references as to character and ability. Address K. C., this office.

SITUATION WANTED by a first-class miner with years of experience; up to date in timbering and working a mine; handles men with skill and economy; understands modern milling and concentrating; with business ability; best of references. Address Superintendent or Foreman. care this office.

MINING ENGINEER (technical training), twenty years' experience as surveyor, assayer, superintendent and manager of mines and mills; business qualifications; linguist; at present general manager mining and milling proposition in Mexico; desires to make a change on account of health; best references. Address S. O., Mining and Scientific Press.

WANTED SITUATION
AS MILLMAN, FOREMAN, OR ASSISTANT.
Have had eight years' experience with one of the largest mining companies in Idaho, in pan amalgamation, cyaniding and refining of bullion. Ability to do assaying. Refer to De Lamar Mining Co., De Lamar, Idaho. Address W. H., this office.

Quicksilver
—FOR SALE BY—
The Eureka Company,
OF SAN FRANCISCO.
ROOM 1, - - 320 SANSOME STREET, SAN FRANCISCO.

THE CALIFORNIA DEBRIS COMMISSION, HAVING received applications to mine by the hydraulic process from the Dewey Consolidated Gravel Mining Co., in the Homeward Bound, Evening Star and Morning Light Mines, near Iowa Hill, Placer Co., to deposit tailings in Indian Canyon; from Mary E. Ruth et als., in the Buckeye Mine, near North San Juan, Nevada Co., to deposit tailings in a worked-out pit; from the Ralston Divide Gold Mining Co., in the Pat Goggins and Blacksmith Flat Mines, near Virner, Placer Co., to deposit tailings in Long Canyon; from Nathan Gardiner, in the Sidney Placer Mine, near Igo, Shasta Co., to deposit tailings in Sidney Gulch; and from A. W. Whitney and C. Y. Hepler, in the Miocene Mine, near Crescent Mills, Plumas Co., to deposit tailings in Rush Creek, gives notice that a meeting will be held at Room 59, Flood Building, San Francisco, Cal., on October 15, 1900, at 1:30 P. M.

WE BUY very rich Ores, Dental Scraps, Tellurium Ores, Mill Wastes, Jewelers' Sweeps, Gold Retorts, Old Iron Retorts, Base Amalgam, Quicksilver, Amalgamated Plates, Gold and Silver, Old Slags.

For Sale in Lots to Suit.
REDINGTON & COMPANY, Wholesale Druggists, 23-25-27 Second Street, San Francisco.

WANTED.

WANTED.---A NEW OR SECOND-HAND 15 H. P. GASOLINE HOIST.
Keystone Con. Mining Co., Amador City, Cal.

WANTED.—METALLURGIST CAPABLE OF taking charge of 40-ton copper furnace using charcoal fuel, situated in Mexico. State experience and wages wanted; references. Address "Metallurgist," Mining and Scientific Press.

INFORMATION WANTED
regarding whereabouts of John R. Williams, about 70 years old. Last heard of as Supt. of a mine in Copper's Hill, Vermont, in 1866. Has an adopted son about 32 years old. Supposed to be placer mining in the West, possibly California. $25.00 reward at Deseret News Office, Salt Lake City, Utah.

WANTED.
Experienced Promoter and Stock Operators
to handle the sale of stock for an oil company. State previous experience.
For particulars, address
C. J. TALLON,
308 Market Street,........San Francisco, Cal.

Experienced Coal Miners
can secure steady employment either on contract or by day's work at the TESLA COAL MINES, Tesla, Alameda County, California. Good wages guaranteed, also good board. Good climate, and also good accommodations and houses for families.
For further particulars, please apply to the Superintendent at the Mines, or to the Company at 328 Montgomery St., San Francisco, Cal.

REFRACTORY ORES
WANTED.
1000 TONS or more which will assay $75.00 Gold per ton and over, delivered free of charge at San Francisco, Cal. Correspondence solicited.
C. J. TALLON,
308 MARKET STREET, SAN FRANCISCO, CAL.

FOR SALE.

For Sale or Bond---Very High Grade Copper Property Located in Arizona.
JOHN M. VRCHOTA, La Crosse, Wis.

A group of 12 Colorado high-grade gold mines are now offered for sale for the first time. Wide veins of rich, free-milling ore. Plenty of wood and water. Good roads, and near R. R. station. Title U. S. Patents. Capitalists or their special agents only need apply. Buyer and seller brought together for negotiations. Address E. J. FRASER (sole agent for owners), Room 522, Parrott Building. S. F., Cal.

FOR SALE.
Lease and Bond, Eighteen Months, Fasy Terms, Copper Property, New Mexico
High grade ore with good gold values. Accessible. Plenty wood and water. Strong vein. Three shafts. Will pay from start. Adjoins large producing mine. H. B. RUNKLE, El Paso, Texas

Hoist on Hand for
Immediate Shipment.
A first-class Steam Hoist, double 10x12 cylinders, drums 48″ dia. by 30″. For specifications, price, etc., address Mining and Scientific Press.

FOR SALE.
A JACOBS CONCENTRATOR, been used about four months.
Also a fine O. & S. ENGINE, 25 H. P.
25 H. P. BOILER, used about six months, in good order and condition
Also a 40 H. P. ENGINE, now running and can be seen in motion.
Address E. D. BAKER, YREKA, CAL.

FOR SALE,
Lease or Bond, 6 Months' Time.
80,000 acres of timber lands at La Tesca Municipality, Ahuacatlan, Tepic, with mineral deposits—gold, silver, zinc and land. Water power close to the mines. Address to
ELIAS GALINDO, Box 26, Tepic, Mexico.

FOR SALE.
FILTER PRESS.
Johnson, 24-chamber, acid proof, washing Filter Press, 24-in. square plates. Nearly new.
THE S. H. SUPPLY CO.
WRITE FOR CATALOGUE OF MINING MACHINERY AND SUPPLIES.
22nd and Larimer Sts., DENVER, COLO.

SPIRAL SAND PUMPS.
For Pumping Sand, Slimes, Tailings and Crushed Ores.
The Cheapest and Most Durable Pump on the Market. Manufactured by J. H. Frenier & Son.
Represented by M. S. HAUSER,
12 Front Street,............San Francisco, Cal.

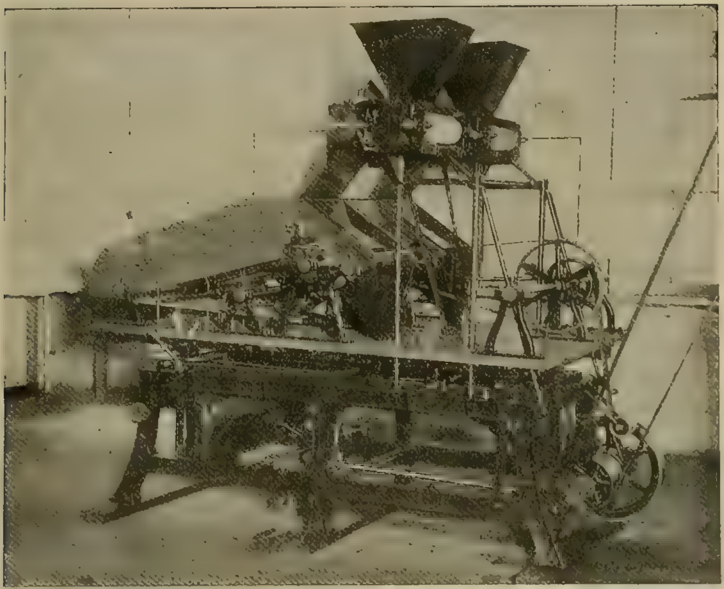
CROWN GOLD MILLING CO.

Manufacturers of the "CROWN" CONCENTRATOR and CROWN ORE SIZER. A dry process of sizing and concentrating ore, sand or gravel. Designed to accord fully with the laws of specific gravity, and especially adapted to refractory ore or localities where there is no water.

The chief claims for the Crown Concentrator are that it occupies less floor space and has nearly four times the capacity of any wet concentrator; that it will concentrate ores containing base and refractory metals that ordinarily slime and carry off values; that it effects a saving of values far above the ordinary methods of concentration.



We have, now in operation, a complete plant for crushing, sizing and concentrating ores by the

Crown Dry Milling Process.

Mine owners desiring tests made can forward us, freight prepaid, not less than 1000 lbs. nor more than 4000 lbs. of sample, for which a charge of $20 will be made. (This amount includes assaying, etc.)

Ores for which this process is adapted and of which consignments are solicited are any concentratable ores, pulps, tailings, or sands, carrying sufficient values, whether they have heretofore been profitably concentrated or not.

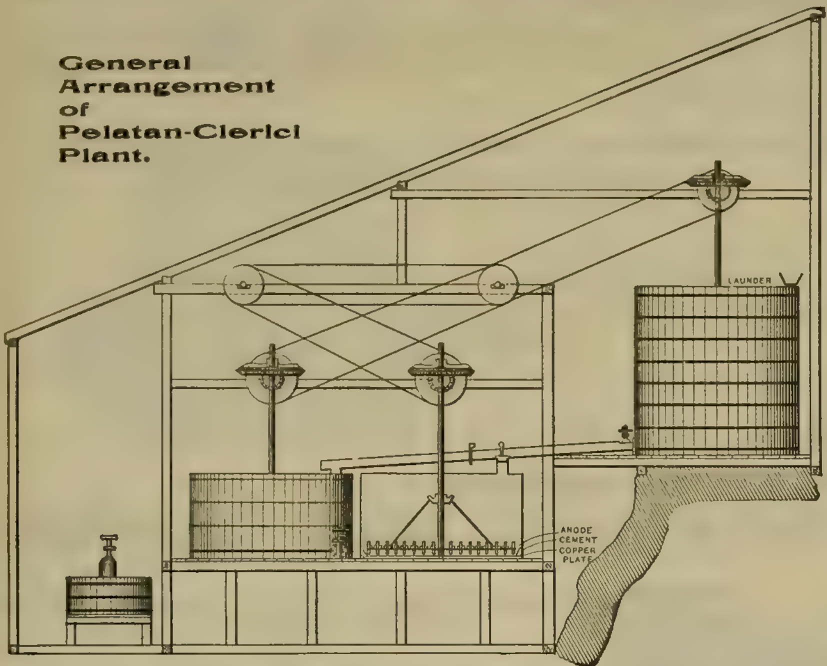
THE "PELATAN-CLERICI" PROCESS

OF TREATING REFRACTORY ORES



General Arrangement of Pelatan-Clerici Plant.

Saves the precious metals by the simplest, most economical and most efficient process known. No roasting or previous treatment, except ordinary crushing. Extraction complete in from 6 to 12 hours. Extracts equally well both fine refractory gold and coarse gold in the form of amalgam. Makes a greater saving of gold than any other process from raw material at less cost. The electric current and dissolving agent promptly dissolve the precious metals, both gold and silver. Samples of ore tested free of charge. Several mills saving over 90 per cent of values by bullion returns. Simplicity. Economy. Efficiency.

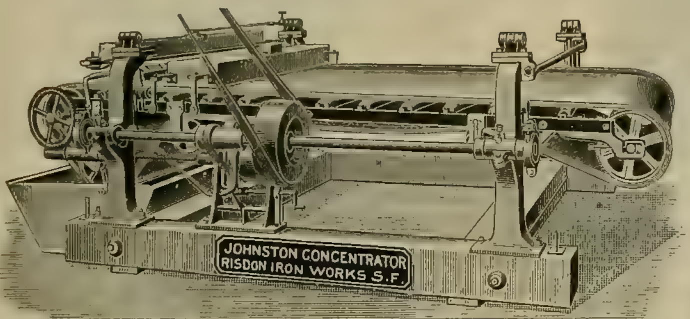
AGENTS.

The JOHNSTON CONCENTRATOR.



DURABILITY, CAPACITY AND SIMPLICITY
: : ARE ITS ESSENTIAL POINTS. : :

SAVES MORE VERY FINE SULPHURETS
THAN ANY OTHER CONCENTRATOR MADE.

The Johnston Concentrator is slung with arms from above on an angle, giving it the oscillating motion that makes it a perfect machine. This undulating motion immediately settles the sulphurets, retaining all amalgam, leaving sulphurets very clean, one 6-ft. Johnston doing the work of two 4-ft. belt machines.

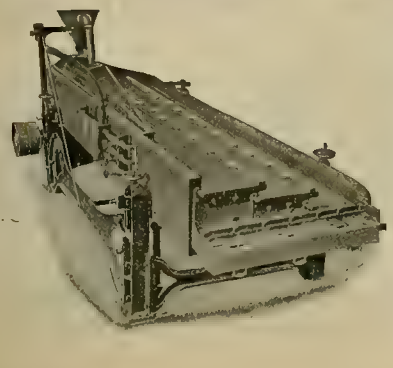
THE IMPROVED BARTLETT CONCENTRATING TABLE.



The BARTLETT CONCENTRATING TABLE has been GREATLY IMPROVED recently by the substitution of iron in place of wood wherever possible. It is now built with SOLID IRON TOP, PLANED TO A TRUE SURFACE AND POLISHED; all parts are made by template and EACH PART BEING INTERCHANGEABLE. As now constructed, the table has no special wearing parts and will last for many years. It has a CAPACITY OF FROM FIFTEEN TO FORTY-FIVE TONS IN TWENTY-FOUR HOURS, according to the class of ore worked. It is the only table in the world which will take the place of jigs and do away with all costly and complicated machinery.

It is Especially Designed for Separating Zinc from Lead.

Send for our illustrated catalogue, containing all the latest information on the concentration of ores.

GATES FINE CRUSHER.

The result of ten years' solid work. Success at last. What we wanted, and the public demanded, was a Gates Gyratory Rock and Ore Breaker (always adjustable and indestructible) so modified in design as to make one-half-inch product from three-inch sizes, rapidly and cheaply. The H. Fine Crusher will do this work. It takes the place of expensive big rolls and often prepares ore, without further crushing, fine enough for coarse concentration or cyaniding. In any event, it is the greatest and best intermediate machine between the coarse breaker and the pulverizer.

Ask for No. 1 Catalogue. :: **GATES IRON WORKS,** Dept. UU, 650 Elston Ave., CHICAGO.

THE GRIFFIN
THREE ROLLER
ORE MILL.

The Griffin Three Roller Ore Mill is a simply constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilian Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

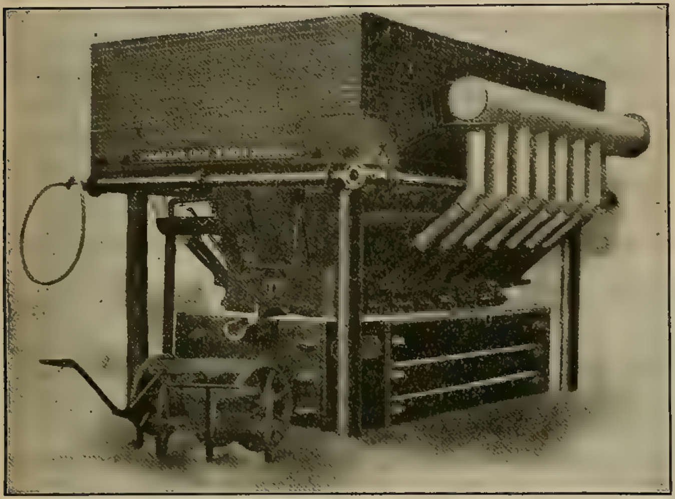
THE COLORADO IRON WORKS COMPANY,



ENGINEERS AND MANUFACTURERS OF

Smelting Furnaces and Equipments.

In this advertisement we show cut of a recent Silver-Lead Cast Iron Water Jacket Furnace. Some metallurgists prefer jackets made of steel plates, and under some conditions plate copper is demanded, although more expensive. Most of the important smelters are using cast-iron jackets now, hence we give prominence to that material. There are absolutely no conditions in blast furnace practice but are as well subserved by properly proportioned cast-iron jackets, as by those of any other material.

Write for our catalogue, showing many different styles of smelters for the treatment of

GOLD, SILVER, LEAD, COPPER AND NICKEL ORES,

also the latest and best method for the economical use of jacket water (a saving of 80% to 90% guaranteed) by our patented

WATER VAPORIZING ATTACHMENT.

We design, manufacture and erect Mills for Concentration and Amalgamation, Milling, Chlorination and Cyanide Processes. In writing for information, give us the analysis or character of the ore to be treated, to enable us to intelligently arrive at the proper method.

Our very complete catalogue of CRUSHING MACHINERY will be sent on application.

THE FULTON VARIABLE MOTION CONTINUOUS FLOW MINING PUMP.

Delivers a continuous stream with absolutely no water hammer so common with all other makes of pumps. Is particularly adapted to be driven by electric power, for the reason the resistance to motive power is almost uniform. I manufacture the **FULTON PUMP** in four sizes, ranging from 10 H. P. work to 50 H. P. work.

WRITE ME FULL PARTICULARS IN REGARD TO YOUR REQUIREMENTS.

The above cut is made from a photograph taken of a No. 3 FULTON PUMP at work on the 600 ft. level in the Tesla Mine at Tesla, Alameda Co., Cal.

Read what MR. O. NEWHOUSE, Consulting Engineer of the S. F. & S. J. Coal Co., has to say in regard to it.

OFFICE S. F. & S. J. COAL CO., TESLA, ALAMEDA CO., CAL., July 13, 1900.

Mr. A. T. Ames, Galt, Cal.—DEAR SIR: Replying to your favor of recent date, regarding the working of the Fulton Pump bought of you, will say: The pump is one of your No. 3 pumps, working in connection with a Fulton Double X, double plunger cylinder 5 in. diameter by 110 in. long; stroke of each plunger 2 ft. This pump is installed in our mine on the 600 ft. level, directly over our sump, and is forcing the water to the surface at one lift. We drive the pump with an electric motor, 30 H. P., direct connected to the pump with gear and pinion, and I am pleased to submit the following statement of duty:

Length of 6 in. column leading up incline to surface	805 ft.
Perpendicular head	640.88
Gauge pressure, actual	275 lbs.
" " theoretical	278.14 "
Barometer at pump	29 58 in.
" point of discharge	28.95 "
Temperature air	58 deg.
" water	76 "
Strokes double per minute, 2 ft	25
Discharge, measured by box center thereof, under 5 in. head, equal to 1⅛ cu. ft., equal to gallons per hour	4725
Diameter of pump cylinder	5 in.
Net area of pump cylinder after deducting area of piston	17.868 sq. in.
Efficiency of pump when working under above conditions	84 8) per ct.

To say that we are highly pleased with our pump expresses it very mildly.

Signed, O. NEWHOUSE, Consulting Engineer S. F. & S. J. Coal Co.

Manufactured and Sold by A. T. AMES, Galt, Cal.

THE

Pelton Water Wheel Company

Gives exclusive attention to the development and utilization of water powers by the most modern, economic and improved methods. An experience of more than fifteen years, involving both the theory and practice of hydraulic engineering as relates to power development in its widest range of application, is at the service of its customers.

Nine Thousand Wheels Now Running,

Averaging some 700,000 H. P.

ELECTRIC POWER TRANSMISSION.

Pelton wheels afford the most reliable and efficient power for such service and are running the majority of stations of this character in the United States, as well as most foreign countries. Highest efficiency and absolute regulation guaranteed under the most extreme variations of load.

The Pelton Water Wheel Company,

121 & 123 MAIN STREET, SAN FRANCISCO, CAL.

THE HUG WATER WHEEL

has a guaranteed **EFFICIENCY OF 86%**, as shown by Test Curves from Cornell University.

WRITE FOR INFORMATION AND PRICES.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & CO.'s Patent Agency will have the benefit of a description in the *Mining and Scientific Press.* We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

DEWEY, STRONG & CO.,
